NOTICE

Lexi-Drugs Online

This data is intended to serve the user as a handy reference and not as a complete drug information resource. It does not include information on every therapeutic agent available. The publication covers over 1700 commonly used drugs and is specifically designed to present important aspects of drug data in a more concise format than is typically found in medical literature or product material supplied by manufacturers.

The nature of drug information is that it is constantly evolving because of ongoing research and clinical experience and is often subject to interpretation. While great care has been taken to ensure the accuracy of the information and recommendations presented, the reader is advised that the authors, editors, reviewers, contributors, and publishers cannot be responsible for the continued currency of the information or for any errors, omissions, or the application of this information, or for any consequences arising therefrom. Therefore, the author(s) and/or the publisher shall have no liability to any person or entity with regard to claims, loss, or damage caused, or alleged to be caused, directly or indirectly, by the use of information contained herein. Because of the dynamic nature of drug information, readers are advised that decisions regarding drug therapy must be based on the independent judgment of the clinician, changing information about a drug (eg, as reflected in the literature and manufacturer's most current product information), and changing medical practices. Therefore, this data is designed to be used in conjunction with other necessary information and is not designed to be solely relied upon by any user. The user of this data hereby and forever releases the authors and publishers of this data from any and all liability of any kind that might arise out of the use of this data. The editors are not responsible for any inaccuracy of quotation or for any false or misleading implication that may arise due to the text or formulas as used or due to the quotation of revisions no longer official.

Certain of the authors, editors, and contributors have written this book in their private capacities. No official support or endorsement by any federal or state agency or pharmaceutical company is intended or inferred.

The publishers have made every effort to trace any third party copyright holders, if any, for borrowed material. If they have inadvertently overlooked any, they will be pleased to make the necessary arrangements at the first opportunity.

If you have any suggestions or questions regarding any information presented in this data, please contact our drug information pharmacists at

1-877-837-LEXI (5394)

PREFACE

Lexi-Drugs Online

We are fortunate to live in an age where medications are readily available to prevent, treat, and cure a wide variety of conditions. Drugs can also improve the quality of life and prolonging independence. Pharmaceutical innovation continues, and new medications will continue to play an important role in improving the health.

However, new discoveries continue to increase the complexity of medical treatment, as well as monitoring of response. This complexity of therapy often increases the potential for interactions, adverse reactions, and medication errors. Healthcare providers must continually assess the potential risks and benefits of individual medications, as well as the complete therapeutic regimen as it relates to an individual patient.

New molecular entities, new warnings, new interactions and additional drug experience continue to expand, presenting a challenge to maintain a current knowledge base concerning medications. It remains the goal of the authors of Lexi-Comp, Inc to provide you, the user, with the critical information regarding pharmacology and the therapeutic use of drugs in a concise compendium, designed for ease of use by a variety of healthcare professionals. We trust you find the information useful and balanced, and further hope it will assist you in your therapeutic decision-making and drug-therapy monitoring.

DESCRIPTION OF FIELDS

Lexi-Drugs Online

Generic Name	U.S. or Canadian adopted name.
ALERT: U.S. Boxed Warning	The FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.
Special Alerts	Important information (new warnings, adverse reactions, etc) to be conveyed to clinicians expeditiously.
Medication Safety Issue	In an effort to promote the safe use of medications, this field is intended to highlight possible sources of medication errors such as sound-alike/look-alike drugs or highly concentrated formulations which require vigilance on the part of healthcare professionals. In addition, medications which have been associated with severe consequences in the event of a medication error are also identified in this field.
Pronunciation	Phonetic pronunciation guide.
Brand Names	
U.S. Brand Names	Trade names found in the United States (manufacturer-specific).
Canadian Brand Names	Trade names found in Canada.
Pharmacologic Category	Unique systematic classification of medications.
Uses	
Use: Labeled Indications	Information pertaining to approved FDA- or Canadian-approved indications for the drug.
Use: Unlabeled/Investigational	Information pertaining to unlabeled or investigational indications of the drug.
Use: Dental	Information pertaining to appropriate dentistry-specific indications of the drug.
Dosages	
Dosing: • Adults • Elderly • Pediatric • Renal Impairment • Hepatic Impairment	The amount of the drug to be typically given or taken during therapy for children and adults; also includes any dosing adjustment/comments for renal impairment or hepatic impairment and other suggested dosing adjustments (eg, hematological toxicity). Combination regimens identify how the drug may be used in combination with other agents for the treatment of neoplastic disease. Calculations relevant

• Adjustment for Toxicity • Combination Regimens • Calculations	to dosing are also provided.
Oncology: Bone Marrow - High Dose	Chemotherapy doses 1.5- to 30-fold greater than standard dosages. Nonhematologic adverse reactions are dose-limiting.
Administration and Storage Issues	
Administration: • I.M. • I.V. • I.V. Detail • Oral • Inhalation • Topical • Other	Information regarding the recommended final concentrations, rates of administration for parenteral drugs, or other guidelines when giving the medication.
Dietary Considerations	Specific dietary modifications and/or restrictions.
Storage Reconstitution Compatibility	Information regarding storage and stability of product and reconstitution guidance (where necessary). Provides the time and conditions for which a solution or mixture will maintain full potency. For example, some solutions may require refrigeration after reconstitution while stored at room temperature prior to preparation. Also includes compatibility information, when available, for admixtures, Y-site administration, and syringe storage.
Extemporaneously Prepared	Directions for preparing liquid formulations from solid drug products. May include stability information and references.
Warnings & Precautions	
Restrictions	The controlled substance classification from the Drug Enforcement Agency (DEA). U.S. schedules are I-V. Schedules vary by country and sometimes state (eg, Massachusetts uses I-VI). May also include restricted availability information.
Contraindications	Information pertaining to inappropriate use of the drug as dictated by approved labeling.
Allergy Considerations	Information relating to spectrum of reactions noted with a true drug allergy; also describes timing of reactions, potential for cross-hypersensitivity, and patient management considerations.
Warnings/Precautions	Precautionary considerations, hazardous conditions related to use of the drug, and disease states or patient populations in which the drug should be cautiously used. Boxed warnings, when present, are clearly identified and are adapted from the FDA approved labeling. Consult the product labeling for the exact black box warning through the manufacturer's or

	the FDA website.
Geriatric Considerations	Pertinent information specific to older adults.
Pregnancy & Lactation	
Pregnancy Risk Factor	Five categories established by the FDA to indicate the potential of a systemically absorbed drug for causing risk to fetus.
Pregnancy Considerations	A summary of human and/or animal information pertinent to or associated with the use of the drug as it relates to clinical effects on the fetus, newborn, or pregnant women.
Lactation	Indicates if the drug listed in the monograph is present in breast milk and the manufacturers recommendation for use while breast-feeding (where recommendation of American Academy of Pediatrics differs, notation is made).
Breast-feeding Considerations	Information pertinent to or associated with the human use of the drug as it relates to clinical effects on the nursing infant or postpartum woman.
Pregnancy & Lactation, In-Depth	Detailed information on the effects of the medication on the fetus, newborn, and/or breast-feeding infant, as well as use of the drug in pregnant and postpartum women.
Adverse Reactions	
Adverse Reactions	Side effects are grouped by percentage of incidence (if known) and/or body system, <1% effects are grouped only by percentage (Note: Includes postmarketing and/or case report information if available).
Oncology-related Reactions	
Oncology: Vesicant	Indicates whether the drug is considered to be a vesicant and likely to cause significant morbidity if the infusion infiltrates soft tissues.
Oncology: Emetic Potential	Likelihood that the drug will cause nausea or vomiting.
Oncology: Bone Marrow - Unique Toxicity	Nonhematologic adverse reactions that occur commonly with, or are unique to, high-dose chemotherapy administration.
Interactions	
Metabolism/Transport Effects	If a drug has demonstrated involvement with cytochrome P450 enzymes, or other metabolism or transport proteins, this field will identify the drug as an inhibitor, inducer, or substrate of the specific enzyme(s) (eg, CYP1A2 or UGT1A1). CYP450 isoenzymes are identified as substrates (minor or major), inhibitors (weak, moderate, or strong), and inducers (weak or strong).
	This field presents a description of the interaction

Drug Interactions	between the drug listed in the monograph and other drugs or drug classes. Following a description of the interaction for a drug class, any drugs from that class which are NOT likely to cause a similar interaction with the monograph drug are listed as exceptions. Lastly, the significance of the interaction is identified in the form of a risk rating. A brief description of the rating system is as follows (please note that the risk levels of *A* and *B* exist, reflecting no known interactions or clinically-insignificant interactions, respectively; however, for brevity, these interactions are not displayed in printed form: *Risk C: Monitor therapy* – data demonstrate that the specified agents may interact with each other in a clinically-significant manner, but the benefits of concomitant use usually outweigh any risks. An appropriate monitoring plan should be implemented to identify potential negative effects and dosage adjustments may be needed in a minority of patients. *Risk D: Consider therapy modification* - data demonstrate that the specified agents may interact with each other in a clinically-significant manner and patient-specific assessment must be conducted to determine whether the benefits of concomitant therapy outweigh the risks. Specific actions must be taken in order to realize the benefits and/or minimize toxicity of concomitant use. *Risk X: Avoid combination* - data demonstrate that the specified agents may interact with each other in a clinically-significant manner and the risk generally outweighs any potential benefit. Concurrent use of these agents is generally considered contraindicated.
Ethanol/Nutrition/Herb Interactions	Presents a description of the interaction between the drug listed in the monograph and ethanol, food, or herb/nutraceuticals.
Test Interactions	Listing of assay interferences when relevant.
Patient & Therapy Management	
Monitoring Parameters	Laboratory tests and patient physical parameters that should be monitored for safety and efficacy of drug therapy.
Reference Range	Therapeutic and toxic serum concentrations listed including peak and trough levels.
Nursing Considerations	
Nursing: Physical Assessment/Monitoring	Monitoring guidelines for laboratory tests and patient physical parameters; includes caregiver guidance relating to administration issues and patient teachings that facilitate safe and efficacious therapy.
Monitoring: Lab Tests	Suggested laboratory tests to monitor for safety and efficacy of the drug.
Patient Education	Specific information pertinent for the patient.
Preparations	
Product Availability	Provides availability information on products that have been approved by the FDA, but not yet available for use. Estimates for when a product may be available are included, when this information is known. May

	also provide any unique or critical drug availability issues (eg, drug shortage of a critical drug).
Dosage Forms	Information with regard to form, strength, and availability of the drug. Note: Additional formulation information (eg, excipients, preservatives) is included when available. Please consult product labeling for further information.
Generic Available	Indicates availability of generic product(s).
Manufacturer	Identifies product manufacturer only if there is a sole supplier.
Pricing: U.S. (www.drugstore.com)	Third party supplier of drug pricing based on estimated average retail prices.
Pharmacology & Pharmacokinetics	
Mechanism of Action	How the drug works in the body to elicit a response.
Pharmacodynamics/Kinetics	The magnitude of a drug's effect depends on the drug concentration at the site of action. The pharmacodynamics are expressed in terms of onset of action and duration of action. Pharmacokinetics are expressed in terms of absorption, distribution (including appearance in breast milk and crossing of the placenta), protein binding, metabolism, bioavailability, half-life, time to peak serum concentration, and elimination.
Pearls and Related Information	
Related Information	Cross-reference links to other pertinent, related drug information.
Pharmacotherapy Pearls	Information about sodium content and/or pertinent information about specific brands.
Dental Info	
Dental Health Professional Considerations	Pharmacology-related comments and considerations relevant to the dental professional.
Dental Health: Effects on Dental Treatment	Specific information for the dental professional on how drug therapy affects the dental treatment/diagnosis with suggested management approaches.
Dental Health: Vasoconstrictor/Local Anesthetic Precautions	Specific information for the dental health professional to prevent potential drug interactions related to anesthesia.
Mental Health Info	
Mental Health: Effect on Mental Status	Specific information for the mental health professional indicating pertinent drug effects which may affect or alter a patient's mental status.
Mental Health: Effect on Psychiatric Treatment	Specific information for the mental health professional relative to the impact on psychiatric treatment.

Mental Health: Child/Adolescent Considerations	Specific information for the mental health professional relative to clinical trials for children and adolescent patients.
Cardiovascular Considerations	This field provides a focused summary of some of the important issues concerning cardiovascular applications, outcomes, side effects, interactions, and recent developments relevant to the drug.
Anesthesia and Critical Care Concerns/Other Considerations	This field provides a focused summary of some of the important issues concerning anesthesia and critical care applications relevant to the drug; other additional information may be included.
Oncology: Bone Marrow Comments	Additional information relating to myelosuppressive toxicities anticipated with the drug.
Index Terms	Other names or accepted abbreviations of the generic drug.
References	Literature or source used in preparing the monograph.
International Brand Names	Trade names found throughout various international markets.

The following countries are included in the International Brand Names field and are abbreviated as follows:

Argentina (AR)

Australia (AU)

Austria (AT)

Belgium (BE)

Brazil (BR)

Bulgaria (BG)

Canada (CA)

Chile (CL)

China (CN)

Colombia (CO)

Costa Rica (CR)

FDA PREGNANCY CATEGORIES

Lexi-Drugs Online

Throughout this book there is a field labeled Pregnancy Risk Factor and the letter A, B, C, D, or X immediately following which signifies a category. The FDA has established these five categories to indicate the potential of a systemically absorbed drug for causing birth defects. The key differentiation among the categories rests upon the reliability of documentation and the risk:benefit ratio. Pregnancy Category X is particularly notable in that if any data exists that may implicate a drug as a teratogen and the risk:benefit ratio is clearly negative, the drug is contraindicated during pregnancy.

These categories are summarized as follows:

A	Controlled studies in pregnant women fail to demonstrate a risk to the fetus in the first trimester with no evidence of risk in later trimesters. The possibility of fetal harm appears remote.
B	Either animal-reproduction studies have not demonstrated a fetal risk but there are no controlled studies in pregnant women, or animal-reproduction studies have shown an adverse effect (other than a decrease in fertility) that was not confirmed in controlled studies in women in the first trimester and there is no evidence of a risk in later trimesters.
C	Either studies in animals have revealed adverse effects on the fetus (teratogenic or embryocidal effects or other) and there are no controlled studies in

	women, or studies in women and animals are not available. Drugs should be given only if the potential benefits justify the potential risk to the fetus.
D	There is positive evidence of human fetal risk, but the benefits from use in pregnant women may be acceptable despite the risk (eg, if the drug is needed in a life-threatening situation or for a serious disease for which safer drugs cannot be used or are ineffective).
X	Studies in animals or human beings have demonstrated fetal abnormalities or there is evidence of fetal risk based on human experience, or both, and the risk of the use of the drug in pregnant women clearly outweighs any possible benefit. The drug is contraindicated in women who are or may become pregnant.

SAFE WRITING

Lexi-Drugs Online

Health professionals and their support personnel frequently produce handwritten copies of information they see in print; therefore, such information is subjected to even greater possibilities for error or misinterpretation on the part of others. Thus, particular care must be given to how drug names and strengths are expressed when creating written healthcare documents.

The following are a few examples of safe writing rules suggested by the Institute for Safe Medication Practices, Inc.[1]

1. There should be a space between a number and its units as it is easier to read. There should be no periods after the abbreviations mg or mL.

Correct	Incorrect
10 mg	10mg
100 mg	100mg

2. Never place a decimal and a zero after a whole number (2 mg is correct and 2.0 mg is **incorrect**). If the decimal point is not seen because it falls on a line or because individuals are working from copies where the decimal point is not seen, this causes a tenfold overdose.
3. Just the opposite is true for numbers less than one. Always place a zero before a naked decimal (0.5 mL is correct, .5 mL is **incorrect**).
4. Never abbreviate the word unit. The handwritten U or u, looks like a 0 (zero), and may cause a tenfold overdose error to be made.
5. IU is not a safe abbreviation for international units. The handwritten IU looks like IV. Write out international units or use int. units.
6. Q.D. is not a safe abbreviation for once daily, as when the Q is followed by a sloppy dot, it looks like QID which means four times daily.
7. O.D. is not a safe abbreviation for once daily, as it is properly interpreted as meaning “right eye” and has caused liquid medications such as saturated solution of potassium iodide and Lugol's solution to be administered incorrectly. There is no safe abbreviation for once daily. It must be written out in full.
8. Do not use chemical names such as 6-mercaptopurine or 6-thioguanine, as sixfold overdoses have been given when these were not recognized as chemical names. The proper names of these drugs are mercaptopurine or thioguanine.
9. Do not abbreviate drug names (5FC, 6MP, 5-ASA, MTX, HCTZ, CPZ, PBZ, etc) as they are misinterpreted and cause error.
10. Do not use the apothecary system or symbols.
11. Do not abbreviate microgram as µg; instead use mcg as there is less likelihood of misinterpretation.
12. When writing an outpatient prescription, write a complete prescription. A complete prescription can prevent the prescriber, the pharmacist, and/or the patient from making a mistake and can eliminate the need for further clarification. The legible prescriptions should contain:
    a. patient's full name
    b. for pediatric or geriatric patients: their age (or weight where applicable)
    c. drug name, dosage form and strength; if a drug is new or rarely prescribed, print this information
    d. number or amount to be dispensed
    e. complete instructions for the patient, including the purpose of the medication
    f. when there are recognized contraindications for a prescribed drug, indicate to the pharmacist that you are aware of this fact (ie, when prescribing a potassium salt for a patient receiving an ACE inhibitor, write “K serum level being monitored”)

[1] From “Safe Writing” by Davis NM, PharmD and Cohen MR, MS, Lecturers and Consultants for Safe Medication Practices, 1143 Wright Drive, Huntington Valley, PA 19006. Phone: (215) 947-7566.

FDA NAME DIFFERENTIATION PROJECT: THE USE OF TALL-MAN LETTERS

Lexi-Drugs Online

Confusion between similar drug names is an important cause of medication errors. For years, The Institute For Safe Medication Practices (ISMP), has urged generic manufacturers to use a combination of large and small letters as well as bolding (ie, chlorpro**MAZINE** and chlorpro**PAMIDE**) to help distinguish drugs with look-alike names, especially when they share similar strengths. Recently the FDA's Division of Generic Drugs began to issue recommendation letters to manufacturers suggesting this novel way to label their products to help reduce this drug name confusion. Although this project has had marginal success, the method has successfully eliminated problems with products such as diphenhydr**AMINE** and dimenhy**DRINATE**. Hospitals should also follow suit by making similar changes in their own labels, preprinted order forms, computer screens and printouts, and drug storage location labels.

Lexi-Comp Medical Publishing will use “Tall-Man” letters for the drugs suggested by the FDA or recommended by ISMP.

The following is a list of generic product names and recommended revisions.

Drug Product	**Recommended Revision**
acetazolamide	aceta**ZOLAMIDE**
acetohexamide	aceto**HEXAMIDE**
alprazolam	**ALPRAZ**olam
amiloride	a**MIL**oride
amlodipine	am**LODIP**ine
azacitidine	aza**CITID**ine
azathioprine	aza**THIO**prine
bupropion	bu**PROP**ion
buspirone	bus**PIR**one
carbamazepine	car**BAM**azepine
carboplatin	**CARBO**platin
cefazolin	ce**FAZ**olin
ceftriaxone	cef**TRIAX**one
chlordiazepoxide	chlordiaze**POXIDE**
chlorpromazine	chlorpro**MAZINE**
chlorpropamide	chlorpro**PAMIDE**
cisplatin	**CIS**platin
clomiphene	clomi**PHENE**
clomipramine	clomi**PRAMINE**
clonazepam	clonaze**PAM**

clonidine	clo**NID**ine
cycloserine	cyclo**SERINE**
cyclosporine	cyclo**SPORINE**
dactinomycin	**DACTIN**omycin
daptomycin	**DAPTO**mycin
daunorubicin	**DAUNO**rubicin
dimenhydrinate	dimenhy**DRINATE**
diphenhydramine	diphenhydr**AMINE**
dobutamine	**DOBUT**amine
dopamine	**DOP**amine
doxorubicin	**DOXO**rubicin
duloxetine	**DUL**oxetine
ephedrine	e**PHED**rine
epinephrine	**EPINEPH**rine
fentanyl	fenta**NYL**
fluoxetine	**FLU**oxetine
glipizide	glipi**ZIDE**
glyburide	gly**BURIDE**
guaifenesin	guai**FEN**esin
guanfacine	guan**FACINE**
hydralazine	hydr**ALAZINE**
hydrocodone	**HYDRO**codone
hydromorphone	**HYDRO**morphone
hydroxyzine	hydr**OXY**zine
idarubicin	**IDA**rubicin
infliximab	in**FLIX**imab
lamivudine	lami**VUD**ine

lamotrigine	lamo**TRI**gine
lorazepam	**LOR**azepam
medroxyprogesterone	medroxy**PROGESTER**one
metformin	met**FORMIN**
methylprednisolone	methyl**PREDNIS**olone
methyltestosterone	methyl**TESTOSTER**one
metronidazole	metro**NIDAZOLE**
nicardipine	ni**CAR**dipine
nifedipine	**NIFE**dipine
nimodipine	ni**MOD**ipine
olanzapine	**OLANZ**apine
oxcarbazepine	**OX**carbazepine
oxycodone	oxy**CODONE**
paroxetine	**PAR**oxetine
pentobarbital	**PENT**obarbital
phenobarbital	**PHEN**obarbital
prednisolone	predniso**LONE**
prednisone	predni**SONE**
quetiapine	**QUE**tiapine
quinidine	qui**NID**ine
quinine	qui**NINE**
rituximab	ri**TUX**imab
sitagliptin	sita**GLIP**tin
sufentanil	**SUF**entanil
sulfadiazine	sulf**ADIAZINE**
sulfisoxazole	sulfi**SOXAZOLE**

sumatriptan	**SUMA**triptan
tiagabine	tia**GAB**ine
tizanidine	ti**ZAN**idine
tolazamide	**TOLAZ**amide
tolbutamide	**TOLBUT**amide
tramadol	tra**MAD**ol
trazodone	tra**ZOD**one
vinblastine	vin**BLAS**tine
vincristine	vin**CRIS**tine

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Abacavir and Abacavir-Containing Products: Boxed Warning Update Concerning Increased Risk of Hypersensitivity Reactions in Patients with *HLA-B*5701* Allele - July 2008

The Food and Drug Administration (FDA) is requesting the manufacturer of abacavir and abacavir-containing products to update the boxed warning concerning serious hypersensitivity reactions. The update includes a recommendation to test all patients for the presence of the *HLA-B*5701* allele prior to initiating therapy or resuming therapy in patients of unknown *HLA-B*5701* status, including patients previously tolerating therapy. Patients testing positive for the presence of this genotype are at an increased risk for serious hypersensitivity reactions. If a patient tests positive for the presence of the *HLA-B*5701* allele, abacavir is **not** recommended and an alternative agent should be selected. If a suspected abacavir hypersensitivity reaction occurs during therapy, regardless of *HLA-B*5701* status, abacavir should be discontinued immediately and permanently.

Additional information may be found at http://www.fda.gov/medwatch.safety/2008/safety08.htm#Abacavir

Abacavir-Containing Products: Increased Risk of Myocardial Infarction Observed; Health Canada Issues Alert to Canadian Healthcare Professionals - June 2008

The Canadian Dear Healthcare Provider letter can be found at http://www.hc-sc.gc.ca/dhp-mps/medeff/advisories-avis/prof/_2008/abacavir_hpc-cps-eng.php

FDA Early Communication: Increased Risk of Myocardial Infarction Observed - March 2008

The Food and Drug Administration (FDA) has issued an Early Communication to patients, caregivers, and healthcare professionals informing them of new evidence regarding the use of abacavir (Ziagen®) and didanosine (Videx®) and the risk of myocardial infarction (MI). Analysis from the Data Collection on Adverse Events of Anti-HIV Drugs (D:A:D) Study, an observational study aimed at investigating the adverse effects of certain nucleoside reverse transcriptase inhibitors (NRTI) involving over 33,000 patients, suggests that patients taking Ziagen® or Videx® appear to be at an increased risk for MI in comparison to other NRTIs. The risk of MI appears to be greatest with recent use (within 6 months) and in patients with existing risk factors for heart disease (eg, hypercholesterolemia, hypertension, diabetes, smoking, and age). In addition, the risk of MI appears to be reversible upon discontinuation of the offending agents. Patients taking abacavir (Ziagen®) may have up to a 90% increase in their risk of MI according to study results.

The FDA emphasizes that these are preliminary results of the D:A:D study and urges healthcare providers to weigh the potential risks and benefits of every treatment option until further results become available.

Additional information is available at http://www.fda.gov/cder/drug/early_comm/abacavir.htm

Pronunciation(a BAK a veer, la MI vyoo deen, & zye DOE vyoo deen)

U.S. Brand NamesTrizivir®

Pharmacologic CategoryAntiretroviral Agent, Reverse Transcriptase Inhibitor (Nucleoside)

Use: Labeled IndicationsTreatment of HIV infection (either alone or in combination with other antiretroviral agents) in patients whose regimen would otherwise contain the components of Trizivir®

Dosing: AdultsHIV treatment: Oral: 1 tablet twice daily. **Note:** Not recommended for patients <40 kg.

Dosing: ElderlyUse with caution.

Dosing: PediatricHIV treatment: Adolescents: Refer to adult dosing (not recommended for patients <40 kg).

Dosing: Renal ImpairmentCl_{cr} ≤50 mL/minute: Avoid use.

Dosing: Hepatic ImpairmentUse contraindicated.

Calculations

- Creatinine Clearance: Adults

Administration: OralAdminister without regard to food or water.

Dietary ConsiderationsMay be taken without regard to food or water.

StorageStore at room temperature 15°C to 30°C (59°F to 86°F).

RestrictionsAn FDA-approved medication guide and warning card (summarizing symptoms of hypersensitivity) must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to abacavir, lamivudine, zidovudine, or any component of the formulation; hepatic impairment. Do not rechallenge patients who have experienced hypersensitivity to abacavir.

Allergy Considerations

- Abacavir Allergy
- LamiVUDine Allergy
- Zidovudine Allergy

Warnings/Precautions

Boxed warnings:

- Chronic hepatitis B: See “Disease-related concerns” below.
- Hematologic toxicity: See “Concerns related to adverse effects” below.
- HIV: Appropriate use: See “Disease-related concerns” below.
- Hypersensitivity reactions: See “Concerns related to adverse effects” below.
- Lactic acidosis/hepatomegaly: See “Concerns related to adverse effects” below.
- Myopathy: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).
- Hematologic toxicity: **[U.S. Boxed Warning]: Zidovudine has been associated with hematologic toxicities (eg, neutropenia, anemia);** use with caution in patients with bone marrow compromise.
- Hypersensitivity reactions: **[U.S. Boxed Warning]: Fatal hypersensitivity reactions have occurred in patients taking abacavir (in Trizivir®).** Patients testing positive for the presence of the *HLA-B*5701* allele are at an increased risk for hypersensitivity reactions. Screening for *HLA-B*5701* allele status is recommended prior to initiating abacavir-containing therapy or reinitiating therapy in patients of unknown status, including patients who previously tolerated abacavir therapy. Trizivir® is **not** recommended in patients testing positive for the *HLA-B*5701* allele. Patients exhibiting symptoms of fever, skin rash, fatigue, respiratory symptoms (eg, pharyngitis, dyspnea, cough) and/or GI symptoms (eg, abdominal pain, nausea, vomiting, diarrhea) should discontinue therapy immediately and call for medical attention. Trizivir® should be permanently discontinued if hypersensitivity cannot be ruled out, even when other diagnoses are possible and regardless of *HLA-B*5701* status. Trizivir® SHOULD NOT be restarted because more severe symptoms may occur within hours, including LIFE-THREATENING HYPOTENSION AND DEATH. Fatal hypersensitivity reactions have occurred following the reintroduction of abacavir in patients whose therapy was interrupted (eg, interruption in drug supply, temporary discontinuation while treating other conditions). Reactions occurred within hours. In some cases, signs of hypersensitivity may have been previously present, but attributed to other medical conditions (eg, acute onset respiratory diseases, gastroenteritis, reactions to other medications). If Trizivir® is to be restarted following an interruption in therapy, first evaluate the patient for previously unsuspected symptoms of hypersensitivity. Do not restart if hypersensitivity is suspected or cannot be ruled out. To report these events on Trizivir® hypersensitivity, a registry has been established (1-800-270-0425).
- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.
- Lactic acidosis/hepatomegaly: **[U.S Boxed Warning]: Lactic acidosis and severe hepatomegaly with steatosis have been reported with nucleoside analogues, including fatal cases;** use with caution in patients with risk factors for liver disease (risk may be increased with female gender, obesity, pregnancy or prolonged exposure) and suspend treatment in any patient who develops clinical or laboratory findings suggestive of lactic acidosis or hepatotoxicity (transaminase elevation may/may not accompany hepatomegaly and steatosis).
- Myopathy: **[U.S. Boxed Warning]: Prolonged use of zidovudine has been associated with symptomatic myopathy and myositis.**

Disease-related concerns:

- Chronic hepatitis B: **[U.S. Boxed Warning]: Exacerbation of hepatitis B has been reported with discontinuation of lamivudine in coinfected HIV/HBV patients;** monitor hepatic function closely for several months after discontinuing Trizivir® in coinfected patients.
- Coronary heart disease: Use caution in patients with risks for coronary heart disease; modifiable risk factors (eg, hypertension, hyperlipidemia, diabetes mellitus, and smoking) should be minimized prior to use.
- HIV: Appropriate use: **[U.S. Boxed Warning]: This combination should only be used as part of a multidrug regimen for which the individual components are indicated.**
- Renal impairment: Trizivir®, as a fixed-dose combination tablet, should not be used in patients with Cl_{cr} ≤50 mL/minute.

Concurrent drug therapy issues:

- Interferon alfa: Use with caution in combination with interferon alfa with or without ribavirin in HIV/HBV coinfected patients; monitor closely for hepatic decompensation, anemia, or neutropenia; dose reduction or discontinuation of interferon and/or ribavirin may be required if toxicity evident.

Special populations:

- Adults <40 kg: Trizivir®, as a fixed-dose combination tablet, should not be used in patients <40 kg or those requiring dosage adjustment.

- Pediatrics: Trizivir®, as a fixed-dose combination tablet, should not be used in children.

Pregnancy Risk FactorC

Pregnancy ConsiderationsSee individual agents.

LactationSee individual agents.

Breast-Feeding ConsiderationsSee individual agents.

Adverse ReactionsFatal hypersensitivity reactions have occurred in patients taking abacavir (in Trizivir®). If Trizivir® is to be restarted following an interruption in therapy, first evaluate the patient for previously unsuspected symptoms of hypersensitivity. Do not restart if hypersensitivity is suspected or if hypersensitivity cannot be ruled out.

The following information is based on CNA3005 study data concerning effects noted in patients receiving abacavir, lamivudine, and zidovudine. See individual agents for additional information.

>10%:

Central nervous system: Headache (13%), malaise (12%), fatigue (12%)

Gastrointestinal: Nausea (19%)

1% to 10%:

Central nervous system: Fever/chills (6%), depression (6%), anxiety (5%)

Dermatologic: Rash (5%)

Endocrine & metabolic: Triglycerides increased (2% grade 3-4)

Gastrointestinal: Nausea and vomiting (10%), diarrhea (7%), amylase increased (2%)

Hematologic: Neutropenia (5%)

Hepatic: ALT increased (6%)

Neuromuscular & skeletal: CPK increased (7%)

Miscellaneous: Hypersensitivity (2% to 9% based on abacavir component), ear/nose/throat infection (5), viral infection (5%)

Other (frequency unknown): Pancreatitis, GGT increased, fat redistribution, immune reconstitution syndrome

Drug Interactions

Acyclovir-Valacyclovir: May enhance the CNS depressant effect of Zidovudine. *Risk C: Monitor therapy*

DOXOrubicin: May enhance the adverse/toxic effect of Zidovudine. DOXOrubicin may diminish the therapeutic effect of Zidovudine. *Risk D: Consider therapy modification*

DOXOrubicin (Liposomal): May enhance the adverse/toxic effect of Zidovudine. DOXOrubicin (Liposomal) may diminish the therapeutic effect of Zidovudine. *Risk D: Consider therapy modification*

Emtricitabine: LamiVUDine may enhance the adverse/toxic effect of Emtricitabine. *Risk X: Avoid combination*

Fluconazole: May decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Ganciclovir-Valganciclovir: May enhance the adverse/toxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Hematologic toxicity is of specific concern. *Risk D: Consider therapy modification*

Interferons: May enhance the adverse/toxic effect of Zidovudine. Interferons may decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Methadone: May increase the serum concentration of Zidovudine. *Risk C: Monitor therapy*

Probenecid: May decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the serum concentration of Zidovudine. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the serum concentration of Abacavir. *Risk C: Monitor therapy*

Ribavirin: May enhance the hepatotoxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Lactic acidosis may occur. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of Zidovudine. **Exceptions:** Rifabutin. *Risk D: Consider therapy modification*

Stavudine: Zidovudine may diminish the therapeutic effect of Stavudine. *Risk D: Consider therapy modification*

Trimethoprim: May decrease the excretion of LamiVUDine. *Risk C: Monitor therapy*

Valproic Acid: May decrease the metabolism of Zidovudine. *Risk C: Monitor therapy*

Zalcitabine: LamiVUDine may diminish the therapeutic effect of Zalcitabine. *Risk D: Consider therapy modification*

Monitoring ParametersCBC with differential, serum creatine kinase, CD4 count, HIV RNA plasma levels, bilirubin, serum transaminases, triglycerides, serum amylase; *HLA-B*5701* genotype status prior to initiation of therapy and prior to reinitiation of therapy in patients of unknown *HLA-B*5701* status; signs and symptoms of hypersensitivity, particularly in patients untested for the *HLA-B*5701* allele; signs and symptoms of pancreatitis; observe for appearance of opportunistic infections

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsCBC with differential, serum creatine kinase, CD4 count, HIV RNA plasma levels, bilirubin, serum transaminases, triglycerides, serum amylase; *HLA-B*5701* genotype status prior to initiation of therapy and prior to reinitiation of therapy in patients of unknown *HLA-B*5701* status

Patient EducationSee individual agents.

Pricing: U.S. (www.drugstore.com)

Tablets (Trizivir)

300-150-300 mg (60): $1271.45

Mechanism of ActionThe combination of abacavir, lamivudine, and zidovudine is believed to act synergistically to inhibit reverse transcriptase via DNA chain termination after incorporation of the nucleoside analogue as well as to delay the emergence of mutations conferring resistance.

Pharmacodynamics/KineticsBioavailability studies of Trizivir® show no difference in AUC or C_{max} when compared to abacavir, lamivudine, and zidovudine given together as individual agents. See individual agents.

Related Information

- Abacavir
- Antiretroviral Agents
- Antiretroviral Therapy for HIV Infection: Adults and Adolescents
- LamiVUDine
- Management of Healthcare Worker Exposures to HBV, HCV, and HIV
- Zidovudine

Pharmacotherapy PearlsHypersensitivity testing (*HLA-B*5701*): Prevalence of hypersensitivity reactions has been estimated at 5% to 8% in Caucasians and 2% to 3% in African-Americans. Pretherapy identification of *HLA-B*5701*-positive patients, and subsequent avoidance of abacavir therapy in these patients has been shown to reduce the occurrence of abacavir-mediated hypersensitivity reactions. A skin patch test is in development for clinical screening purposes; however, only PCR-mediated genotyping methods are currently in clinical practice use for documentation of this susceptibility marker.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause insomnia

Mental Health: Effects on Psychiatric TreatmentGastrointestinal side effects are common; these effects may be additive with concurrent use of SSRIs, lithium, or valproate. The hypnotic effect of the benzodiazepines may be diminished. Valproic acid may decrease the clearance of zidovudine. Increase in triglycerides is common and may be additive with clozapine, olanzapine, or quetiapine. May cause pancreatitis; use caution with valproic acid and atypical antipsychotics. May increase GGT; use caution with olanzapine and valproic acid. May cause aplastic anemia; use caution with clozapine and carbamazepine. Suspected Stevens-Johnson syndrome (SJS) has been reported in patients receiving abacavir in combination with medications known to be associated with SJS (lamotrigine).

Index Terms3TC, Abacavir, and Zidovudine; Azidothymidine, Abacavir, and Lamivudine; AZT, Abacavir, and Lamivudine; Compound S, Abacavir, and Lamivudine; Lamivudine, Abacavir, and Zidovudine; ZDV, Abacavir, and Lamivudine; Zidovudine, Abacavir, and Lamivudine

Special Alerts

Abacavir and Abacavir-Containing Products: Boxed Warning Update Concerning Increased Risk of Hypersensitivity Reactions in Patients with *HLA-B*5701* Allele - July 2008

The Food and Drug Administration (FDA) is requesting the manufacturer of abacavir and abacavir-containing products to update the boxed warning concerning serious hypersensitivity reactions. The update includes a recommendation to test all patients for the presence of the *HLA-B*5701* allele prior to initiating therapy or resuming therapy in patients of unknown *HLA-B*5701* status, including patients previously tolerating therapy. Patients testing positive for the presence of this genotype are at an increased risk for serious hypersensitivity reactions. If a patient tests positive for the presence of the *HLA-B*5701* allele, abacavir is **not** recommended and an alternative agent should be selected. If a suspected abacavir hypersensitivity reaction occurs during therapy, regardless of *HLA-B*5701* status, abacavir should be discontinued immediately and permanently.

Abacavir-Containing Products: Increased Risk of Myocardial Infarction Observed; Health Canada Issues Alert to Canadian Healthcare Professionals - June 2008

The Canadian Dear Healthcare Provider letter can be found at http://www.hc-sc.gc.ca/dhp-mps/medeff/advisories-avis/prof/_2008/abacavir_hpc-cps-eng.php

FDA Early Communication: Increased Risk of Myocardial Infarction Observed - March 2008

The Food and Drug Administration (FDA) has issued an Early Communication to patients, caregivers, and healthcare professionals informing them of new evidence regarding the use of abacavir (Ziagen®) and didanosine (Videx®) and the risk of myocardial infarction (MI). Analysis from the Data Collection on Adverse Events of Anti-HIV Drugs (D:A:D) Study, an observational study aimed at investigating the adverse effects of certain nucleoside reverse transcriptase inhibitors (NRTI) involving over 33,000 patients, suggests that patients taking Ziagen® or Videx® appear to be at an increased risk for MI in comparison to other NRTIs. The risk of MI appears to be greatest with recent use (within 6 months) and in patients with existing risk factors for heart disease (eg, hypercholesterolemia, hypertension, diabetes, smoking, and age). In addition, the risk of MI appears to be reversible upon discontinuation of the offending agents. Patients taking abacavir (Ziagen®) may have up to a 90% increase in their risk of MI according to study results.

The FDA emphasizes that these are preliminary results of the D:A:D study and urges healthcare providers to weigh the potential risks and benefits of every treatment option until further results become available.

Additional information is available at http://www.fda.gov/cder/drug/early_comm/abacavir.htm

Pronunciation(a BAK a veer & la MI vyoo deen)

U.S. Brand NamesEpzicom®

Canadian Brand NamesKivexa™

Pharmacologic CategoryAntiretroviral Agent, Reverse Transcriptase Inhibitor (Nucleoside)

Use: Labeled IndicationsTreatment of HIV infections in combination with other antiretroviral agents

Dosing: AdultsHIV: Oral: One tablet (abacavir 600 mg and lamivudine 300 mg) once daily

Dosing: Renal ImpairmentCl_{cr} <50 mL/minute: Use not recommended

Dosing: Hepatic ImpairmentUse contraindicated.

Calculations

- Creatinine Clearance: Adults

Administration: OralMay be administered with or without food.

Dietary ConsiderationsMay be taken with or without food.

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F).

RestrictionsAn FDA-approved medication guide and warning card (summarizing symptoms of hypersensitivity) must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to abacavir, lamivudine, or any component of the formulation; hepatic impairment. Do not rechallenge patients who have experienced hypersensitivity to abacavir.

Allergy Considerations

- Abacavir Allergy
- LamiVUDine Allergy

Warnings/Precautions

Boxed warnings:

- Chronic hepatitis B: See “Disease-related concerns” below.
- HIV: Appropriate use: See “Disease-related concerns” below.
- Hypersensitivity reactions: See “Concerns related to adverse effects” below.
- Lactic acidosis/hepatomegaly: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).
- Hypersensitivity reactions: **[U.S. Boxed Warning]: Fatal hypersensitivity reactions have occurred in patients taking abacavir (in Epzicom®).** Patients testing positive for the presence of the *HLA-B*5701* allele are at an increased risk for hypersensitivity reactions. Screening for *HLA-B*5701* allele status is recommended prior to initiating abacavir-containing therapy or reinitiating therapy in patients of unknown status, including patients who previously tolerated abacavir therapy. Epzicom® is **not** recommended in patients testing positive for the *HLA-B*5701* allele. Patients exhibiting symptoms of fever, skin rash, fatigue, respiratory symptoms (eg, pharyngitis, dyspnea, cough) and/or GI symptoms (eg, abdominal pain, nausea, vomiting, diarrhea) should discontinue therapy immediately and call for medical attention. Epzicom® should be permanently discontinued if hypersensitivity cannot be ruled out, even when other diagnoses are possible and regardless of *HLA-B*5701* status. Epzicom® SHOULD NOT be restarted because more severe symptoms may occur within hours, including LIFE-THREATENING HYPOTENSION AND DEATH. Fatal hypersensitivity reactions have occurred following the reintroduction of abacavir in patients whose therapy was interrupted (eg, interruption in drug supply, temporary discontinuation while treating other conditions). Reactions occurred within hours. In some cases, signs of hypersensitivity may have been previously present, but attributed to other medical conditions (eg, acute onset respiratory diseases, gastroenteritis, reactions to other medications). If Epzicom® is to be restarted following an interruption in therapy, first evaluate the patient for previously unsuspected symptoms of hypersensitivity. Do not restart if hypersensitivity is suspected or cannot be ruled out. To report these events on Epzicom® hypersensitivity, a registry has been established (1-800-270-0425).
- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.
- Lactic acidosis/hepatomegaly: **[U.S Boxed Warning]: Lactic acidosis and severe hepatomegaly with steatosis have been reported with nucleoside analogues, including fatal cases;** use with caution in patients with risk factors for liver disease (risk may be increased with female gender, obesity, pregnancy or prolonged exposure) and suspend treatment in any patient who develops clinical or laboratory findings suggestive of lactic acidosis or hepatotoxicity (transaminase elevation may/may not accompany hepatomegaly and steatosis).

Disease-related concerns:

- Coronary heart disease: Use caution in patients with risks for coronary heart disease; modifiable risk factors (eg, hypertension, hyperlipidemia, diabetes mellitus, and smoking) should be minimized prior to use.
- Chronic hepatitis B: **[U.S. Boxed Warning]: Following discontinuation of lamivudine, severe acute exacerbations of hepatitis B in patients coinfected with HBV and HIV have been reported.** Monitor patients closely for several months following discontinuation of therapy for chronic hepatitis B; clinical exacerbations may occur.
- HIV: Appropriate use: **[U.S. Boxed Warning]: This combination should only be used as part of a multidrug regimen for which the individual components are indicated.**
- Renal impairment: Due to fixed dose of combination product, use is not recommended with renal impairment (Cl_{cr} <50 mL/minute).

Concurrent drug therapy issues:

- Interferon alfa: Use with caution in combination with interferon alfa with or without ribavirin in HIV/HBV coinfected patients; monitor closely for hepatic decompensation, anemia, or neutropenia; dose reduction or discontinuation of interferon and/or ribavirin may be required if toxicity evident.

Special populations:

- Pediatrics: Due to fixed dose of combination product, use is not recommended in children.

Pregnancy Risk FactorC

Pregnancy ConsiderationsSee individual agents.

LactationSee individual agents.

Breast-Feeding ConsiderationsHIV-infected mothers are discouraged from breast-feeding to decrease potential transmission of HIV. See individual agents.

Adverse ReactionsSee individual agents.

Postmarketing and/or case reports: Alopecia, anaphylaxis, anemia, aplastic anemia, breath sounds abnormal, CPK increased, erythema multiforme, fat redistribution, hepatic steatosis, hepatitis B exacerbation, hyperglycemia, hypersensitivity reaction, lactic acidosis, lymphadenopathy, muscle weakness, pancreatitis, paresthesia, peripheral neuropathy, rhabdomyolysis, seizure, splenomegaly, Stevens-Johnson syndrome, stomatitis, urticaria, weakness, wheezing

Drug Interactions

Emtricitabine: LamiVUDine may enhance the adverse/toxic effect of Emtricitabine. *Risk X: Avoid combination*

Ganciclovir-Valganciclovir: May enhance the adverse/toxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Hematologic toxicity is of specific concern. *Risk D: Consider therapy modification*

Protease Inhibitors: May decrease the serum concentration of Abacavir. *Risk C: Monitor therapy*

Ribavirin: May enhance the hepatotoxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Lactic acidosis may occur. *Risk D: Consider therapy modification*

Trimethoprim: May decrease the excretion of LamiVUDine. *Risk C: Monitor therapy*

Zalcitabine: LamiVUDine may diminish the therapeutic effect of Zalcitabine. *Risk D: Consider therapy modification*

Monitoring ParametersAmylase, bilirubin, liver enzymes, hematologic parameters, viral load, and CD4 count; *HLA-B*5701* genotype status prior to initiation of therapy and prior to reinitiation of therapy in patients of unknown *HLA-B*5701* status; signs and symptoms of hypersensitivity, particularly in patients untested for the *HLA-B*5701* allele

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsAmylase, bilirubin, liver enzymes, hematologic parameters, viral load, and CD4 count,*HLA-B*5701* genotype status prior to initiation of therapy and prior to reinitiation of therapy in patients of unknown *HLA-B*5701* status

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Epzicom®: Abacavir 600 mg and lamivudine 300 mg

Generic AvailableNo

ManufacturerGlaxoSmithKline

Pricing: U.S. (www.drugstore.com)

Tablets (Epzicom)

600-300 mg (30): $870.93

Mechanism of ActionNucleoside reverse transcriptase inhibitor combination.

Abacavir is a guanosine analogue which is phosphorylated to carbovir triphosphate which interferes with HIV viral RNA-dependent DNA polymerase resulting in inhibition of viral replication.

Lamivudine is a cytosine analog. After lamivudine is triphosphorylated, the principle mode of action is inhibition of HIV reverse transcription via viral DNA chain termination; inhibits RNA-dependent DNA polymerase activities of reverse transcriptase.

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Abacavir
- Antiretroviral Agents
- Antiretroviral Therapy for HIV Infection: Adults and Adolescents
- LamiVUDine
- Management of Healthcare Worker Exposures to HBV, HCV, and HIV

Pharmacotherapy PearlsA high rate of early virologic nonresponse was observed when abacavir, lamivudine, and tenofovir were used as the initial regimen in treatment-naive patients. Use of this combination is not recommended; patients currently on this regimen should be closely monitored for modification of therapy.

Hypersensitivity testing (*HLA-B*5701*): Prevalence of hypersensitivity reactions has been estimated at 5% to 8% in Caucasians and 2% to 3% in African-Americans. Pretherapy identification of *HLA-B*5701*-positive patients, and subsequent avoidance of abacavir therapy in these patients has been shown to reduce the occurrence of abacavir-mediated hypersensitivity reactions. A skin patch test is in development for clinical screening purposes; however, only PCR-mediated genotyping methods are currently in clinical practice use for documentation of this susceptibility marker.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause anxiety, abnormal dreams, dizziness, depression, fatigue, lethargy, malaise, insomnia, and headache

Mental Health: Effects on Psychiatric TreatmentSide effects mimic depressive symptoms; use caution with benzodiazepines, CNS depressants, or antidepressants. May rarely cause neutropenia; use caution with clozapine and carbamazepine.

Index TermsAbacavir Sulfate and Lamivudine; Lamivudine and Abacavir

Abacavir-Containing Products: Increased Risk of Myocardial Infarction Observed; Health Canada Issues Alert to Canadian Healthcare Professionals - June 2008

The Canadian Dear Healthcare Provider letter can be found at http://www.hc-sc.gc.ca/dhp-mps/medeff/advisories-avis/prof/_2008/abacavir_hpc-cps-eng.php

FDA Early Communication: Increased Risk of Myocardial Infarction Observed - March 2008

The Food and Drug Administration (FDA) has issued an Early Communication to patients, caregivers, and healthcare professionals informing them of new evidence regarding the use of abacavir (Ziagen®) and didanosine (Videx®) and the risk of myocardial infarction (MI). Analysis from the Data Collection on Adverse Events of Anti-HIV Drugs (D:A:D) Study, an observational study aimed at investigating the adverse effects of certain nucleoside reverse transcriptase inhibitors (NRTI) involving over 33,000 patients, suggests that patients taking Ziagen® or Videx® appear to be at an increased risk for MI in comparison to other NRTIs. The risk of MI appears to be greatest with recent use (within 6 months) and in patients with existing risk factors for heart disease (eg, hypercholesterolemia, hypertension, diabetes, smoking, and age). In addition, the risk of MI appears to be reversible upon discontinuation of the offending agents. Patients taking abacavir (Ziagen®) may have up to a 90% increase in their risk of MI according to study results.

The FDA emphasizes that these are preliminary results of the D:A:D study and urges healthcare providers to weigh the potential risks and benefits of every treatment option until further results become available.

Additional information is available at http://www.fda.gov/cder/drug/early_comm/abacavir.htm

Pronunciation(a BAK a veer)

U.S. Brand NamesZiagen®

Canadian Brand NamesZiagen®

Pharmacologic CategoryAntiretroviral Agent, Reverse Transcriptase Inhibitor (Nucleoside)

Use: Labeled IndicationsTreatment of HIV infections in combination with other antiretroviral agents

Dosing: AdultsHIV treatment: Oral: 300 mg twice daily or 600 mg once daily in combination with other antiretroviral agents

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricHIV treatment: Oral: 3 months to 16 years: 8 mg/kg body weight twice daily (maximum: 300 mg twice daily) in combination with other antiretroviral agents

Dosing: Hepatic Impairment

Mild dysfunction (Child-Pugh score 5-6): 200 mg twice daily (oral solution is recommended)

Moderate-to-severe dysfunction: Use is contraindicated by the manufacturer

Administration: OralMay be administered with or without food.

Dietary ConsiderationsMay be taken with or without food.

StorageStore oral solution and tablets at controlled room temperature of 20°C to 25°C (68°F to 77°F). Oral solution may be refrigerated; do not freeze.

RestrictionsAn FDA-approved medication guide and warning card (summarizing symptoms of hypersensitivity) must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to abacavir or any component of the formulation (do not rechallenge patients who have experienced hypersensitivity to abacavir); moderate-to-severe hepatic impairment

Allergy Considerations

- Abacavir Allergy

Warnings/Precautions

Boxed warnings:

- Hypersensitivity reactions: See "Concerns related to adverse effects" below.
- Lactic acidosis/hepatomegaly: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).
- Hypersensitivity reactions: **[U.S. Boxed Warning]: Serious and sometimes fatal hypersensitivity reactions have occurred.** Patients testing positive for the presence of the *HLA-B*5701* allele are at an increased risk for hypersensitivity reactions. Screening for *HLA-B*5701* allele status is recommended prior to initiating therapy or reinitiating therapy in patients of unknown status, including patients who previously tolerated therapy. Therapy is **not** recommended in patients testing positive for the *HLA-B*5701* allele. Patients exhibiting symptoms from two or more of the following: Fever, skin rash, constitutional symptoms (malaise, fatigue, aches), respiratory symptoms (eg, pharyngitis, dyspnea, cough), and GI symptoms (eg, abdominal pain, diarrhea, nausea, vomiting) should discontinue therapy immediately and call for medical attention. Abacavir should be permanently discontinued if hypersensitivity cannot be ruled out, even when other diagnoses are possible and regardless of *HLA-B*5701* status. Abacavir SHOULD NOT be restarted because more severe symptoms may occur within hours, including LIFE-THREATENING HYPOTENSION AND DEATH. Fatal hypersensitivity reactions have occurred following the reintroduction of abacavir in patients whose therapy was interrupted (ie, interruption in drug supply, temporary discontinuation while treating other conditions). Reactions occurred within hours. In some cases, signs of hypersensitivity may have been previously present, but attributed to other medical conditions (eg, acute onset respiratory diseases, gastroenteritis, reactions to other medications). If abacavir is restarted following an interruption in therapy, evaluate the patient for previously unsuspected symptoms of hypersensitivity. Do not restart if hypersensitivity is suspected or if hypersensitivity cannot be ruled out. To report these events on abacavir hypersensitivity, a registry has been established (1-800-270-0425).
- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.
- Lactic acidosis/hepatomegaly: **[U.S Boxed Warning]: Lactic acidosis and severe hepatomegaly with steatosis have been reported with nucleoside analogues, including fatal cases;** use with caution in patients with risk factors for liver disease (risk may be increased with female gender, obesity, pregnancy or prolonged exposure) and suspend treatment in any patient who develops clinical or laboratory findings suggestive of lactic acidosis or hepatotoxicity (transaminase elevation may/may not accompany hepatomegaly and steatosis).

Disease-related concerns:

- Coronary heart disease: Use caution in patients with risks for coronary heart disease; modifiable risk factors (eg, hypertension, hyperlipidemia, diabetes mellitus, and smoking) should be minimized prior to use.
- Hepatic impairment: Use with caution in patients with mild hepatic dysfunction (contraindicated in moderate-to-severe dysfunction).
- HIV: Appropriate use: Abacavir should always be used as a component of a multidrug regimen.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <3 months of age.

Pregnancy Risk FactorC

Pregnancy ConsiderationsIt is not known if abacavir crosses the human placenta. No increased risk of overall birth defects has been observed following 1st trimester exposure according to data collected by the antiretroviral pregnancy registry. Cases of lactic acidosis/hepatic steatosis syndrome have been reported in pregnant women receiving nucleoside analogues. It is not known if pregnancy itself potentiates this known side effect; however, pregnant women may be at increased risk of lactic acidosis and liver damage. Hepatic enzymes and electrolytes should be monitored frequently during the 3rd trimester of pregnancy in women receiving nucleoside analogues. Dose adjustment is not needed for pregnancy. The Perinatal HIV Guidelines Working Group considers abacavir to be an alternative NRTI in dual nucleoside combination regimens. Health professionals are encouraged to contact the antiretroviral pregnancy registry to monitor outcomes of pregnant women exposed to antiretroviral medications (1-800-258-4263 or www.APRegistry.com).

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsHIV-infected mothers are discouraged from breast-feeding to decrease potential transmission of HIV.

Adverse ReactionsHypersensitivity reactions (which may be fatal) occur in ~5% of patients (see Warnings/Precautions). Symptoms may include anaphylaxis, fever, rash (including erythema multiforme), fatigue, diarrhea, abdominal pain; respiratory symptoms (eg, pharyngitis, dyspnea, cough, adult respiratory distress syndrome, or respiratory failure); headache, malaise, lethargy, myalgia, myolysis, arthralgia, edema, paresthesia, nausea and vomiting, mouth ulcerations, conjunctivitis, lymphadenopathy, hepatic failure, and renal failure.

Note: Rates of adverse reactions were defined during combination therapy with other antiretrovirals (lamivudine and efavirenz **or** lamivudine and zidovudine). Only reactions which occurred at a higher frequency in adults (except where noted) than in the comparator group are noted.

Adverse reaction rates attributable to abacavir alone are not available.

>10%:

- Central nervous system: Headache (7% to 13%)
- Gastrointestinal: Nausea (7% to 19%, children 9%)

1% to 10%:

- Central nervous system: Depression (6%), fever/chills (6%, children 9%), anxiety (5%)
- Dermatologic: Rash (5% to 6%, children 7%)
- Endocrine & metabolic: Triglycerides increased (2% to 6%)
- Gastrointestinal: Diarrhea (7%), vomiting (children 9%), amylase increased (2%)
- Hematologic: Thrombocytopenia (1%)
- Hepatic: AST increased (6%)
- Neuromuscular & skeletal: Musculoskeletal pain (5% to 6%)
- Miscellaneous: Hypersensitivity reactions (2% to 9%; may include reactions to other components of antiretroviral regimen), infection (EENT 5%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Erythema multiforme, fat redistribution, GGT increased, hepatic steatosis, hepatomegaly, hepatotoxicity, lactic acidosis, MI, pancreatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis

Drug Interactions

Ganciclovir-Valganciclovir: May enhance the adverse/toxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Hematologic toxicity is of specific concern. *Risk D: Consider therapy modification*

Protease Inhibitors: May decrease the serum concentration of Abacavir. *Risk C: Monitor therapy*

Ribavirin: May enhance the hepatotoxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Lactic acidosis may occur. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Ethanol may increase the risk of toxicity.

Monitoring ParametersCBC with differential, serum creatine kinase, CD4 count, HIV RNA plasma levels, serum transaminases, triglycerides, serum amylase; *HLA-B*5701* genotype status prior to initiation of therapy and prior to reinitiation of therapy in patients of unknown *HLA-B*5701* status; signs and symptoms of hypersensitivity, particularly in patients untested for the *HLA-B*5701* allele

Nursing: Physical Assessment/MonitoringAssess closely for any previous exposure/allergy to abacavir and evaluate risk factors for heart disease prior to beginning treatment. Assess other pharmacological or herbal products patient may be taking for potential interactions or toxicity; dosing adjustments may be necessary. A list of medications that should not be used is available in each bottle and patients should be provided with this information. **Note:** Patient must be closely monitored for any sign of hypersensitivity reaction which can occur within hours or at any time and may be fatal (can occur also at reintroduction with patients who have no history of previous reaction) (See Warnings/Precautions). Assess results of laboratory tests and effectiveness of therapy (decrease in infections and progress of disease; viral load and CD4 count) periodically during therapy. Teach patient proper use (eg, timing of multiple medications and drugs that should not be used concurrently), possible side effects/appropriate interventions, and importance of immediately reporting any sign of hypersensitivity or myocardial infarction.

Monitoring: Lab TestsCBC with differential, serum creatine kinase, CD4 count, HIV RNA plasma levels, serum transaminases, triglycerides, serum amylase; *HLA-B*5701* genotype status prior to initiation of therapy and prior to reinitiation of therapy in patients of unknown *HLA-B*5701* status

Patient EducationYou will be provided with a medication guide (identifying medications that should not be used during therapy) and a warning card (summarizing symptoms of hypersensitivity). Do not take any new prescriptions, over-the-counter medications, or herbal products (even if they are not on the list) without consulting prescriber. This drug will not cure HIV, nor has it been found to reduce transmission of HIV; use appropriate precautions to prevent spread to other persons. This drug is prescribed as one part of a multidrug combination; take exactly as directed for full course of therapy. Maintain adequate hydration (2-3 L/day of fluids) unless advised by prescriber to restrict fluids. Avoid alcohol to decrease risk of hypersensitivity reaction. You may be susceptible to infection; avoid crowds and exposure to known infections and do not have any vaccinations without consulting prescriber. Frequent blood tests may be required with prolonged therapy. May cause dizziness or weakness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea and vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). **Note:** Seek immediate emergency care if you experience unusual chest pain, palpitations, erratic heart beat or if you suspect you are having a heart attack. Stop drug and report immediately symptoms of hypersensitivity (eg, fever; rash; fatigue, malaise, lethargy; persistent nausea, vomiting, diarrhea, abdominal pain; mouth sores; sore throat, cough, difficulty breathing; headache; swelling of face, mouth or throat; numbness or loss of sensation; pain, tingling, or numbness in toes, feet, muscles or joints; swollen glands; alterations in urinary pattern; swelling of extremities or weight gain). Do not restart without specific instruction by your prescriber. If you are instructed to stop the medication, do not restart in the future. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, oral:

- Ziagen®: 20 mg/mL (240 mL) [strawberry-banana flavor]

Tablet:

- Ziagen®: 300 mg

Generic AvailableNo

ManufacturerGlaxoSmithKline

Pricing: U.S. (www.drugstore.com)

Solution (Ziagen)

20 mg/mL (240): $125.04

Tablets (Ziagen)

300 mg (60): $514.18

Mechanism of ActionNucleoside reverse transcriptase inhibitor. Abacavir is a guanosine analogue which is phosphorylated to carbovir triphosphate which interferes with HIV viral RNA-dependent DNA polymerase resulting in inhibition of viral replication.

Pharmacodynamics/Kinetics

Absorption: Rapid and extensive absorption

Distribution: V_d: 0.86 L/kg

Protein binding: 50%

Metabolism: Hepatic via alcohol dehydrogenase and glucuronyl transferase to inactive carboxylate and glucuronide metabolites

Bioavailability: 83%

Half-life elimination: 1.5 hours

Time to peak: 0.7-1.7 hours

Excretion: Primarily urine (as metabolites, 1.2% as unchanged drug); feces (16% total dose)

Related Information

- Antiretroviral Agents
- Antiretroviral Therapy for HIV Infection: Adults and Adolescents
- Management of Healthcare Worker Exposures to HBV, HCV, and HIV

Pharmacotherapy PearlsA high rate of early virologic nonresponse was observed when abacavir, lamivudine, and tenofovir were used as the initial regimen in treatment-naive patients. Use of this combination is not recommended; patients currently on this regimen should be closely monitored for modification of therapy.

Hypersensitivity testing (*HLA-B*5701*): Prevalence of hypersensitivity reactions has been estimated at 5% to 8% in Caucasians and 2% to 3% in African-Americans. Pretherapy identification of *HLA-B*5701*-positive patients, and subsequent avoidance of abacavir therapy in these patients has been shown to reduce the occurrence of abacavir-mediated hypersensitivity reactions. A skin patch test is in development for clinical screening purposes; however, only PCR-mediated genotyping methods are currently in clinical practice use for documentation of this susceptibility marker.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause fatigue, lethargy, malaise, insomnia, and headache

Mental Health: Effects on Psychiatric TreatmentSide effects mimic depressive symptoms; caution with benzodiazepines or other CNS depressants and antidepressants

Index TermsAbacavir Sulfate; ABC

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Orencia® may be confused with Oracea™

Pronunciation(ab a TA sept)

U.S. Brand NamesOrencia®

Canadian Brand NamesOrencia®

Pharmacologic CategoryAntirheumatic, Disease Modifying

Use: Labeled Indications

Treatment of moderately- to severely-active adult rheumatoid arthritis (RA); may be used as monotherapy or in combination with other DMARDs

Treatment of moderately- to severely-active juvenile idiopathic arthritis (JIA); may be used as monotherapy or in combination with methotrexate

Note: Abatacept should **not** be used in combination with anakinra or TNF-blocking agents

Dosing: Adults **Rheumatoid arthritis:** I.V.: Dosing is according to body weight. Repeat dose at 2 weeks and 4 weeks after initial dose, and every 4 weeks thereafter:

<60 kg: 500 mg

60-100 kg: 750 mg

>100 kg: 1000 mg

Dosing: ElderlyRefer to adult dosing. Due to potential for higher rates of infections and malignancies, use caution.

Dosing: Pediatric**JIA:** I.V.:

Children ≥6 years and <75 kg: 10 mg/kg, repeat dose at 2 and 4 weeks after initial infusion, and every 4 weeks thereafter; Maximum dose: 1000 mg

Children ≥6 years and >75 kg: **Note:** Dosage is according to body weight. Repeat dose at 2 weeks and 4 weeks after initial dose and every 4 weeks thereafter:

75-100 kg: 750 mg

>100 kg: 1000 mg

Dosing: Adjustment for ToxicityWithhold therapy for patients with serious infections.

Administration: I.V.Infuse over 30 minutes. Administer through a 0.2-1.2 micron low protein-binding filter

Administration: I.V. DetailpH: 7-8

StoragePrior to reconstitution, store at 2°C to 8°C (36°F to 46°F); protect from light. After dilution, may be stored for up to 24 hours at room temperature or refrigerated at 2°C to 8°C (36°F to 46°F). Must be used within 24 hours of reconstitution.

ReconstitutionReconstitute each vial with 10 mL SWFI using the provided silicone-free disposable syringe (discard solutions accidentally reconstituted with siliconized syringe as they may develop translucent particles). Inject SWFI down the side of the vial to avoid foaming. The reconstituted solution contains 25 mg/mL abatacept. Further dilute (using a silicone-free syringe) in 100 mL NS to a final concentration of ≤10 mg/mL. Prior to adding abatacept to the 100 mL bag, the manufacturer recommends withdrawing a volume of NS equal to the abatacept volume required, resulting in a final volume of 100 mL. Mix gently; do not shake.

CompatibilityStable in NS.

ContraindicationsThere are no contraindications listed within the FDA-approved labeling.

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Rare cases of hypersensitivity, anaphylaxis, or anaphylactoid reactions have been reported; medication for the treatment of hypersensitivity reactions should be available for immediate use.
- Infections: Caution should be exercised when considering the use in patients with a history of new/recurrent infections, with conditions that predispose them to infections, or with chronic, latent, or localized infections. Patients who develop a new infection while undergoing treatment should be monitored closely. If a patient develops a serious infection, therapy should be discontinued.
- Malignancy: Use may affect defenses against malignancies (via T cell inhibition); impact on the development and course of malignancies is not fully defined. As compared to the general population, an increased risk of lymphoma and lung cancer has been

noted in clinical trials; however, rheumatoid arthritis has been previously associated with an increased rate of lymphoma.

Disease-related concerns:

- COPD: Use caution with chronic obstructive pulmonary disease (COPD), higher incidences of adverse effects (COPD exacerbation, cough, rhonchi, dyspnea) have been observed; monitor closely.

Concurrent drug therapy issues:

- Anakinra: The manufacturer does not recommend concurrent use with anakinra.

- TNF-blocking agents: Adult patients receiving therapy in combination with TNF-blocking agents had higher rates of infections (including serious infections) than patients on TNF-blocking agents alone. Concurrent use with TNF-blocking agents is not recommended. Monitor for signs and symptoms of infection when transitioning from TNF-blocking agents to abatacept.

Special populations:

- Elderly: Use with caution, higher incidences of infection and malignancy were observed in the elderly.

- Pediatrics: Not FDA approved for use in children <6 years of age.

- Tuberculosis-positive patients: Safety has not been established in tuberculosis-positive patients; screen patients for latent tuberculosis infection prior to initiating therapy. Treat patients testing positive according to standard therapy prior to initiating abatacept.

Dosage form specific issues:

- Maltose: May contain maltose, which may result in falsely-elevated serum glucose readings on the day of infusion.

Other warnings/precautions:

- Hepatitis screening: Patients should be screened for viral hepatitis prior to use; antirheumatic therapy may cause reactivation of hepatitis B.

- Immunizations: Patients should be brought up to date with all immunizations before initiating therapy. Live vaccines should not be given concurrently or within 3 months of discontinuation of therapy; there is no data available concerning secondary transmission of live vaccines in patients receiving therapy.

Geriatric ConsiderationsThe number of elderly (≥65 years of age) were insufficient to draw significant clinical conclusions. The studies to date have not demonstrated any differences in safety and efficacy between young adults and elderly. However, the frequency of infections and malignancy was higher in those >65 years of age than those <65 years. Since elderly experience a higher incidence of infections and malignancies, use abatacept with caution in this population.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Due to the potential risk for development of autoimmune disease in the fetus, use during pregnancy only if clearly needed. A pregnancy registry has been established to monitor outcomes of women exposed to abatacept during pregnancy (1-877-311-8972).

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for adverse reactions and possible effects on the developing immune system, breast-feeding is not recommended.

Adverse Reactions**Note:** Percentages not always reported; COPD patients experienced a higher frequency of COPD-related adverse reactions (COPD exacerbation, cough, dyspnea, pneumonia, rhonchi)

>10%:

Central nervous system: Headache (≤18%)

Gastrointestinal: Nausea

Respiratory: Nasopharyngitis (12%), upper respiratory tract infection

Miscellaneous: Infection (adults 54%; children 36%), antibody formation (2% to 41%)

1% to 10%:

Cardiovascular: Hypertension (7%)

Central nervous system: Dizziness (9%), fever

Dermatologic: Rash (4%)

Gastrointestinal: Dyspepsia (6%), abdominal pain, diarrhea

Genitourinary: Urinary tract infection (6%)

Neuromuscular & skeletal: Back pain (7%), limb pain (3%)

Respiratory: Cough (8%), bronchitis, pneumonia, rhinitis, sinusitis

Miscellaneous: Infusion-related reactions (2% to 9%), herpes simplex, influenza

<1%, postmarketing, and/or case reports: Acute lymphocytic leukemia, anaphylaxis, anaphylactoid reactions, cellulitis, COPD exacerbation,

disease flare, diverticulitis, dyspnea, flushing, hypersensitivity, hypotension, joint wear, lung cancer, lymphoma; malignancies (including bile duct, bladder, breast, cervical, melanoma, myelodysplastic syndrome, prostate, renal, skin, thyroid and uterine); ovarian cyst, pruritus, pyelonephritis, rhonchi, urticaria, varicella infection, wheezing

Drug Interactions

Anti-TNF Agents: May enhance the adverse/toxic effect of Abatacept. An increased risk of serious infection during concomitant use has been reported. *Risk D: Consider therapy modification*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid echinacea (has immunostimulant properties; consider therapy modifications).

Test InteractionsContains maltose; may result in falsely elevated blood glucose levels with dehydrogenase pyrroloquinolinequinone or glucose-dye-oxidoreductase testing methods on the day of infusion. Glucose monitoring methods which utilize glucose dehydrogenase nicotine adenine dinucleotide (GDH-NAD), glucose oxidase, or glucose hexokinase are recommended.

Monitoring ParametersSigns and symptoms of infection, signs and symptoms of infusion reaction; hepatitis and TB screening prior to therapy initiation

Nursing: Physical Assessment/MonitoringMonitor therapeutic response and adverse reactions. Perform testing for tuberculosis prior to initiating therapy. Assess for infection prior to initiating infusion. Teach patient appropriate interventions to reduce side effects and adverse symptoms to report.

Monitoring: Lab TestsHepatitis and TB screening prior to therapy initiation

Patient EducationThis drug can only be administered by infusion. You may be more susceptible to infections. Report signs of infection. Avoid immunizations unless approved by prescriber. May cause falsely elevated blood glucose readings on day of infusion. You may experience headache, sore throat, and nausea. Report immediately respiratory difficulty, hives, dizziness, nausea, flushing, cough, or wheezing. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]:

Orencia®: 250 mg [contains maltose]

Generic AvailableNo

ManufacturerBristol-Myers Squibb Company

Pricing: U.S. (www.drugstore.com)

Solution (reconstituted) (Orencia)

250 mg (1): $511.47

Mechanism of ActionSelective costimulation modulator; inhibits T-cell (T-lymphocyte) activation by binding to CD80 and CD86 on antigen presenting cells (APC), thus blocking the required CD28 interaction between APCs and T cells. Activated T lymphocytes are found in the synovium of rheumatoid arthritis patients.

Pharmacodynamics/Kinetics

Distribution: V_{ss}: 0.02-0.13 L/kg

Half-life elimination: 8-25 days

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentMay cause nausea; concomitant use with SSRIs, lithium, valproic acid, and carbamazepine may produce additive effects

Index TermsCTLA-4Ig

Abciximab

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(ab SIK si mab)

U.S. Brand NamesReoPro®

Canadian Brand NamesReopro®

Pharmacologic CategoryAntiplatelet Agent, Glycoprotein IIb/IIIa Inhibitor

Use: Labeled IndicationsPrevention of acute cardiac ischemic complications in patients at high risk for abrupt closure of the treated coronary vessel and patients at risk of restenosis; an adjunct with heparin to prevent cardiac ischemic complications in patients with unstable angina not responding to conventional therapy when a percutaneous coronary intervention (PCI) is scheduled within 24 hours

Use: Unlabeled/InvestigationalAcute MI - combination regimen of abciximab (full dose), tenecteplase (half dose), and heparin (unlabeled dose)

Dosing: Adults

Prevention of restenosis (patients at high risk for abrupt closure): I.V.: 0.25 mg/kg bolus administered 10-60 minutes before the start of intervention followed by an infusion of 0.125 mcg/kg/minute (maximum: 10 mcg/minute) for 12 hours

Patients with unstable angina not responding to conventional medical therapy and with planned percutaneous coronary intervention within 24 hours: I.V.: 0.25 mg/kg intravenous bolus followed by an 18- to 24-hour intravenous infusion of 10 mcg/minute, concluding 1 hour after the percutaneous coronary intervention.

Acute MI combination regimen (unlabeled): Half-dose tenecteplase (15-25 mg based on weight), abciximab 0.25 mg/kg bolus then 0.125 mcg/kg/minute (maximum: 10 mcg/minute) for 12 hours and heparin dosing as follows: Concurrent bolus of 40 units/kg (maximum: 3000 units), then 7 units/kg/hour (maximum: 800 units/hour) as continuous infusion. Adjust to aPTT target of 50-70 seconds.

Dosing: ElderlyRefer to adult dosing.

Calculations

- Abciximab

Administration: I.V.Abciximab is intended for coadministration with aspirin postangioplasty and heparin infused and weight adjusted to maintain a therapeutic bleeding time (eg, ACT 300-500 seconds). Solution must be filtered prior to administration. Do not shake the vial.

Administration: I.V. Detail

Bolus dose: Aseptically withdraw the necessary amount of abciximab for the bolus dose into a syringe using a 0.2 or 5 micron low protein-binding syringe filter (or equivalent); the bolus should be administered 10-60 minutes before the procedure

Continuous infusion: Aseptically withdraw amount required of abciximab for the infusion through a 0.2 or 5 micron low protein-binding syringe filter into a syringe; inject this into 250 mL of NS or D_5W to make solution. If a syringe filter was not used when preparing the infusion, administer using an in-line 0.2 or 0.22 micron low protein-binding filter. **Note:** Alternatively, a standard concentration of 7.2 mg in 250 mL of NS or D_5W may also be prepared for all patients and administered at the standard dose (0.125 mcg/kg/minute; maximum: 10 mcg/minute) with a variable rate in mL/hour. Infuse for 12-24 hours via pump after bolus dose; length of therapy dependent on indication.

StorageVials should be stored at 2°C to 8°C. Do not freeze or shake. After admixture, the prepared solution is stable for 12 hours.

CompatibilityAbciximab should be administered in a separate intravenous line. No incompatibilities have been observed with glass bottles or PVC bags.

ContraindicationsHypersensitivity to abciximab, to murine proteins, or any component of the formulation; active internal hemorrhage or recent (within 6 weeks) clinically-significant GI or GU bleeding; history of cerebrovascular accident within 2 years or cerebrovascular accident with significant neurological deficit; clotting abnormalities or administration of oral anticoagulants within 7 days unless prothrombin time (PT) is ≤1.2 times control PT value; thrombocytopenia (<100,000 cells/µL); recent (within 6 weeks) major surgery or trauma; intracranial tumor, arteriovenous malformation, or aneurysm; severe uncontrolled hypertension; history of vasculitis; use of dextran before PTCA or intent to use dextran during PTCA; concomitant use of another parenteral GP IIb/IIIa inhibitor

Allergy Considerations

- Glycoprotein (GP) IIb/IIIa Inhibitor Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Administration may result in human antichimeric antibody formation that can cause hypersensitivity reactions (including anaphylaxis).

- Bleeding: The most common complication is bleeding, including retroperitoneal, pulmonary, and spontaneous GI and/or GU bleeding; watch closely for bleeding, especially the arterial access site for the cardiac catheterization. Use with extreme caution in patients with platelet counts <150,000/mm^3, patients with hemorrhagic retinopathy, previous history of GI disease, recent thrombolytic therapy and in chronic dialysis patients. Use caution with administration of other drugs affecting hemostasis. Minimize other procedures including arterial and venous punctures, I.M. injections, nasogastric tubes, etc. Increased risk of hemorrhage during or following angioplasty is associated with unsuccessful PTCA, PTCA procedure >70 minutes duration, or PTCA performed within 12 hours of symptom onset for acute myocardial infarction.

- Thrombocytopenia: Administration may result in human antichimeric antibody formation that can cause thrombocytopenia; readministration within 30 days or in patients with human antichimeric antibodies (HACA) increases the incidence and severity of thrombocytopenia.

Special populations:

- Elderly: Use with caution in patients >65 years of age; increased risk of bleeding.

- Low weight patients: Use with caution in patients weighing <75 kg; increased risk of bleeding.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Diminished efficacy: Administration may result in human antichimeric antibody formation that can cause diminished efficacy.

- Sheath removal: Prior to pulling the sheath, heparin should be discontinued for 3-4 hours and ACT ≤175 seconds or aPTT ≤50 seconds. Use standard compression techniques after sheath removal. Watch the site closely afterwards for further bleeding.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. *In vitro* studies have shown only small amounts of abciximab to cross the placenta. It is not known whether abciximab can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsAs with all drugs which may affect hemostasis, bleeding is associated with abciximab. Hemorrhage may occur at virtually any site. Risk is dependent on multiple variables, including the concurrent use of multiple agents which alter hemostasis and patient susceptibility.

>10%:

Cardiovascular: Hypotension (14%), chest pain (11%)

Gastrointestinal: Nausea (14%)

Hematologic: Minor bleeding (4% to 17%)

Neuromuscular & skeletal: Back pain (18%)

1% to 10%:

Cardiovascular: Bradycardia (5%), peripheral edema (2%)

Central nervous system: Headache (7%)

Gastrointestinal: Vomiting (7%), abdominal pain (3%)

Hematologic: Major bleeding (1% to 14%), thrombocytopenia: <100,000 cells/mm^3 (3% to 6%); <50,000 cells/mm^3 (0.4% to 2%)

Local: Injection site pain (4%)

<1% (Limited to important or life-threatening): Abnormal thinking, abnormal vision, agitation, allergic reactions/anaphylaxis (possible), anemia, anxiety, arteriovenous fistula, bronchitis, bronchospasm, bullous eruption, cellulitis, coma, complete AV block, confusion, cystalgia, diabetes mellitus, diaphoresis increased, diarrhea, diplopia, dizziness, dyspepsia, dysuria, embolism, gastroesophageal reflux, hyperkalemia, hypertonia, hypoesthesia, ileus, incomplete AV block, inflammation, intracranial hemorrhage, leukocytosis, muscle contractions, myalgia, nodal arrhythmia, pain, palpitation, peripheral coldness, petechiae, pleural effusion, pneumonia, prostatitis, pruritus, pseudoaneurysm, pulmonary embolism, stroke, thrombophlebitis, urinary incontinence, urinary retention, ventricular tachycardia, weakness, xerostomia

Drug Interactions

Anticoagulants: Antiplatelet Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of other Antiplatelet Agents. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Dextran: May enhance the anticoagulant effect of Abciximab. *Risk X: Avoid combination*

Drotrecogin Alfa: Antiplatelet Agents may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Antiplatelet Agents. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Monoclonal Antibodies: Abciximab may enhance the potential for allergic or hypersensitivity reactions to Monoclonal Antibodies. Also may cause thrombocytopenia or diminished therapeutic effects. **Exceptions:** Alefacept. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Salicylates: Antiplatelet Agents may enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Thrombolytic Agents: Antiplatelet Agents may enhance the anticoagulant effect of Thrombolytic Agents. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

Monitoring ParametersProthrombin time, activated partial thromboplastin time (aPTT), hemoglobin, hematocrit, platelet count, fibrinogen, fibrin split products, transfusion requirements, signs of hypersensitivity reactions, guaiac stools, Hemastix® urine. Platelet count should be monitored at baseline, 2-4 hours following bolus infusion, and at 24 hours (or prior to discharge, if before 24 hours). To minimize risk of bleeding:

Abciximab initiated 18-24 hours prior to PCI: Maintain aPTT between 60-85 seconds during the heparin/abciximab infusion period

During PCI: Maintain ACT between 200-300 seconds

Following PCI (if anticoagulation is maintained): Maintain aPTT between 50-75 seconds

Sheath removal should not occur until aPTT is ≤50 seconds or ACT ≤175 seconds.

Maintain bleeding precautions, avoid unnecessary arterial and venous punctures, use saline or heparin lock for blood drawing, assess sheath insertion site and distal pulses of affected leg every 15 minutes for the first hour and then every 1 hour for the next 6 hours. Arterial access site care is important to prevent bleeding. Care should be taken when attempting vascular access that only the anterior wall of the femoral artery is punctured, avoiding a Seldinger (through and through) technique for obtaining sheath access. Femoral vein sheath placement should be avoided unless needed. While the vascular sheath is in place, patients should be maintained on complete bedrest with the head of the bed at a 30° angle and the affected limb restrained in a straight position.

Observe patient for mental status changes, hemorrhage; assess nose and mouth mucous membranes, puncture sites for oozing, ecchymosis, and hematoma formation; and examine urine, stool, and emesis for presence of occult or frank blood; gentle care should be provided when removing dressings.

Nursing: Physical Assessment/MonitoringMonitor vital signs and laboratory results prior to, during, and after therapy. Assess infusion insertion site and peripheral pulses during and after therapy. Observe and teach patient bleeding precautions (avoid invasive procedures and activities that could result in injury). Monitor closely for signs of excessive bleeding. **Pregnancy risk factor C.** Note breast-feeding caution.

Monitoring: Lab TestsProthrombin time, activated partial thromboplastin time (aPTT), hemoglobin, hematocrit, platelet count, fibrinogen, fibrin split products, transfusion requirements, signs of hypersensitivity reactions, guaiac stools, Hemastix® urine. Platelet count should be monitored at baseline, 2-4 hours following bolus infusion, and at 24 hours (or prior to discharge, if before 24 hours). To minimize risk of bleeding:

Abciximab initiated 18-24 hours prior to PCI: Maintain aPTT between 60-85 seconds during the heparin/abciximab infusion period

During PCI: Maintain ACT between 200-300 seconds

Following PCI (if anticoagulation is maintained): Maintain aPTT between 50-75 seconds

Sheath removal should not occur until aPTT is ≤50 seconds or ACT ≤175 seconds.

Patient EducationThis medication can only be administered I.V. You will have a tendency to bleed easily following this medication; use caution to prevent injury (use electric razor, soft toothbrush, and use caution with knives, needles, or anything sharp). If bleeding occurs, apply pressure to bleeding spot until bleeding stops completely. Report unusual bruising or bleeding; blood in urine, stool, or vomitus; bleeding gums; or vision changes. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

ReoPro®: 2 mg/mL (5 mL)

Generic AvailableNo

Mechanism of ActionFab antibody fragment of the chimeric human-murine monoclonal antibody 7E3; this agent binds to platelet IIb/IIIa receptors, resulting in steric hindrance, thus inhibiting platelet aggregation

Pharmacodynamics/KineticsHalf-life elimination: ~30 minutes

Related Information

- Glycoprotein Antagonists

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: As with all anticoagulants, bleeding is a potential adverse effect of abciximab during dental surgery; risk is dependent on multiple variables, including the intensity of anticoagulation and patient susceptibility. Medical consult is suggested. It is unlikely that ambulatory patients presenting for dental treatment will be taking intravenous anticoagulant therapy.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular Considerations

Acute Coronary Syndrome (ACS): The 2002 ACC/AHA guidelines for unstable angina/non-ST-segment elevation myocardial infarctions (UA/NSTEMI) recommend administration of intravenous glycoprotein IIb/IIIa inhibitors (along with ASA and heparin) in patients with non-ST-segment elevation ACS who are expected to undergo catheterization and PCI. In such patients in which PCI in **not** expected, eptifibatide or tirofiban should be administered (along with ASA and either heparin or LMWH) if high-risk features (eg, positive biochemical markers of infarction, ST-segment depression, sustained VT, >75 years of age, or signs of LV dysfunction) or refractory ischemia are present.

Percutaneous Coronary Intervention (PCI): A glycoprotein IIb/IIIa inhibitor is recommended for patients who will undergo PCI, especially those with unstable angina or other high risks for postprocedure ischemic complications. In the TARGET trial, abciximab (FDA-approved dose) and tirofiban (10 mcg/kg bolus; infusion of 0.15 mcg/kg/minute for 18-24 hours) were compared to each other in patients undergoing coronary stenting. The primary endpoint was death, nonfatal MI, or urgent target vessel revascularization at 30 days. Abciximab improved outcome to a greater extent than tirofiban did primarily by reducing nonfatal MI. Follow-up at 6 months revealed no significant difference in primary outcomes between treatments, but a trend existed in favor of abciximab reducing the occurrence of MIs.

STEMI: Adjunct to Thrombolysis: In the GUSTO V trial, patients with acute MI were randomized to standard-dose reteplase or half-dose reteplase (two boluses of 5 units each, 30 minutes apart) and full-dose abciximab. Mortality at 30 days (primary endpoint) was similar in both groups. The combination treatment group had significantly fewer reinfarctions or recurrent episodes of ischemia. Combination treatment was also associated with less need for urgent revascularization. More bleeding occurred in the combination treatment group, but the incidence of nonfatal disabling stroke and stroke of any type were similar in both groups. Overall, no difference in intracranial hemorrhages was observed between the two treatments, but a trend towards an increased incidence occurred in patients >75 years of age who received combination treatment. Patients with acute MI were randomized in an open-label study to full-dose tenecteplase and enoxaparin, half-dose tenecteplase with low-dose, weight-based heparin and a 12-hour infusion of abciximab or full-dose tenecteplase with weight-based heparin (ASSENT-3 Investigators, 2001). The primary endpoint (30 days) was mortality, in-house reinfarction, and in-house refractory ischemia. The abciximab arm and the enoxaparin arm had significantly less mortality, reinfarction, and refractory ischemia than in the unfractionated heparin/full-dose tenecteplase. One year mortality (secondary endpoint) was similar in all three treatment arms (Sinnaeve PR, 2004). However, the 1-year outcome tended to be worse with abciximab in patients with diabetes. The 2004 ACC/AHA guidelines for STEMI recommend that pharmacologic reperfusion with abciximab and half-dose reteplase or tenecteplase may be considered in patients <75 years of age with anterior wall infarctions and no risk factors for bleeding.

Platelet Effects: Abciximab has a long duration of action and platelet effects reverse slowly. It can take 24-48 hours for platelet function to return to normal after discontinuation of infusion making it difficult to use in patients likely to need CABG. Antiplatelet effects can be reversed with platelet transfusions. Platelet count monitoring is recommended 2-4 hours after initiation, and at 24 hours or prior to discharge, whichever is first. Acute profound thrombocytopenia with abciximab occurs within 24 hours of administration and may be treated by discontinuing the infusion (if still running) and administering platelets. Platelet counts should recover rapidly after discontinuation.

Anesthesia and Critical Care Concerns/Other Considerations**Platelet Effects:** Abciximab has a long duration of action and platelet effects reverse slowly. It can take 24-48 hours for platelet function to return to normal after discontinuation of infusion making it difficult to use in patients likely to need CABG. Antiplatelet effects can be reversed with platelet transfusions. Platelet count monitoring is recommended 2-4 hours after initiation, and at 24 hours or prior to discharge, whichever is first. Acute profound thrombocytopenia with abciximab occurs within 24 hours of administration and may be treated by discontinuing the infusion (if still running) and administering platelets. Platelet counts should recover rapidly after discontinuation.

Pronunciation(a kam PROE sate)

U.S. Brand NamesCampral®

Canadian Brand NamesCampral®

Pharmacologic CategoryGABA Agonist/Glutamate Antagonist

Use: Labeled IndicationsMaintenance of alcohol abstinence

Dosing: AdultsAlcohol abstinence: Oral: 666 mg 3 times/day (a lower dose may be effective in some patients).

Adjustment in patients with low body weight (unlabeled): A lower dose (4 tablets/day) may be considered in patients with low body weight (eg, <60 kg).

Note: Treatment should be initiated as soon as possible following the period of alcohol withdrawal, when the patient has achieved abstinence.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} 30-50 mL/minute: Initial dose should be reduced to 333 mg 3 times/day.

Cl_{cr} <30 mL/minute: Contraindicated in severe renal impairment.

Calculations

- Creatinine Clearance: Adults

Administration: OralMay be administered without regard to meals. Tablet should be swallowed whole; do not crush or chew.

Dietary ConsiderationsMay be taken without regard to meals. Each 333 mg tablet contains 33 mg of elemental calcium.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to acamprosate or any component of the formulation; severe renal impairment (Cl_{cr} <30 mL/minute)

Warnings/Precautions

Concerns related to adverse effects:

- Suicidal ideation/attempt: Attempted and completed suicides have occurred in acamprosate-treated patients; use with caution in suicidal ideation. Monitor for depression and/or suicidal thinking.

Disease-related concerns:

- Alcohol dependence: Appropriate use: Should be used as part of a comprehensive program to treat alcohol dependence. Treatment should be initiated as soon as possible following the period of alcohol withdrawal, when the patient has achieved abstinence. Acamprosate does not eliminate or diminish the symptoms of alcohol withdrawal.

- Renal impairment: Use with caution in patients with moderate renal impairment (Cl_{cr} 30-50 mL/minute).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Sulfites: Traces of sulfites may be present in the formulation.

Geriatric ConsiderationsInitial studies did not include sufficient geriatric patients to be able to derive sufficient data to compare elderly to younger adults. Only 41 out of 4234 patients in clinical trials were ≥65 years of age with none ≥75 years. However, since this medication is cleared renally exclusively, caution should be used since many elderly have Cl_{cr} 30-50 mL/minute where dosage reduction is required (see Dosage).

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic in animal studies. No adequate or well-controlled studies in pregnant women; use only if potential benefit outweighs possible risk to the fetus.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

Note: Many adverse effects associated with treatment may be related to alcohol abstinence; reported frequency range may overlap with placebo.

>10%: Gastrointestinal: Diarrhea (10% to 17%)

1% to 10%:

Cardiovascular: Syncope, palpitation, edema (peripheral)

Central nervous system: Insomnia (6% to 9%), anxiety (5% to 8%), depression (4% to 8%), dizziness (3% to 4%), pain (2% to 4%), paresthesia (2% to 3%), headache, somnolence, amnesia, tremor, chills

Dermatologic: Pruritus (3% to 4%), rash

Endocrine & metabolic: Weight gain, libido decreased

Gastrointestinal: Anorexia (2% to 5%), flatulence (1% to 3%), nausea (3% to 4%), abdominal pain, dry mouth (1% to 3%), vomiting, dyspepsia, constipation, appetite increased, taste perversion

Genitourinary: Impotence

Neuromuscular & skeletal: Weakness (5% to 7%), back pain, myalgia, arthralgia

Ocular: Abnormal vision

Respiratory: Rhinitis, dyspnea, pharyngitis, bronchitis

Miscellaneous: Diaphoresis (2% to 3%), suicide attempt

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Angina, asthma, exfoliative dermatitis, gastrointestinal hemorrhage, hallucinations, hypothyroidism, MI, ophthalmitis, pancreatitis, photosensitivity, psychosis, pulmonary embolus, renal calculus, renal failure, seizure, suicidal ideation, suicide attempts, suicide completion

Drug InteractionsThere are no known significant interactions.

Ethanol/Nutrition/Herb Interactions

Ethanol: Abstinence is required during treatment. Ethanol does not affect the pharmacokinetics of acamprosate; however, the continued use of ethanol will decrease desired efficacy of acamprosate.

Food: Food decreases absorption of acamprosate (not clinically significant).

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and potential interactions. May cause depression. Monitor for suicide ideation.

Patient EducationTaking this medication helps maintain abstinence only when used as part of a treatment program that includes counseling and support. Swallow tablet whole. Do not chew or crush. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake by prescriber. Can cause drowsiness (use caution when driving or engaging in activities requiring alertness until response to drug is known). You may experience diarrhea (buttermilk, boiled milk, or yogurt may help), peripheral edema, insomnia, anxiety, depression, and generalized weakness. Report persistent diarrhea, excessive or sudden weight gain, swelling of extremities, respiratory difficulties, fainting, or thoughts of suicide. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber before breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, enteric coated, delayed release, as calcium:

Campral®: 333 mg [contains calcium 33 mg and sulfites]

Generic AvailableNo

ManufacturerForest Pharmaceuticals

Pricing: U.S. (www.drugstore.com)

Tablet, EC (Campral)

333 mg (180): $136.08

Tablet, EC (Campral Dose Pak)

333 mg (180): $150.10

Mechanism of ActionMechanism not fully defined. Structurally similar to gamma-amino butyric acid (GABA), acamprosate appears to increase the activity of the GABA-ergic system, and decreases activity of glutamate within the CNS, including a decrease in activity at N-methyl D-aspartate (NMDA) receptors; may also affect CNS calcium channels. Restores balance to GABA and glutamate activities which appear to be disrupted in alcohol dependence. During therapeutic use, reduces alcohol intake, but does not cause a disulfiram-like reaction following alcohol ingestion.

Pharmacodynamics/Kinetics

Distribution: V_d: 1 L/kg

Protein binding: Negligible

Metabolism: Not metabolized

Bioavailability: 11%

Half-life elimination: 20-33 hours

Excretion: Urine (as unchanged drug)

Related Information

- Addiction Treatments

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation) and taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Index Terms Acamprosate Calcium; Calcium Acetylhomotaurinate

Medication Safety Issues

Sound-alike/look-alike issues:

Precose® may be confused with PreCare®

International issues:

Precose® may be confused with Precosa® which is a brand name for *Saccharomyces boulardii* in Denmark, Finland, Norway, and Sweden

Pronunciation(AY car bose)
U.S. Brand NamesPrecose®
Canadian Brand NamesGlucobay™
Pharmacologic CategoryAntidiabetic Agent, Alpha-Glucosidase Inhibitor
Use: Labeled IndicationsAdjunct to diet and exercise to lower blood glucose in patients with type 2 diabetes mellitus (noninsulin dependent, NIDDM)
Dosing: AdultsType 2 diabetes: Oral:

Initial: 25 mg 3 times/day with the first bite of each main meal; to reduce GI effects, some patients may benefit from initiating at 25 mg once daily with gradual titration to 25 mg 3 times/day as tolerated

Maintenance dose: Should be adjusted at 4- to 8-week intervals based on 1-hour postprandial glucose levels and tolerance until maintenance dose is reached; maintenance dose: 50-100 mg 3 times/day. Dosage must be individualized on the basis of effectiveness and tolerance while not exceeding the maximum recommended dose.

Maximum:

≤60 kg: 50 mg 3 times/day

>60 kg: 100 mg 3 times/day

Patients receiving sulfonylureas or insulin: Acarbose given in combination with a sulfonylurea or insulin will cause a further lowering of blood glucose and may increase the hypoglycemic potential of the sulfonylurea or insulin. If hypoglycemia occurs, appropriate adjustments in the dosage of these agents should be made.

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal Impairment

Cl_{cr} <25 mL/minute: Peak plasma concentrations were 5 times higher and AUCs were 6 times larger than in volunteers with normal renal function.

Significant renal dysfunction (S_{cr} >2 mg/dL): Use is not recommended.

Administration: OralShould be **administered with the first bite of each main meal.**
Dietary ConsiderationsTake with food (first bite of meal).
StorageStore at <25°C (77°F). Protect from moisture.
ContraindicationsHypersensitivity to acarbose or any component of the formulation; patients with diabetic ketoacidosis or cirrhosis; patients with inflammatory bowel disease, colonic ulceration, partial intestinal obstruction, or in patients predisposed to intestinal obstruction; patients who have chronic intestinal diseases associated with marked disorders of digestion or absorption, and in patients who have conditions that may deteriorate as a result of increased gas formation in the intestine
Warnings/Precautions

Concerns related to adverse effects:

- Elevated serum transaminases: Treatment-emergent elevations of serum transaminases (AST and/or ALT) occurred in up to 14% of acarbose-treated patients in long-term studies. These serum transaminase elevations appear to be dose related. At doses >100 mg 3 times/day, the incidence of serum transaminase elevations greater than 3 times the upper limit of normal was 2-3 times higher in the acarbose group than in the placebo group. These elevations were asymptomatic, reversible, more common in females, and, in general, were not associated with other evidence of liver dysfunction. Fulminant hepatitis has been reported rarely.

Disease-related concerns:

- Renal impairment: Use not recommended in patients with significant impairment (S_{cr} >2 mg/dL); use with caution in other patients with renal impairment.

- Stress-related states: It may be necessary to discontinue acarbose and administer insulin if the patient is exposed to stress (ie, fever, trauma, infection, surgery).

Concurrent drug therapy issues:

- Sulfonylureas/insulin: In combination with a sulfonylurea or insulin will cause a further lowering of blood glucose and may increase the hypoglycemic potential of the sulfonylurea or insulin.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsNo specific trials in older adults have been conducted; mean age in clinical trials has been <60 years; monitor change in preprandial blood glucose concentrations to account for potential age-related changes in postprandial glucose. In clinical trials, elderly had serum concentrations 1.5 times those of younger adults. Patients with Cl_{cr} <25 mL/minute had serum concentrations 5 times those with normal renal clearance. No clinical significance can be attributed to this at this time. No adjustments in dose are recommended. Intensive glucose control (Hb A_{1c} <6.5) has been linked to increased all cause and cardiovascular mortality, hypoglycemia requiring assistance, and weight gain in adult type 2 diabetes. For elderly patients with diabetes who are relatively healthy, attaining target goals for aspirin use, blood pressure, lipids, smoking cessation, and diet and exercise may be more important than normalized glycemic control.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events have not been reported in animal reproduction studies; therefore, acarbose is classified as pregnancy category B. Low amounts of acarbose are absorbed systemically which should limit fetal exposure. Maternal hyperglycemia can be associated with adverse effects in the fetus, including macrosomia, neonatal hyperglycemia, and hyperbilirubinemia; the risk of congenital malformations is increased when the Hb A_{1c} is above the normal range. Diabetes can also be associated with adverse effects in the mother. Poorly-treated diabetes may cause end-organ damage that may in turn negatively affect obstetric outcomes. Physiologic glucose levels should be maintained prior to and during pregnancy to decrease the risk of adverse events in the mother and the fetus. Acarbose has been studied for its potential role in treating GDM; however, only limited information is available describing pregnancy outcomes. Until additional safety and efficacy data are obtained, the use of oral agents is generally not recommended as routine management of GDM or type 2 diabetes mellitus during pregnancy. Insulin is the drug of choice for the control of diabetes mellitus during pregnancy.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known if acarbose is found in breast milk; however, low amounts of acarbose are absorbed systemically in adults, which may limit the amount that could distribute into breast milk. Breast-feeding is not recommended by the manufacturer.

Pregnancy & Lactation, In-Depth

- Acarbose in Pregnancy & Lactation

Adverse Reactions

>10%:

Gastrointestinal: Diarrhea (31%) and abdominal pain (19%) tend to return to pretreatment levels over time; frequency and intensity of flatulence (74%) tend to abate with time

Hepatic: Transaminases increased (≤4%)

Postmarketing and/or case reports: Edema, erythema, exanthema, hepatitis, ileus/subileus, jaundice, liver damage, rash, urticaria

Drug Interactions

Corticosteroids (Orally Inhaled): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Digoxin: Acarbose may decrease the serum concentration of Digoxin. *Risk C: Monitor therapy*

Herbs (Hypoglycemic Properties): May enhance the hypoglycemic effect of Hypoglycemic Agents. *Risk C: Monitor therapy*

Luteinizing Hormone-Releasing Hormone Analogs: May diminish the therapeutic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Pegvisomant: May enhance the hypoglycemic effect of Antidiabetic Agents. *Risk C: Monitor therapy*

Somatropin: May diminish the hypoglycemic effect of Antidiabetic Agents. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Limit ethanol.

Monitoring ParametersPostprandial glucose, glycosylated hemoglobin levels, serum transaminase levels should be checked every 3 months during the first year of treatment and periodically thereafter, renal function (serum creatinine); blood pressure

Reference RangeRecommendations for glycemic control in adults with diabetes:

Hb A_{1c}: <7%

Preprandial capillary plasma glucose: 70-130 mg/dL

Peak postprandial capillary blood glucose: <180 mg/dL

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess results of laboratory tests, therapeutic effectiveness, and adverse response on a regular basis throughout therapy. Teach patient proper use (or refer patient to diabetic educator), possible side effects/appropriate interventions (eg, importance of adequate hydration), and adverse symptoms to report.

Monitoring: Lab TestsPostprandial glucose, glycosylated hemoglobin levels, and serum transaminase levels should be checked every 3 months during the first year of treatment and periodically thereafter, renal function (serum creatinine)

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take this medication exactly as directed, with the first bite of each main meal. Do not change dosage or discontinue this medicine without first consulting prescriber. Do not take other medications with or within 2 hours of this medication unless advised by prescriber. Avoid alcohol. It is important to follow dietary and lifestyle recommendations of prescriber. You will be instructed in signs of hypo- or hyperglycemia by prescriber or diabetic educator. If combining acarbose with other diabetic medication (eg, sulfonylureas, insulin), keep source of glucose in the form of dextrose (NOT table sugar, candy, or cookies) on hand in case hypoglycemia occurs. May cause mild side effects during first weeks of acarbose therapy (eg, bloating, flatulence, diarrhea, abdominal discomfort); these should diminish over time. Report severe or persistent side effects, fever, extended vomiting or flu, or change in color of urine or stool. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 25 mg, 50 mg, 100 mg

Precose®: 25 mg, 50 mg, 100 mg

Generic AvailableYes

ManufacturerBayer Corp (Biological and Pharmaceutical Division)

Pricing: U.S. (www.drugstore.com)

Tablets (Acarbose)

25 mg (100): $81.99

50 mg (100): $87.99

100 mg (100): $89.99

Tablets (Precose)

25 mg (90): $85.52

50 mg (90): $88.49

100 mg (90): $102.58

Mechanism of ActionCompetitive inhibitor of pancreatic α-amylase and intestinal brush border α-glucosidases, resulting in delayed hydrolysis of ingested complex carbohydrates and disaccharides and absorption of glucose; dose-dependent reduction in postprandial serum insulin and glucose peaks; inhibits the metabolism of sucrose to glucose and fructose

Pharmacodynamics/Kinetics

Absorption: <2% as active drug; ~35% as metabolites

Metabolism: Exclusively via GI tract, principally by intestinal bacteria and digestive enzymes; 13 metabolites identified (major metabolites are sulfate, methyl, and glucuronide conjugates)

Bioavailability: Low systemic bioavailability of parent compound; acts locally in GI tract

Half-life elimination: ~2 hours

Time to peak: Active drug: ~1 hour

Excretion: Urine (~34% as inactive metabolites, <2% parent drug and active metabolite); feces (~51% as unabsorbed drug)

Related Information

- Diabetes Mellitus Management, Adults

Dental Health: Effects on Dental TreatmentAlthough acarbose does not cause hypoglycemia, it is frequently used in combination and may complicate the management of hypoglecemic episodes caused by other medications. As part of its therapeutic effect, acarbose slows the absorption of complex sugars or disaccharides such as sucrose. This would delay effective treatment of hypoglycemia. Simple sugars, including glucose (dextrose), are not affected. If a patient experiences hypoglycemia, use of food items such as table sugar, candy, or cookies will NOT effectively increase blood glucose. Administration of oral glucose is required in mild-moderate hypoglycemia, and parenteral glucose is required for severe hypoglycemia.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness

Mental Health: Effects on Psychiatric TreatmentAntipsychotics and tricyclic antidepressants may decrease the effects of acarbose. Monoamine oxidase inhibitors, SSRIs, and nefazodone may increase the effects of acarbose.

Cardiovascular ConsiderationsAcarbose produces a slight but statistically significant reduction in Hb A_{1c} (~1%) and fasting plasma glucose (~25 mg/dL). In general, acarbose may be used in combination with other agents (eg, sulfonylurea, metformin) or as monotherapy for patients with Type 2 diabetes. Therapy should be titrated slowly to minimize gastrointestinal side effects.

Medication Safety Issues

Sound-alike/look-alike issues:

Sectral® may be confused with Factrel®, Seconal®, Septra®

Pronunciation(a se BYOO toe lole)

U.S. Brand NamesSectral®

Canadian Brand NamesApo-Acebutolol®; Gen-Acebutolol; Monitan®; Novo-Acebutolol; Nu-Acebutolol; Rhotral; Rhoxal-acebutolol; Sandoz-Acebutolol; Sectral®

Pharmacologic CategoryAntiarrhythmic Agent, Class II; Beta Blocker With Intrinsic Sympathomimetic Activity

Use: Labeled IndicationsTreatment of hypertension; management of ventricular arrhythmias

Use: Unlabeled/InvestigationalTreatment of chronic stable angina

Dosing: Adults

Angina, ventricular arrhythmia: Oral: 400 mg/day in divided doses; maintenance: 600-1200 mg/day in divided doses; maximum: 1200 mg/day

Hypertension: Oral: 400-800 mg/day (larger doses may be divided); maximum: 1200 mg/day; usual dose range (JNC 7): 200-800 mg/day in 2 divided doses

Dosing: ElderlyOral: Initial: 200-400 mg/day; dose reduction due to age-related decrease in Cl_{cr} will be necessary; do not exceed 800 mg/day.

Dosing: Renal Impairment

Cl_{cr} 25-49 mL/minute: Reduce dose by 50%.

Cl_{cr} <25 mL/minute: Reduce dose by 75%.

Dosing: Hepatic ImpairmentUse with caution.

Calculations

- Creatinine Clearance: Adults

Administration: OralTo discontinue therapy, taper dose gradually over a period of 2 weeks. May be administered without regard to meals.

Dietary ConsiderationsMay be taken without regard to meals.

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F). Protect from light and dispense in a light-resistant, tight container.

ContraindicationsOvert cardiac failure; cardiogenic shock; persistently-severe bradycardia or second- and third-degree heart block (except in patients with a functioning artificial pacemaker)

Allergy Considerations

- Beta-Blocker Allergy

Warnings/Precautions

Concerns related to adverse events:

- Anaphylactic reactions: Use caution with history of severe anaphylaxis to allergens; patients taking beta-blockers may become more sensitive to repeated challenges. Treatment of anaphylaxis (eg, epinephrine) in patients taking beta-blockers may be ineffective or promote undesirable effects.

Disease-related concerns:

- Bronchospastic disease: In general, patients with bronchospastic disease should not receive beta-blockers; for patients with bronchospastic disease who do not respond to or cannot tolerate other therapies, initial low doses of acebutolol may be employed and used cautiously with close monitoring. Ensure patient has an inhaled $beta_2$-agonist immediately available.
- Conduction abnormality: Consider pre-existing conditions such as sick sinus syndrome before initiating.
- Diabetes: Use with caution in patients with diabetes mellitus; may potentiate hypoglycemia and/or mask signs and symptoms.
- Heart failure (HF): Beta-blockers with intrinsic sympathomimetic activity (eg, acebutolol) are likely to worsen survival in patients with HF and should be avoided. Beta-blockers shown to improve survival in clinical trials should be used in these patients.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Mesenteric vascular disease: Can precipitate or aggravate symptoms of arterial insufficiency in patients with mesenteric vascular disease. Use with caution in these patients. Observe closely for progression of arterial obstruction.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis.

- Peripheral vascular disease (PVD): Can precipitate or aggravate symptoms of arterial insufficiency in patients with PVD. Use with caution in these patients. Observe closely for progression of arterial obstruction.

- Pheochromocytoma (untreated): Adequate alpha$_1$-receptor blockade is required prior to use of any beta-blocker.

- Psychiatric disease: Use with caution in patients with a history of psychiatric illness; may cause or exacerbate CNS depression.

- Raynaud's disease: Use with caution in these patients with Raynaud's disease; may precipitate symptoms of Raynaud's.

- Renal impairment: Use with caution in patients with renal impairment, especially the elderly. Elimination of the metabolite, diacetolol, is reduced resulting in a two- to threefold increase in its half-life.

- Thyrotoxicosis: Beta-blockade may mask signs of hyperthyroidism (eg, tachycardia). Abrupt discontinuation may also induce a thyroid storm.

Special populations:

- Elderly: Use reduced doses in elderly patients; concentrations of acebutolol and diacetolol are significantly higher in the elderly. Dose should not exceed 800 mg/day.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Abrupt withdrawal: Beta-blocker therapy should not be withdrawn abruptly (particularly in patients with CAD), but gradually tapered to avoid acute tachycardia, hypertension, and/or ischemia.

Geriatric ConsiderationsSince bioavailability increased in elderly about twofold, geriatric patients may require lower maintenance doses, therefore, as serum and tissue concentrations increase beta$_1$ selectivity diminishes; due to alterations in the beta-adrenergic autonomic nervous system, beta-adrenergic blockade may result in less hemodynamic response than seen in younger adults. Studies indicate that despite decreased sensitivity to the chronotropic effects of beta-blockade with age, there appears to be an increased myocardial sensitivity to the negative inotropic effect during stress (ie, exercise). Controlled trials have shown the overall response rate for propranolol to be only 20% to 50% in elderly populations. Therefore, all beta-adrenergic blocking drugs may result in a decreased response as compared to younger adults. Adjust dose for renal function.

Pregnancy Risk FactorB (manufacturer); D (2nd and 3rd trimesters - expert analysis)

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. Acebutolol and its metabolite cross the human placenta. The neonatal half-life of acebutolol is 6-14 hours and diacetolol is 24-30 hours. Decreased birth weight, blood pressure, and heart rate have been observed in neonates following maternal use of acebutolol during pregnancy. Neonatal hypoglycemia has also been reported. Available evidence suggests beta-blockers are generally safe during pregnancy (JNC 7). Monitoring of the newborn is recommended.

LactationEnters breast milk/not recommended (AAP recommends “use with caution”)

Breast-Feeding ConsiderationsAcebutolol and its metabolites are found in human breast milk; the milk/plasma ratio is 7.1 for acebutolol and 12.2 for diacetolol. Hypotension, bradycardia, and tachypnea have been reported in nursing infants.

Adverse Reactions

>10%: Central nervous system: Fatigue (11%)

1% to 10%:

Cardiovascular: Chest pain (2%), edema (2%), bradycardia, hypotension, CHF

Central nervous system: Headache (6%), dizziness (6%), insomnia (3%), depression (2%), abnormal dreams (2%), anxiety, hyper-/hypoesthesia

Dermatologic: Rash (2%), pruritus

Gastrointestinal: Constipation (4%), diarrhea (4%), dyspepsia (4%), nausea (4%), flatulence (3%), abdominal pain, vomiting

Genitourinary: Micturition frequency (3%), dysuria, impotence, nocturia

Neuromuscular & skeletal: Myalgia (2%), back pain, joint pain

Ocular: Abnormal vision (2%), conjunctivitis, dry eyes, eye pain

Respiratory: Dyspnea (4%), rhinitis (2%), cough (1%), pharyngitis, wheezing

Postmarketing and/or case reports: Alkaline phosphatase increased, anorexia, AV block, bilirubin increased, cold extremities, drug-induced lupus-like syndrome, exacerbate pre-existing renal insufficiency, facial edema, hepatotoxic reaction, lichen planus, palpitation, pleurisy, pneumonitis, pulmonary granulomas, systemic lupus erythematosus, transaminases increased, urinary retention, ventricular arrhythmia, xerostomia

Potential adverse effects (based on experience with other beta-blocking agents) include agranulocytosis, allergic reactions, alopecia, catatonia, claudication, depression (reversible), disorientation, emotional lability, erythematous rash, ischemic colitis, laryngospasm, mesenteric artery thrombosis, Peyronie's disease, purpura, respiratory distress, short-term memory loss, slightly clouded sensorium, thrombocytopenia

Metabolism/Transport Effects**Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Beta-Blockers may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Blockers: Beta-Blockers may enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. *Risk D: Consider therapy modification*

Alpha2-Agonists: Beta-Blockers may enhance the rebound hypertensive effect of Alpha2-Agonists. This effect can occur when the alpha$_2$-agonist is abruptly withdrawn. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Aminoquinolines (Antimalarial): May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Amiodarone: May enhance the bradycardic effect of Beta-Blockers. Possibly to the point of cardiac arrest. Amiodarone may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Anilidopiperidine Opioids: May enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Barbiturates: May decrease the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Beta2-Agonists: Beta-Blockers (Beta1 Selective) may diminish the bronchodilatory effect of Beta2-Agonists. Of particular concern with nonselective beta-blockers or higher doses of the beta1 selective beta-blockers. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Beta-Blockers. Bradycardia and signs of heart failure have also been reported. Calcium Channel Blockers (Nondihydropyridine) may increase the serum concentration of Beta-Blockers. *Risk C: Monitor therapy*

Cardiac Glycosides: Beta-Blockers may enhance the bradycardic effect of Cardiac Glycosides. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Dipyridamole: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Disopyramide: May enhance the bradycardic effect of Beta-Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Insulin: Beta-Blockers may enhance the hypoglycemic effect of Insulin. *Risk C: Monitor therapy*

Lidocaine: Beta-Blockers may decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

Methacholine: Beta-Blockers may enhance the adverse/toxic effect of Methacholine. *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midodrine: Beta-Blockers may enhance the bradycardic effect of Midodrine. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Propafenone: May decrease the metabolism of Beta-Blockers. Propafenone possesses some independent beta blocking activity. *Risk C: Monitor therapy*

Propoxyphene: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: May decrease the metabolism of Beta-Blockers. *Risk C: Monitor therapy*

Reserpine: May enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May decrease the serum concentration of Beta-Blockers. **Exceptions:** Rifabutin. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Theophylline Derivatives: Beta-Blockers (Beta1 Selective) may diminish the bronchodilatory effect of Theophylline Derivatives. This is true at higher beta-blockers doses where cardioselectivity is lost. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Peak serum acebutolol levels may be slightly decreased if taken with food.

Herb/Nutraceutical: Avoid dong quai if using for hypertension (has estrogenic activity). Avoid yohimbe, ginseng (may worsen hypertension).

Test InteractionsIncreased AST, ALT, alkaline phosphatase, bilirubin, cholesterol, glucose, LDH, potassium, thyroxine, triglycerides, uric acid; decreased HDL

Monitoring ParametersBlood glucose; blood pressure, orthostatic hypotension, heart rate, CNS effects, ECG

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Assess results of laboratory tests, therapeutic effectiveness, and adverse response on a regular basis during therapy. When discontinuing therapy, taper dosage over 2 weeks. Assess knowledge/teach patient appropriate use, possible side effects (including altered glucose tolerance for patients with diabetes)/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsBlood glucose

Patient EducationTake exactly as directed; do not increase, decrease, or adjust dosage without consulting prescriber. May be taken without regard to meals. Take pulse daily, prior to medication, and follow prescriber's instruction about holding medication. Do not take with antacids. Do not use OTC medications such as cold remedies without consulting prescriber. If you have diabetes, monitor serum sugar closely (drug may alter glucose tolerance or mask signs of hypoglycemia). May cause fatigue, dizziness (use caution when driving or engaging in tasks that require alertness until response to drug is known); postural hypotension (use caution when changing position from lying or sitting to standing or when climbing stairs); or alteration in sexual performance (reversible). Report chest pain or palpitations, unresolved swelling of extremities or unusual weight gain, respiratory difficulty or new cough, skin rash, unresolved fatigue, unresolved constipation or diarrhea, unusual muscle weakness, or CNS disturbances. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.

Capsules (Sectral)

200 mg (60): $169.99

400 mg (30): $124.99

Mechanism of ActionCompetitively blocks beta$_1$-adrenergic receptors with little or no effect on beta$_2$-receptors except at high doses; exhibits membrane stabilizing and intrinsic sympathomimetic activity

Pharmacodynamics/Kinetics

Onset of action: 1-2 hours

Duration: 12-24 hours

Absorption: Oral: 40%

Protein binding: ~26%

Metabolism: Extensive first-pass effect to equipotent and cardioselective diacetolol metabolite

Half-life elimination: Parent drug: 3-4 hours; Metabolite: 8-13 hours

Time to peak: 2-4 hours

Excretion: Feces (50% to 60%); urine (30% to 40%); diacetolol eliminated primarily in the urine

Related Information

- Beta-Blockers

Dental Health: Effects on Dental TreatmentAcebutolol is a cardioselective beta-blocker. Local anesthetic with vasoconstrictor can be safely used in patients medicated with acebutolol. Nonselective beta-blockers (ie, propranolol, nadolol) enhance the pressor response to epinephrine, resulting in hypertension and bradycardia; this has not been reported for acebutolol. Many nonsteroidal anti-inflammatory drugs, such as ibuprofen and indomethacin, can reduce the hypotensive effect of beta-blockers after 3 or more weeks of therapy with the NSAID. Short-term NSAID use (ie, 3 days) requires no special precautions in patients taking beta-blockers.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions. Local anesthetic with vasoconstrictor can be safely used in patients medicated with acebutolol.

Mental Health: Effects on Mental StatusDrowsiness/fatigue is common; may cause insomnia, depression, abnormal dreams, and polyuria

Mental Health: Effects on Psychiatric TreatmentAdditive hypotensive and/or sedative effects may be seen with concurrent use of antipsychotics, antidepressants, or benzodiazepines

Cardiovascular ConsiderationsThis drug possesses intrinsic sympathomimetic activity (ISA). While beta-blockers with ISA induce fewer side effects, the cardiovascular benefits listed below are less clear than for beta-blockers without ISA.

Heart Failure: Beta-blockers with ISA (eg, acebutolol) are likely to worsen survival and should be avoided. Beta-blockers shown to improve survival in clinical trials should be used in these patients.

Hypertension: Beta-blocker therapy in the treatment of hypertension has been associated with improved cardiovascular outcomes. According to the 2003 JNC-VII guidelines for the treatment of hypertension, most patients with hypertension will require treatment with at least 2 antihypertensives. First-line therapy for hypertension is a diuretic (eg, hydrochlorothiazide or chlorthalidone). When a diuretic cannot be used or when a compelling indication exists for another drug, other types of antihypertensives may be used (eg, ACEIs, ARBs, beta-blockers, CCBs). Beta-blockers are among the multiple choices of agents that have shown benefit in a number of different patient subtypes. Compelling indications for a beta-blocker include patients with heart failure, postmyocardial infarction, high coronary disease risk, or diabetes. In type 2 diabetic patients, a UK Prospective Diabetes Study Group (UKPDS) trial showed that beta-blocker therapy (atenolol) was as effective as an ACE inhibitor in reducing cardiovascular events and that the benefits of therapy were related more to the degree of antihypertensive efficacy rather than the class of drug used.

Treatment should be targeted to a goal blood pressure of <140/90 mm Hg. If diabetes or renal disease coexists, the blood pressure goal should be <130/80 mm Hg.

Withdrawal: Beta-blocker therapy should not be withdrawn abruptly, but gradually tapered to avoid acute tachycardia and hypertension.

Index Terms Acebutolol Hydrochloride

Jump To Field (Select Field Name)

Medication Safety IssuesInterferes with hepatic synthesis of vitamin K-dependent coagulation factors (II, VII, IX, X)

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(a see no KOOM a rol)

Canadian Brand NamesSintrom®

Pharmacologic CategoryAnticoagulant, Coumarin Derivative

Use: Labeled IndicationsProphylaxis and treatment of venous thrombosis, pulmonary embolism, and thromboembolic disorders; atrial fibrillation with risk of embolism; adjunct in the prophylaxis of coronary occlusion and transient ischemic attacks

Dosing: Adults**Note:** Dosage must be individualized. The following information is based on the manufacturer's labeling in Canada.

Oral: Initial: 8-12 mg on day 1, followed by 4-8 mg on day 2. Subsequent dosage should be based on PT/INR measurements. Usual range of maintenance doses: 1-10 mg/day. Tapering of dosage is recommended prior to discontinuation.

Dosing: ElderlyRefer to adult dosing.

Administration: OralAdminister at the same time each day.

Dietary ConsiderationsFoods high in vitamin K (eg, beef liver, pork liver, green tea, and leafy green vegetables) inhibit anticoagulant effect. Do not change dietary habits once stabilized on acenocoumarol therapy. A balanced diet with a consistent intake of vitamin K is essential. Avoid large amounts of alfalfa, asparagus, broccoli, Brussels sprouts, cabbage, cauliflower, green teas, kale, lettuce, spinach, turnip greens, watercress; these decrease efficacy of oral anticoagulants. It is recommended that the diet contain a CONSISTENT vitamin K content of 70-140 mcg/day. Check with healthcare provider before changing diet. Avoid using multivitamins that contain vitamin K.

Storage Store at 20°C to 25°C (68°F to 77°F).

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to acenocoumarol or any component of the formulation; hemorrhagic tendencies; hemophilia; thrombocytopenia purpura; leukemia; recent or potential surgery of the eye or CNS; major regional lumbar block anesthesia or surgery resulting in large, open surfaces; bleeding from the GI, respiratory, or GU tract; threatened abortion; aneurysm; prolonged dietary insufficiencies (vitamin K deficiency); ascorbic acid deficiency; history of bleeding diathesis; prostatectomy; continuous tube drainage of the small intestine; polyarthritis; diverticulitis; emaciation; malnutrition; cerebrovascular hemorrhage; eclampsia/pre-eclampsia; blood dyscrasias; severe uncontrolled or malignant hypertension; severe hepatic disease; pericarditis or pericardial effusion; subacute bacterial endocarditis; visceral carcinoma; following spinal puncture and other diagnostic or therapeutic procedures with potential for significant bleeding; history of warfarin-induced necrosis; an unreliable, noncompliant patient; alcoholism; patient who has a history of falls or is a significant fall risk; pregnancy

Allergy Considerations

- Coumarin-Type Anticoagulant Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity: May cause hypersensitivity reactions, including anaphylaxis; use with caution in patients with anaphylactic disorders.
- Bleeding: May cause major or fatal bleeding. Risk factors for bleeding include high intensity anticoagulation (INR >4), age (>65 years), variable INRs, history of GI bleeding, hypertension, cerebrovascular disease, serious heart disease, anemia, severe diabetes, malignancy, trauma, renal insufficiency, polycythemia vera, vasculitis, open wound, history of PUD, indwelling catheters, menstruating and postpartum women, drug-drug interactions and long duration of therapy. Patient must be instructed to report bleeding, accidents, or falls as well as any new or discontinued medications, herbal or alternative products used, significant changes in smoking or dietary habits.
- Skin necrosis/gangrene: Necrosis or gangrene of the skin and other tissues can occur (rarely) due to early hypercoagulability; risk is increased in patients with protein C deficiency. "Purple toe” syndrome, due to cholesterol microembolization, has been described with coumarin-type anticoagulants.

Disease-related concerns:

- Infection: Use with caution in patients with acute infection or active TB; antibiotics and fever may alter response to acenocoumarol.
- Renal impairment: Use with caution in patients with renal impairment.
- Thyroid disease: Use with caution in patients with thyroid disease.

Special populations:

- Elderly: The elderly may be more sensitive to anticoagulant therapy.

- Ovulating women: May be at risk of developing ovarian hemorrhage at the time of ovulation.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Patient selection: Use care in the selection of patients appropriate for this treatment; ensure patient cooperation especially from the alcoholic, illicit drug user, demented, or psychotic patient.

Pregnancy ConsiderationsOral anticoagulants cross the placenta and produce fetal abnormalities. Fatal hemorrhage in the fetus has been reported even when the mother's acenocoumarol levels were in the therapeutic range. Acenocoumarol should not be used during pregnancy because of significant risks. Adjusted-dose heparin can be given safely throughout pregnancy in patients with venous thromboembolism. Women of childbearing potential are advised to use effective contraception during treatment.

LactationEnters breast milk/not recommended (per manufacturer)

Adverse ReactionsAs with all anticoagulants, bleeding is the major adverse effect of acenocoumarol. Hemorrhage may occur at virtually any site. Risk is dependent on multiple variables, including the intensity of anticoagulation and patient susceptibility.

Frequency not defined.

Cardiovascular: Hemorrhagic shock

Central nervous system: Fever, headache, stroke (hemorrhagic)

Dermatologic: Rash, urticaria, skin necrosis

Skin necrosis/gangrene, due to paradoxical local thrombosis, is a known but rare risk of oral anticoagulant therapy. Its onset is usually within the first few days of therapy and is frequently localized to the limbs, breast, or penis. The risk of this effect is increased in patients with protein C or S deficiency.

Additional adverse reactions associated with warfarin, but likely to also occur with indanediones, include priapism and skin necrosis ("purple toe" syndrome or cutaneous gangrene).

Gastrointestinal: Gastrointestinal bleeding, melena

Genitourinary: Hematuria

Hematologic: Hemorrhage, retroperitoneal hematoma, unrecognized bleeding sites (eg, colon cancer) may be uncovered by anticoagulation. Other hematologic reactions reported with coumarin derivatives include agranulocytosis, red cell aplasia, anemia, thrombocytopenia, eosinophilia.

Hepatic: Hepatitis, hepatotoxicity, hematobilia

Ocular: Ocular hemorrhage

Respiratory: Epistaxis, hemoptysis, pulmonary hemorrhage

Miscellaneous: Hypersensitivity/allergic reactions

Metabolism/Transport Effects**Substrate** of CYP1A2 (major), 2C9 (major), 2C19 (minor)

Drug Interactions

Acetaminophen: May enhance the anticoagulant effect of Vitamin K Antagonists. Most likely with daily acetaminophen doses >1.3 g for >1 week. *Risk C: Monitor therapy*

Allopurinol: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Aminoglutethimide: May increase the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Amiodarone: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Androgens: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Anticoagulants: May enhance the anticoagulant effect of other Anticoagulants. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Antineoplastic Agents: May enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. **Exceptions:** Alitretinoin; Altretamine; Aminoglutethimide; Anastrozole; Asparaginase; AzaCITIDine; Bleomycin; Capecitabine; CARBOplatin; Carmustine; Chlorambucil; CISplatin; Cladribine; Cytarabine; Cytarabine (Liposomal); Dacarbazine; DACTINomycin; DAUNOrubicin Citrate (Liposomal); DAUNOrubicin Hydrochloride; Denileukin Diftitox; Docetaxel; DOXOrubicin (Liposomal); Epirubicin; Estramustine; Etoposide Phosphate; Exemestane; Fludarabine; Goserelin; Hydroxyurea; IDArubicin; Irinotecan; Letrozole; Leuprolide; Lomustine; Mechlorethamine; Megestrol; Mitomycin; Mitoxantrone; Nilutamide; Paclitaxel; Pegaspargase; Pentostatin; Polyestradiol; Porfimer; RiTUXimab; Streptozocin; Tamoxifen; Temozolomide; Teniposide; Thioguanine; Thiotepa; Topotecan; Toremifene; Tretinoin (Oral); Valrubicin; VinBLAStine; Vinorelbine. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antithyroid Agents: May diminish the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

AzaTHIOprine: May diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Bile Acid Sequestrants: May decrease the absorption of Vitamin K Antagonists. *Risk C: Monitor therapy*

Bosentan: May increase the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Capecitabine: May increase the serum concentration of Vitamin K Antagonists. *Risk D: Consider therapy modification*

CarBAMazepine: May decrease the serum concentration of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Cephalosporins: May enhance the anticoagulant effect of Vitamin K Antagonists. **Exceptions:** Cefaclor; Cefadroxil; Cefdinir; Cefepime; Cefixime; Cefonicid; Cefotaxime; Cefpodoxime; Cefprozil; Ceftazidime; Ceftibuten; Ceftizoxime; Ceftobiprole; Cefuroxime; Cephalexin; Cephradine [Off Market]. *Risk C: Monitor therapy*

Cimetidine: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Coenzyme Q-10: May diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Contraceptive (Progestins): May diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP2C9 Inducers (Highly Effective): May increase the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Moderate): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C9 Inhibitors (Strong): May decrease the metabolism of CYP2C9 Substrates (High risk). *Risk D: Consider therapy modification*

Dasatinib: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Dicloxacillin: May diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Disulfiram: May increase the serum concentration of Vitamin K Antagonists. *Risk C: Monitor therapy*

Drotrecogin Alfa: Vitamin K Antagonists may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Efavirenz: May increase the serum concentration of Vitamin K Antagonists. *Risk C: Monitor therapy*

Etoposide: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Fenugreek: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Fibric Acid Derivatives: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Fluconazole: May decrease the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Fluorouracil: May increase the serum concentration of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Gefitinib: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ginkgo Biloba: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Glucagon: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Glutethimide: May increase the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Griseofulvin: May increase the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Anticoagulants. Bleeding may occur. *Risk D: Consider therapy modification*

HMG-CoA Reductase Inhibitors: May enhance the anticoagulant effect of Vitamin K Antagonists. **Exceptions:** Atorvastatin. *Risk C: Monitor therapy*

Ifosfamide: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ivermectin: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Leflunomide: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Vitamin K Antagonists. **Exceptions:** Dirithromycin [Off Market]; Spiramycin. *Risk C: Monitor therapy*

Mercaptopurine: May diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

MetroNIDAZOLE: May decrease the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Nafcillin: May diminish the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

NSAID (Nonselective): May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): May diminish the anticoagulant effect of Vitamin K Antagonists. In contrast, enhanced anticoagulant effects have also been noted with some products. *Risk D: Consider therapy modification*

Pentosan Polysulfate Sodium: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Phenytoin: May enhance the anticoagulant effect of Vitamin K Antagonists. Vitamin K Antagonists may increase the serum concentration of Phenytoin. *Risk D: Consider therapy modification*

Phytonadione: May diminish the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Propafenone: May increase the serum concentration of Vitamin K Antagonists. *Risk C: Monitor therapy*

Propoxyphene: May decrease the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the adverse/toxic effect of Anticoagulants. Specifically, the antiplatelet effects of these agents may lead to an increased risk of bleeding with the combination. *Risk C: Monitor therapy*

QuiNIDine: May enhance the anticoagulant effect of Vitamin K Antagonists. Note that the prothrombin time might be unchanged in the face of increased bleeding. *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Salicylates: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

St Johns Wort: May increase the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Sulfinpyrazone [Off Market]: May decrease the metabolism of Vitamin K Antagonists. Sulfinpyrazone [Off Market] may decrease the protein binding of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Sulfonamide Derivatives: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Tamoxifen: May increase the serum concentration of Vitamin K Antagonists. *Risk X: Avoid combination*

Tetracycline Derivatives: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Thrombolytic Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Thyroid Products: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Vitamin A: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Vitamin E: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Vorinostat: May enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Zafirlukast: May decrease the metabolism of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol. Acute ethanol ingestion (binge drinking) decreases the metabolism of oral anticoagulants and increases PT/INR. Chronic daily ethanol use increases the metabolism of oral anticoagulants and decreases PT/INR.

Food: The anticoagulant effects of acenocoumarol may be decreased if taken with foods rich in vitamin K. Vitamin E may increase anticoagulant effect.

Herb/Nutraceutical: St John's wort may decrease oral anticoagulant levels. Alfalfa contains large amounts of vitamin K as do many enteral products. Coenzyme Q_{10} may decrease response to oral anticoagulants. Avoid cat's claw, dong quai, evening primrose, feverfew, red clover, horse chestnut, garlic, green tea, ginseng, and ginkgo (all have additional antiplatelet activity).

Monitoring ParametersPT/INR; hepatic function, CBC, urinalysis (for albuminuria/proteinuria)
Monitoring: Lab TestsPT/INR; hepatic function, CBC, urinalysis (for albuminuria/proteinuria)
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Tablet:

Sintrom® [CAN]: 1 mg, 4 mg [not available in the U.S.]

Generic AvailableNo
ManufacturerPendopharm (Canada)
Mechanism of ActionInterferes with hepatic synthesis of vitamin K-dependent coagulation factors (II, VII, IX, X)
Pharmacodynamics/Kinetics

Onset of action: Peak anticoagulant effect: Oral: 36-48 hours

Absorption: Oral: 60%

Protein binding: 99%

Metabolism: Hepatic, via oxidation (possibly by CYP1A2, 2C9, and 2C19) to inactive metabolites

Half-life elimination: 8-11 hours

Time to peak, plasma: 1-3 hours

Excretion: Urine (60%) and feces (29%) as metabolites

Pharmacotherapy PearlsA variety of algorithms and computer-assisted dosing regimens have been reported. Sensitivity to the anticoagulant effect of acenocoumarol has been associated with genetic variations in CYP2C9.

Dental Health: Effects on Dental TreatmentSigns of acenocoumarol overdose may first appear as bleeding from gingival tissue; consultation with physician is advisable prior to surgery to determine temporary dose reduction or withdrawal of medication.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentCarbamazepine may decrease the effects of acenocoumarol; SSRIs may enhance the anticoagulant effects of acenocoumarol

Index TermsAcenocoumarin; Nicoumalone

International Brand NamesAcenocoumarol (PL); Acenocumarol (PL); Acenox (CN); Acitrom (IN); Neo-Sintrom (CN); Sinthrome (GB); Sintrom (AR, BE, BG, CH, FR, GR, IL, IT, MX, NL, PL, PY); Syncumar (PL)

Acetaminophen and Pamabrom

Lexi-Drugs Online

Jump To Field (Select Field Name)

Medication Safety Issues

Duplicate therapy issues: This product contains acetaminophen, which may be a component of other combination products. Do not exceed the maximum recommended daily dose of acetaminophen.

Pronunciation

(a seet a MIN oh fen & PAM a brom)

U.S. Brand NamesCramp Tabs [OTC]; Midol Teen Formula [OTC]; Tylenol® Women's Menstrual Relief [OTC]

Pharmacologic CategoryAnalgesic, Miscellaneous; Diuretic, Combination

Use: Labeled IndicationsTemporary relief of symptoms associated with premenstrual and menstrual symptoms (eg, cramps, bloating, water-weight gain, headache, backache, muscle aches)

Dosing: Adults**Menstrual symptoms:** Oral: Acetaminophen 650-1000 mg and pamabrom 50 mg every 4-6 hours as needed (maximum: 8 caplets/tablets/24 hours)

Dosing: PediatricChildren ≥12 years: Refer to adult dosing.

StorageStore at room temperature 15°C to 25°C (59°F to 77°F); avoid excessive heat.

Warnings/Precautions

Concerns related to adverse effects:

- Hepatotoxicity: Acetaminophen may cause hepatic toxicity with acute overdose; in addition chronic daily dosing has resulted in liver damage in some adults.

- Hypersensitivity: Discontinue use if hypersensitivity occurs.

Disease-related concerns:

- Ethanol use: Use with caution in patients with alcoholic liver disease; consuming ≥3 alcoholic drinks/day may increase the risk of liver damage.

Special populations:

- Pediatrics: Not for use in children <12 years of age.

Other warnings/precautions:

- Dosage limit: Limit acetaminophen dose to <4 g/day in adults.

- Self-medication (OTC use): Should not be used with other products containing acetaminophen. Patients should be instructed to contact healthcare provider if new symptoms occur, if redness or swelling occurs, or pain lasting >10 days.

Adverse ReactionsSee Acetaminophen monograph.

Drug Interactions

Anticonvulsants (Hydantoin): May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Cholestyramine Resin: May decrease the absorption of Acetaminophen. Effect is minimal if cholestyramine is administered 1 hour after acetaminophen. *Risk D: Consider therapy modification*

Imatinib: May increase the serum concentration of Acetaminophen. *Risk D: Consider therapy modification*

Isoniazid: May enhance the adverse/toxic effect of Acetaminophen. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Acetaminophen may enhance the anticoagulant effect of Vitamin K Antagonists. Most likely with daily acetaminophen doses >1.3 g for >1 week. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Excessive intake of ethanol may increase the risk of acetaminophen-induced hepatotoxicity. Avoid ethanol or limit to <3 drinks/day.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Caplet:

Midol Teen Formula: Acetaminophen 500 mg and pamabrom 25 mg

Tylenol® Women’s Menstrual Relief: Acetaminophen 500 mg and pamabrom 25 mg

Tablet:

Cramp Tabs: Acetaminophen 325 mg and pamabrom 25 mg

Generic AvailableYes

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentBarbiturates, carbamazepine, and phenytoin may increase the metabolism of acetaminophen diminishing its effect and increasing the risk of liver damage; monitor.

Medication Safety Issues

Sound-alike/look-alike issues:

Excedrin® may be confused with Dexatrim®, Dexedrine®

Duplicate therapy issues: This product contains acetaminophen, which may be a component of other combination products. Do not exceed the maximum recommended daily dose of acetaminophen.

Pronunciation(a seet a MIN oh fen, AS pir in, & KAF een)

U.S. Brand NamesExcedrin® Extra Strength [OTC]; Excedrin® Migraine [OTC]; Fem-Prin® [OTC]; Genaced™ [OTC]; Goody's® Extra Strength Headache Powder [OTC]; Goody's® Extra Strength Pain Relief [OTC]; Pain-Off [OTC]; Vanquish® Extra Strength Pain Reliever [OTC]

Pharmacologic CategoryAnalgesic, Miscellaneous

Use: Labeled IndicationsRelief of mild-to-moderate pain; mild-to-moderate pain associated with migraine headache

Dosing: Adults

Pain management:

Based on **acetaminophen** component:

Mild-to-moderate pain: Oral: 325-650 mg every 4-6 hours as needed; do **not** exceed 4 g/day

Mild-to-moderate pain associated with migraine headache: Oral: 500 mg/dose (in combination with 500 mg aspirin and 130 mg caffeine) every 6 hours while symptoms persist; do not use for longer than 48 hours

Based on **aspirin** component:

Mild-to-moderate pain: Oral: 325-650 mg every 4-6 hours as needed; do **not** exceed 4 g/day

Mild-to-moderate pain associated with migraine headache: Oral: 500 mg/dose (in combination with 500 mg acetaminophen and 130 mg caffeine) every 6 hours; do not use for longer than 48 hours

Product labeling:

Excedrin® Extra Strength, Excedrin® Migraine: Oral: 2 doses every 6 hours (maximum: 8 doses/24 hours)

Note: When used for migraine, do not use for longer than 48 hours

Goody's® Extra Strength Headache Powder: Oral: 1 powder, placed on tongue or dissolved in water, every 4-6 hours (maximum: 4 powders/24 hours)

Goody's® Extra Strength Pain Relief Tablets: Oral: 2 tablets every 4-6 hours (maximum: 8 tablets/24 hours)

Vanquish® Extra Strength Pain Reliever: Oral: 2 tablets every 4 hours (maximum: 12 tablets/24 hours)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Product labeling:

Excedrin® Extra Strength, Excedrin® Migraine: Oral: Children >12 years: Refer to adult dosing

Goody's® Extra Strength Headache Powder: Oral: Children >12 years: Refer to adult dosing

Goody's® Extra Strength Pain Relief Tablets: Oral: Children >12 years: Refer to adult dosing

Vanquish® Extra Strength Pain Reliever: Oral: Children >12 years: Refer to adult dosing

Dosing: Hepatic ImpairmentUse with caution. Limited, low-dose therapy usually well tolerated in hepatic disease/cirrhosis. However, cases of hepatotoxicity at daily acetaminophen dosages <4 g/day have been reported. Avoid chronic use in hepatic impairment.

ContraindicationsHypersensitivity to acetaminophen, aspirin, salicylates, caffeine, or any component of the formulation; pregnancy

Allergy Considerations

- Acetaminophen Allergy/Hypersensitivity
- Salicylate Allergy/Sensitivity

Pregnancy Risk FactorD

Adverse ReactionsSee individual agents.

Metabolism/Transport Effects

Acetaminophen: **Substrate** (minor) of CYP1A2, 2A6, 2C9, 2D6, 2E1, 3A4; **Inhibits** CYP3A4 (weak)

Aspirin: **Substrate** (minor) of CYP2C9

Caffeine: **Substrate** of CYP1A2 (major), 2C9 (minor), 2D6 (minor), 2E1 (minor), 3A4 (minor); **Inhibits** CYP1A2 (weak), 3A4 (moderate)

Drug Interactions

ACE Inhibitors: Salicylates may diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Alendronate: Aspirin may enhance the adverse/toxic effect of Alendronate. Specifically gastrointestinal adverse events. *Risk C: Monitor therapy*

Anticoagulants: Salicylates may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Antidepressants (Tricyclic, Tertiary Amine): May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the anticoagulant effect of Salicylates. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: Salicylates may enhance the adverse/toxic effect of Carbonic Anhydrase Inhibitors. Salicylate toxicity might be enhanced by this same combination. *Risk D: Consider therapy modification*

Cholestyramine Resin: May decrease the absorption of Acetaminophen. Effect is minimal if cholestyramine is administered 1 hour after acetaminophen. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Salicylates may enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Drotrecogin Alfa: Salicylates may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Ginkgo Biloba: May enhance the antiplatelet effect of Salicylates. *Risk D: Consider therapy modification*

Heparin: Aspirin may enhance the anticoagulant effect of Heparin. *Risk C: Monitor therapy*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Imatinib: May increase the serum concentration of Acetaminophen. *Risk D: Consider therapy modification*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Isoniazid: May enhance the adverse/toxic effect of Acetaminophen. *Risk C: Monitor therapy*

Ketorolac: May enhance the adverse/toxic effect of Aspirin. *Risk X: Avoid combination*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Methotrexate: Salicylates may increase the serum concentration of Methotrexate. Salicylate doses used for prophylaxis of cardiovascular events are not likely to be of concern. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

NSAID (Nonselective): May enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Diclofenac. *Risk D: Consider therapy modification*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Quinolone Antibiotics: May decrease the metabolism of Caffeine. **Exceptions:** Gatifloxacin; Gemifloxacin; Levofloxacin; Lomefloxacin; Moxifloxacin; Nalidixic Acid; Ofloxacin; Sparfloxacin; Trovafloxacin. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Regadenoson: Caffeine may diminish the vasodilatory effect of Regadenoson. *Risk D: Consider therapy modification*

Salicylates: May enhance the anticoagulant effect of other Salicylates. *Risk C: Monitor therapy*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: May enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Sulfonylureas: Salicylates may enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Thrombolytic Agents: Salicylates may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Tiludronate: Aspirin may decrease the serum concentration of Tiludronate. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk C: Monitor therapy*

Uricosuric Agents: Salicylates may diminish the therapeutic effect of Uricosuric Agents. Specifically, uricosuria. *Risk C: Monitor therapy*

Valproic Acid: Salicylates may increase the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Varicella Virus-Containing Vaccines: Salicylates may enhance the adverse/toxic effect of Varicella Virus-Containing Vaccines. Reye's Syndrome may develop. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Salicylates may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Acetaminophen may enhance the anticoagulant effect of Vitamin K Antagonists. Most likely with daily acetaminophen doses >1.3 g for >1 week. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Excessive intake of ethanol may increase the risk of acetaminophen-induced hepatotoxicity. Avoid ethanol or limit to <3 drinks/day.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Caplet:

Excedrin® Extra Strength, Excedrin® Migraine: Acetaminophen 250 mg, aspirin 250 mg, and caffeine 65 mg

Vanquish® Extra Strength Pain Reliever: Acetaminophen 194 mg, aspirin 227 mg, and caffeine 33 mg

Geltab (Excedrin® Extra Strength, Excedrin® Migraine): Acetaminophen 250 mg, aspirin 250 mg, and caffeine 65 mg

Powder (Goody's® Extra Strength Headache Powder): Acetaminophen 260 mg, aspirin 520 mg, and caffeine 32.5 mg [contains lactose]

Tablet:

Excedrin® Extra Strength, Excedrin® Migraine, Genaced™, Pain-Off: Acetaminophen 250 mg, aspirin 250 mg, and caffeine 65 mg

Fem-Prin®: Acetaminophen 194.4 mg, aspirin 226.8 mg, and caffeine 32.4 mg

Goody's® Extra Strength Pain Relief: Acetaminophen 130 mg, aspirin 260 mg, and caffeine 16.25 mg

Generic AvailableYes

Dental Health Professional ConsiderationsThere is no scientific evidence to warrant discontinuance of aspirin prior to dental surgery. Patients taking one aspirin tablet daily as an antithrombotic and who require dental surgery should be given special consideration in consultation with the physician before removal of the aspirin relative to prevention of postoperative bleeding.

The Food and Drug Administration (FDA), has issued a letter updating information and considerations regarding the use of ibuprofen (400 mg doses) in patients who are taking low dose aspirin (81 mg, immediate release; not enteric coated) for cardioprotection and stroke prevention. Ibuprofen, at these doses, may interfere with aspirin's antiplatelet effect depending upon when it is administered. Patients initiated on aspirin first (for ~1 week) then ibuprofen (400 mg 3 times/day for 10 days) seem to maintain aspirin's platelet effect (Cryer B, 2005). Ibuprofen has the greatest impact on aspirin if administered less than 8 hours before aspirin (Catella-Lawson F, 2001).

Patients may require counseling about the appropriate timing of ibuprofen dosing in relationship to aspirin therapy. With occasional use of ibuprofen, a clinically-significant interaction with aspirin in unlikely. To avoid interference during chronic dosing, a single dose of ibuprofen should be taken 30-120 minutes after aspirin ingestion or at least 8 hours should elapse after ibuprofen dosing before giving aspirin (FDA, 2006; Catella-Lawson F, 2001).

The clinical implications of the interaction are unclear. There have not been any clinical endpoint studies conducted at this time. Avoidance of this interaction is potentially important because aspirin's vascular protection could be decreased or negated.

Other nonselective NSAIDs may have potential for a similar interaction with aspirin. Such has been described with naproxen (Capone ML, 2005). Acetaminophen does not appear to interfere with the antiplatelet effect of aspirin. Other clinical scenarios (use of smaller ibuprofen doses, other aspirin products, other doses of aspirin) have not been evaluated.

Additional information is available at: http://www.fda.gov/cder/drug/infopage/aspirin/default.htm

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Aspirin: As with all drugs which may affect hemostasis, bleeding is associated with aspirin. Hemorrhage may occur at virtually any site; risk is dependent on multiple variables including dosage, concurrent use of multiple agents which alter hemostasis, and patient susceptibility. Many adverse effects of aspirin are dose related, and are rare at low dosages. Other serious reactions are idiosyncratic, related to allergy or individual sensitivity (see Dental Comment).
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause anxiety, insomnia, and excitability
Mental Health: Effects on Psychiatric TreatmentEffects of CNS depressants may be lessened by caffeine component

Medication Safety Issues

Sound-alike/look-alike issues:

Panlor® DC may be confused with Pamelor®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Duplicate therapy issues: This product contains acetaminophen, which may be a component of other combination products. Do not exceed the maximum recommended daily dose of acetaminophen.

Pronunciation(a seet a MIN oh fen, KAF een, & dye hye droe KOE deen)
U.S. Brand NamesPanlor® DC; Panlor® SS; ZerLor™
Pharmacologic CategoryAnalgesic Combination (Opioid)
Use: Labeled IndicationsRelief of moderate to moderately-severe pain
Use: DentalRelief of moderate to moderately-severe dental pain
Dosing: AdultsRelief of pain: Oral:

Panlor® DC: 2 capsules every 4 hours as needed; adjust dose based on severity of pain (maximum dose: 10 capsules/24 hours)

Panlor® SS, ZerLor™: 1 tablet every 4 hours as needed; adjust dose based on severity of pain (maximum dose: 5 tablets/24 hours)

Dosing: ElderlyRefer to adult dosing.
StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F). Protect from moisture.
RestrictionsC-III
ContraindicationsHypersensitivity to acetaminophen, caffeine, dihydrocodeine, codeine, or any component of the formulation; significant respiratory depression (in unmonitored settings); acute or severe bronchial asthma; hypercapnia; paralytic ileus
Allergy Considerations

- Acetaminophen Allergy/Hypersensitivity
- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hepatotoxicity: Acetaminophen may cause severe hepatic toxicity on acute overdose; in addition, chronic daily dosing in adults has resulted in liver damage in some patients.
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene-derivative opioid agonists (hydrocodone, hydromorphone, levorphanol, oxycodone, oxymorphone).

Disease-related concerns:

- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- CNS depression/coma: Use with caution in patients with CNS depression or coma.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Ethanol use: Use with caution in patients with alcoholic liver disease; consuming ≥3 alcoholic drinks/day may increase the risk of liver damage.
- G6PD deficiency: Use with caution in patients with known G6PD deficiency.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with severe hepatic impairment.
- Hypotension: Use with caution in patients with hypotension.

- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.

- Renal impairment: Use with caution in patients with severe renal impairment.

- Respiratory disease: Use with caution in patients with respiratory diseases including asthma, emphysema, and/or COPD.

- Seizure disorder: Use with caution in patients with a history of seizure disorder.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- MAO inhibitors: Use with caution with concurrent use of MAO inhibitors.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Caffeine: May cause CNS and cardiovascular stimulation, as well as GI irritation in high doses. Use with caution in patients with a history of peptic ulcer or GERD; avoid in patients with symptomatic cardiac arrhythmias.

- Dosage limit: Limit total acetaminophen dose to <4 g/day.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted with this combination.
LactationEnters breast milk/not recommended
Breast-Feeding ConsiderationsAcetaminophen and caffeine are both excreted in breast milk. Specific information for dihydrocodeine is not available; however, similar agents (eg, codeine, morphine) are excreted in breast milk.
Adverse ReactionsFrequency not defined. Most common reactions with this combination include:

Central nervous system: Dizziness, drowsiness, lightheadedness, sedation

Dermatologic: Pruritus, skin reactions

Gastrointestinal: Constipation, nausea, vomiting

Metabolism/Transport Effects

Acetaminophen: **Substrate** (minor) of CYP1A2, 2A6, 2C9, 2D6, 2E1, 3A4; **Inhibits** CYP3A4 (weak)

Caffeine: **Substrate** of CYP1A2 (major), 2C9 (minor), 2D6 (minor), 2E1 (minor), 3A4 (minor); **Inhibits** CYP1A2 (weak), 3A4 (moderate)

Dihydrocodeine: **Substrate** of CYP2D6 (minor)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Cholestyramine Resin: May decrease the absorption of Acetaminophen. Effect is minimal if cholestyramine is administered 1 hour after acetaminophen. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Imatinib: May increase the serum concentration of Acetaminophen. *Risk D: Consider therapy modification*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Isoniazid: May enhance the adverse/toxic effect of Acetaminophen. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

QuiNIDine: May diminish the analgesic effect of Dihydrocodeine. *Risk D: Consider therapy modification*

Quinolone Antibiotics: May decrease the metabolism of Caffeine. **Exceptions:** Gatifloxacin; Gemifloxacin; Levofloxacin; Lomefloxacin; Moxifloxacin; Nalidixic Acid; Ofloxacin; Sparfloxacin; Trovafloxacin. *Risk C: Monitor therapy*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Regadenoson: Caffeine may diminish the vasodilatory effect of Regadenoson. *Risk D: Consider therapy modification*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Acetaminophen may enhance the anticoagulant effect of Vitamin K Antagonists. Most likely with daily acetaminophen doses >1.3 g for >1 week. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Excessive intake of ethanol may increase the risk of acetaminophen-induced toxicity. Ethanol may also increase CNS depression.

Dosage Forms

Tablets (Panlor SS)

712.8-60-32 mg (30): $58.99

Mechanism of Action

Acetaminophen inhibits the synthesis of prostaglandins in the central nervous system and peripherally blocks pain impulse generation; produces antipyresis from inhibition of hypothalamic heat-regulating center.

Caffeine is a CNS stimulant; use with acetaminophen and dihydrocodeine increases the level of analgesia provided by each agent.

Dihydrocodeine binds to opiate receptors in the CNS, causing inhibition of ascending pain pathways, altering the perception of and response to pain; produces generalized CNS depression.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness or drowsiness

Mental Health: Effects on Psychiatric TreatmentMay cause nausea and vomiting; combined use with SSRIs, acetylcholinesterase inhibitors, aripiprazole, or ziprasidone may produce additive effects. The effects of benzodiazepines, mirtazapine, nefazodone, and venlafaxine may be enhanced by caffeine (CYP3A4 inhibitor). Use with chlorpromazine, fluoxetine, paroxetine, pergolide, or ropinirole may decrease the effects of dihydrocodeine. Fluvoxamine may increase the effects of caffeine. Reduce caffeine consumption by 50% or choose an alternative SSRI. Barbiturates, carbamazepine, and excessive intake of ethanol may decrease the effectiveness, as well as increase the hepatotoxic potential of acetaminophen. Combined use with psychotropics may produce additive sedative effects.

Index TermsCaffeine, Dihydrocodeine, and Acetaminophen; Dihydrocodeine Bitartrate, Acetaminophen, and Caffeine

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

Medication Safety Issues

Sound-alike/look-alike issues:

Thera-Flu® may be confused with Tamiflu®, Thera-Flur-N®

Tylenol® may be confused with atenolol, timolol, Tuinal®, Tylox®

Duplicate therapy issues: This product contains acetaminophen, which may be a component of other combination products. Do not exceed the maximum recommended daily dose of acetaminophen.

Pronunciation(a seet a MIN oh fen, klor fen IR a meen, & soo doe e FED rin)

U.S. Brand NamesActifed® Cold and Sinus [OTC]; Comtrex® Flu Therapy Nighttime [OTC]; Drinex [OTC]; Kolephrin® [OTC]; Sinutab® Sinus Allergy Maximum Strength [OTC]; Tylenol® Children’s Plus Cold Nighttime [OTC] [DSC]

Canadian Brand NamesSinutab® Sinus & Allergy; Tylenol® Allergy Sinus

Pharmacologic CategoryAlpha/Beta Agonist; Analgesic, Miscellaneous; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsTemporary relief of sinus symptoms

Dosing: Adults

Pain (Analgesic): Oral: Based on acetaminophen component: 325-650 mg every 4-6 hours as needed; do **not** exceed 4 g/day

Rhinitis (Antihistamine): Oral: Based on chlorpheniramine maleate component: 4 mg every 4-6 hours (maximum: 24 mg/24 hours)

Nasal congestion (Decongestant): Oral: Based on pseudoephedrine component: 60 mg every 4 hours (maximum: 360 mg/24 hours)

Product labeling:

Sinutab® Sinus Allergy Maximum Strength: Oral: 2 tablets/caplets every 6 hours (maximum: 8 doses/24 hours)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Analgesic: Oral: Based on acetaminophen component: 10-15 mg/kg/dose every 4-6 hours as needed; do **not** exceed 5 doses in 24 hours.

Antihistamine: Oral: Based on chlorpheniramine maleate component:

2-6 years: 1 mg every 4-6 hours (maximum: 6 mg/24 hours)

6-12 years: 2 mg every 4-6 hours (maximum: 12 mg/24 hours)

Children >12 years: Refer to adult dosing.

Decongestant: Oral: Based on pseudoephedrine component:

2-6 years: 15 mg every 4 hours (maximum: 90 mg/24 hours)

6-12 years: 30 mg every 4 hours (maximum: 180 mg/24 hours)

Children >12 years: Refer to adult dosing.

Product labeling:

Sinutab® Sinus Allergy Maximum Strength: Oral: Children >12 years: Refer to adult dosing.

Dosing: Hepatic ImpairmentUse with caution. Limited, low-dose therapy usually well tolerated in hepatic disease/cirrhosis; however, cases of hepatotoxicity at daily acetaminophen dosages <4 g/day have been reported. Avoid chronic use in hepatic impairment.

Dietary Considerations

Children's Tylenol® Plus Cold contains phenylalanine 6 mg/tablet.

Thera-Flu® Cold and Sore Throat Night Time contains phenylalanine 11 mg/packet.

Allergy Considerations

- Acetaminophen Allergy/Hypersensitivity

Pregnancy Risk FactorB

Adverse ReactionsSee individual agents.

Metabolism/Transport Effects

Acetaminophen: **Substrate** (minor) of CYP1A2, 2A6, 2C9, 2D6, 2E1, 3A4; **Inhibits** CYP3A4 (weak)

Chlorpheniramine: **Substrate** of CYP2D6 (minor), 3A4 (major); **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Cholestyramine Resin: May decrease the absorption of Acetaminophen. Effect is minimal if cholestyramine is administered 1 hour after acetaminophen. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Imatinib: May increase the serum concentration of Acetaminophen. *Risk D: Consider therapy modification*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Isoniazid: May enhance the adverse/toxic effect of Acetaminophen. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Acetaminophen may enhance the anticoagulant effect of Vitamin K Antagonists. Most likely with daily acetaminophen doses >1.3 g for >1 week. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Excessive intake of ethanol may increase the risk of acetaminophen-induced hepatotoxicity. Avoid ethanol or limit to <3 drinks/day.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Caplet: Acetaminophen 325 mg, chlorpheniramine maleate 2 mg, and pseudoephedrine hydrochloride 30 mg

Actifed® Cold and Sinus, Sinutab® Sinus Allergy Maximum Strength: Acetaminophen 500 mg, chlorpheniramine maleate 2 mg, and pseudoephedrine hydrochloride 30 mg

Kolephrin®: Acetaminophen 325 mg, chlorpheniramine maleate 2 mg, and pseudoephedrine hydrochloride 30 mg

Liquid:

Comtrex® Flu Therapy Nighttime: Acetaminophen 100 mg, chlorpheniramine maleate 4 mg, and pseudoephedrine hydrochloride 60 mg per 30 mL (240 mL) [contains alcohol; cherry flavor]

Tylenol® Children's Plus Cold Nighttime: Acetaminophen 160 mg, chlorpheniramine maleate 1 mg, and pseudoephedrine hydrochloride 15 mg per 5 mL (120 mL) [contains sodium benzoate; grape flavor] [DSC]

Tablet:

Drinex: Acetaminophen 650 mg, chlorpheniramine maleate 4 mg, and pseudoephedrine hydrochloride 60 mg

Generic AvailableYes

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Acetaminophen
- Chlorpheniramine
- Pseudoephedrine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment:

Chlorpheniramine: Significant xerostomia with prolonged use (normal salivary flow resumes upon discontinuation).

Pseudoephedrine: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental Status Sedation with chlorpheniramine is countered by the excitability associated with pseudoephedrine; one effect may predominate in any particular patient

Mental Health: Effects on Psychiatric Treatment Usually none; sedative effect of chlorpheniramine may be potentiated by other CNS depressants and MAO inhibitors

Index Terms Acetaminophen, Pseudoephedrine, and Chlorpheniramine; Chlorpheniramine, Acetaminophen, and Pseudoephedrine; Chlorpheniramine, Pseudoephedrine, and Acetaminophen; Pseudoephedrine, Acetaminophen, and Chlorpheniramine; Pseudoephedrine, Chlorpheniramine, and Acetaminophen

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Duplicate therapy issues: This product contains acetaminophen, which may be a component of other combination products. Do not exceed the maximum recommended daily dose of acetaminophen.

Pronunciation(a seet a MIN oh fen, KOE deen, & dox IL a meen)

Canadian Brand NamesMersyndol® With Codeine

Pharmacologic CategoryAnalgesic, Miscellaneous; Analgesic, Opioid; Antitussive; Histamine H_1 Antagonist; Histamine H_1 Antagonist, First Generation

Use: Labeled IndicationsRelief of headache, cold symptoms, neuralgia, and muscular aches/pain

Dosing: AdultsOral: 1-2 tablets every 4 hours as needed; total dose should not exceed 12 tablets in a 24-hour period

Dosing: PediatricRefer to adult dosing.

Dosing: Renal ImpairmentNo dosage adjustment required.

Dosing: Hepatic Impairment

Acetaminophen: Use with caution. Limited, low-dose therapy usually well tolerated in hepatic disease/cirrhosis. However, cases of hepatotoxicity at daily acetaminophen dosages <4 g/day have been reported. Avoid chronic use in hepatic impairment.

Codeine: Dosage adjustment of codeine is probably necessary in hepatic insufficiency; no specific guidelines available.

StorageStore at 20°C to 25°C (68°F to 77°F).

RestrictionsCDSA-1; Not available in U.S.

ContraindicationsHypersensitivity to acetaminophen, codeine, doxylamine, or any component of the formulation; significant respiratory depression (in unmonitored settings); acute or severe bronchial asthma; hypercapnia

Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hepatotoxicity: Acetaminophen may cause severe hepatic toxicity on acute overdose; in addition, chronic daily dosing in adults has resulted in liver damage in some patients.
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene-derivative opioid agonists (hydrocodone, hydromorphone, levorphanol, oxycodone, oxymorphone).

Disease-related concerns:

- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension/hypotension and tachycardia).
- CNS depression/coma: Use with caution in patients with CNS depression or coma.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Ethanol use: Use with caution in patients with alcoholic liver disease; consuming ≥3 alcoholic drinks/day may increase the risk of liver damage.
- G6PD deficiency: Use with caution in patients with known G6PD deficiency.
- Gastrointestinal motility disorders: Use with caution in patients with gastrointestinal motility disorders; avoid in paralytic ileus.
- Glaucoma: Use with caution in patients with angle-closure glaucoma and/or increased intraocular pressure.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.

- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.

- Pyloroduodenal obstruction: Use with caution in patients with pyloroduodenal obstruction (including stenotic peptic ulcer).

- Seizure disorder: Use with caution in patients with a history of seizure disorder.

- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

- Surgical patients: Use with caution in postoperative patients following thoracotomy or laparotomy due to suppression of cough.

Other warnings/precautions:

- Dosage limit: Limit total acetaminophen dose to <4 g/day.

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Should not be used in pregnancy unless the potential benefit to the mother justifies possible harm to the fetus. Refer to Codeine monograph.

LactationNo data available.

Breast-Feeding ConsiderationsDoxylamine may be excreted in breast milk, potentially resulting in sedative effects in nursing infants. Refer to Codeine monograph.

Adverse ReactionsSee individual agents.

Metabolism/Transport Effects

Acetaminophen: **Substrate** (minor) of CYP1A2, 2A6, 2C9, 2D6, 2E1, 3A4; **Inhibits** CYP3A4 (weak)

Codeine: **Substrate** of CYP2D6 (major), 3A4 (minor); **Inhibits** CYP2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Cholestyramine Resin: May decrease the absorption of Acetaminophen. Effect is minimal if cholestyramine is administered 1 hour after acetaminophen. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk D: Consider therapy modification*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Imatinib: May increase the serum concentration of Acetaminophen. *Risk D: Consider therapy modification*

Isoniazid: May enhance the adverse/toxic effect of Acetaminophen. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Somatostatin Analogs: May decrease the metabolism of Codeine. The formation of two major codeine metabolites (morphine and norcodeine) may be impaired by somatostatin analogs. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Acetaminophen may enhance the anticoagulant effect of Vitamin K Antagonists. Most likely with daily acetaminophen doses >1.3 g for >1 week. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Herb/Nutraceutical: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersRelief of pain, respiratory and mental status, blood pressure, bowel function

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Tablet:

Mersyndol® With Codeine [CAN]: Acetaminophen 325 mg, codeine 8 mg, and doxylamine 5 mg [not available in the U.S.]

ManufacturerAventis Pharma Canada

Mechanism of ActionAcetaminophen inhibits the synthesis of prostaglandins in the central nervous system and peripherally blocks pain impulse generation; produces antipyresis from inhibition of hypothalamic heat-regulating center. Codeine binds to opiate receptors in the CNS, causing inhibition of ascending pain pathways, altering the perception of and response to pain; causes cough supression by direct central action in the medulla; produces generalized CNS depression. Doxylamine competes with histamine for H_1-receptor sites on effector cells; blocks chemoreceptor trigger zone, diminishes vestibular stimulation, and depresses labyrinthine function through its central anticholinergic activity.

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Acetaminophen
- Codeine
- Doxylamine

Mental Health: Effects on Mental StatusDrowsiness is common; may cause dizziness, disorientation, euphoria, confusion, insomnia, hallucinations, or depression

Mental Health: Effects on Psychiatric TreatmentConcurrent use with psychotropics may produce additive sedation and anticholinergic effects; conversely, the effects of cholinergic agonists will be ameliorated. Concurrent use with fluoxetine or paroxetine may result in loss of codeine's analgesic effects.

Index TermsCodeine, Doxylamine, and Acetaminophen; Doxylamine Succinate, Codeine Phosphate, and Acetaminophen

Tylenol® With Codeine: Health Canada Issues Warning Concerning Potentially Increased Morphine Levels In Milk of Nursing Mothers - October 9, 2008

Janssen-Ortho Inc, in conjunction with Health Canada, has issued a “Dear Healthcare Professional” letter concerning use of Tylenol® with Codeine (acetaminophen with codeine) products and the risk of elevated morphine levels in the serum and breast milk of nursing women who are ultra-rapid metabolizers of codeine. Consequently, infants of nursing mothers with a certain CYP2D6 (converts codeine to morphine) genotype, may be exposed to potentially dangerous serum levels of morphine as well.

Available data indicates the incidence of this CYP2D6 genotype in the general population varies and is estimated to occur in the following populations as follows: North African, Ethiopian, and Arab (16% to 28%); Chinese, Japanese, and Hispanic (0.5% to 1%); Caucasian (1% to 10%); African American (3%).

When using codeine in nursing women, healthcare providers are urged to prescribe and administer the lowest possible dose for the shortest time necessary to achieve adequate clinical effect. Nursing women should be advised of signs/symptoms of morphine toxicity for themselves (extreme sedation, confusion, shallow breathing) and for their infants (sedation, dyspnea, decreased tone, difficult breastfeeding). The manufacturer will be updating the product labeling to include these new warnings and precautions. A similar warning had previously been released in the U.S. in August 2007.

Additional information can be found at the following websites:

Canada: http://www.hc-sc.gc.ca/dhp-mps/medeff/advisories-avis/prof/_2008/tylenol_codeine_hpc-cps-eng.php

U.S.: http://www.fda.gov/cder/drug/InfoSheets/HCP/codeineHCP.htm

Medication Safety Issues

Sound-alike/look-alike issues:

Capital® may be confused with Capitrol®

Tylenol® may be confused with atenolol, timolol, Tuinal®, Tylox®

T3 is an error-prone abbreviation (mistaken as liothyronine)

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Duplicate therapy issues: This product contains acetaminophen, which may be a component of other combination products. Do not exceed the maximum recommended daily dose of acetaminophen.

Pronunciation(a seet a MIN oh fen & KOE deen)

U.S. Brand NamesCapital® and Codeine; Tylenol® With Codeine

Canadian Brand Namesratio-Emtec; ratio-Lenoltec; Triatec-30; Triatec-8; Triatec-8 Strong; Tylenol Elixir with Codeine; Tylenol No. 1; Tylenol No. 1 Forte; Tylenol No. 2 with Codeine; Tylenol No. 3 with Codeine; Tylenol No. 4 with Codeine

Pharmacologic CategoryAnalgesic, Opioid

Use: Labeled IndicationsRelief of mild-to-moderate pain

Use: DentalTreatment of postoperative pain

Dosing: AdultsDoses should be adjusted according to severity of pain and response of the patient. Adult doses ≥60 mg codeine fail to give commensurate relief of pain but merely prolong analgesia and are associated with an appreciably increased incidence of side effects.

Cough (Antitussive): Oral: Based on codeine (15-30 mg/dose) every 4-6 hours (maximum: 360 mg/24 hours based on codeine component)

Pain (Analgesic): Oral: Based on codeine (30-60 mg/dose) every 4-6 hours (maximum: 4000 mg/24 hours based on acetaminophen component)

1-2 tablets every 4 hours to a maximum of 12 tablets/24 hours

Dosing: ElderlyDoses should be titrated to appropriate analgesic effect.

1 Tylenol® [#3] or 2 Tylenol® [#2] tablets every 4 hours; do **not** exceed 4 g/day acetaminophen.

Dosing: Pediatric

Analgesic: Oral:

Codeine: 0.5-1 mg codeine/kg/dose every 4-6 hours

Acetaminophen: 10-15 mg/kg/dose every 4 hours up to a maximum of 2.6 g/24 hours for children <12 years

3-6 years: 5 mL 3-4 times/day as needed of elixir

7-12 years: 10 mL 3-4 times/day as needed of elixir

Children >12 years: 15 mL every 4 hours as needed of elixir

Dosing: Renal ImpairmentSee individual agents.

Dosing: Hepatic ImpairmentUse with caution. Limited, low-dose therapy is usually well tolerated in hepatic disease/cirrhosis; however, cases of hepatotoxicity at daily acetaminophen dosages <4 g/day have been reported. Avoid chronic use in hepatic impairment.

Dietary ConsiderationsMay be taken with food.

RestrictionsC-III; C-V

Note: In countries outside of the U.S., some formulations of Tylenol® with Codeine (eg, Tylenol® No. 3) include caffeine.

ContraindicationsHypersensitivity to acetaminophen, codeine, or any component of the formulation; significant respiratory depression (in unmonitored settings); acute or severe bronchial asthma; hypercapnia; paralytic ileus

Allergy Considerations

- Acetaminophen Allergy/Hypersensitivity
- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hepatotoxicity: May cause severe hepatic toxicity on acute overdose; in addition, chronic daily dosing in adults has resulted in liver damage in some patients.
- Hypotension: May cause hypotension; use with caution in patients with hypovolemia, cardiovascular disease (including acute MI), or drugs which may exaggerate hypotensive effects (including phenothiazines or general anesthetics).
- Phenanthrene hypersensitivity: Use with caution in patients with hypersensitivity reactions to other phenanthrene-derivative opioid agonists (hydrocodone, hydromorphone, levorphanol, oxycodone, oxymorphone).

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.
- Adrenal insufficiency: Use with caution in patients with adrenal insufficiency, including Addison's disease.
- CNS depression/coma: Use with caution in patients with CNS depression or coma.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.
- Ethanol use: Use with caution in patients with alcoholic liver disease; consuming ≥3 alcoholic drinks/day may increase the risk of liver damage.
- G6PD deficiency: Use with caution in patients with known G6PD deficiency.
- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.
- Hepatic impairment: Use with caution in patients with severe hepatic impairment.
- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.
- Seizure disorder: Use with caution in patients with a history of seizure disorder.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- CYP2D6 "ultra-rapid metabolizers": Use caution in patients with two or more copies of the variant CYP2D6*2 allele; may have extensive conversion to morphine and thus increased opioid-mediated effects.

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.

Dosage form specific issues:

- Metabisulfite: Tablets contain metabisulfite which may cause allergic reactions.

- Non-U.S. formulations: Some non-U.S. formulations (including most Canadian formulations) may contain caffeine as an additional ingredient. Caffeine may cause CNS and cardiovascular stimulation, as well as GI irritation in high doses. Use with caution in patients with a history of peptic ulcer or GERD; avoid in patients with symptomatic cardiac arrhythmias.

Other warnings/precautions:

- Dosage limit: Limit total acetaminophen dose to <4 g/day.

- Withdrawal: Concurrent use of agonist/antagonist analgesics may precipitate withdrawal symptoms and/or reduced analgesic efficacy in patients following prolonged therapy with mu opioid agonists. Abrupt discontinuation following prolonged use may also lead to withdrawal symptoms.

Pregnancy Risk FactorC
Pregnancy ConsiderationsRefer to Codeine monograph.
LactationEnters breast milk/use caution
Breast-Feeding ConsiderationsRefer to Codeine monograph.
Adverse Reactions

>10%:

Central nervous system: Dizziness, lightheadedness, sedation

Gastrointestinal: Nausea, vomiting

Respiratory: Dyspnea

1% to 10%:

Central nervous system: Dysphonia, euphoria

Dermatologic: Pruritus

Gastrointestinal: Abdominal pain, constipation

Miscellaneous: Histamine release

<1%: Antidiuretic hormone release, biliary tract spasm, bradycardia, hypotension, intracranial pressure increased, miosis, palpitation, peripheral vasodilation, physical and psychological dependence, respiratory depression, urinary retention

Metabolism/Transport EffectsAcetaminophen: **Substrate** (minor) of CYP1A2, 2A6, 2C9, 2D6, 2E1, 3A4; **Inhibits** CYP3A4 (weak)
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Cholestyramine Resin: May decrease the absorption of Acetaminophen. Effect is minimal if cholestyramine is administered 1 hour after acetaminophen. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk D: Consider therapy modification*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Imatinib: May increase the serum concentration of Acetaminophen. *Risk D: Consider therapy modification*

Isoniazid: May enhance the adverse/toxic effect of Acetaminophen. *Risk C: Monitor therapy*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Somatostatin Analogs: May decrease the metabolism of Codeine. The formation of two major codeine metabolites (morphine and norcodeine) may be impaired by somatostatin analogs. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Acetaminophen may enhance the anticoagulant effect of Vitamin K Antagonists. Most likely with daily acetaminophen doses >1.3 g for >1 week. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Excessive intake of ethanol may increase the risk of acetaminophen-induced hepatotoxicity. Avoid ethanol or limit to <3 drinks/day.

Monitoring ParametersRelief of pain, respiratory and mental status, blood pressure, bowel function

Nursing: Physical Assessment/MonitoringSee individual agents.

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product; [CAN] = Canadian brand name

Caplet:

ratio-Lenoltec No. 1 [CAN], Tylenol No. 1 [CAN]: Acetaminophen 300 mg, codeine phosphate 8 mg, and caffeine 15 mg [not available in the U.S.]

Tylenol No. 1 Forte [CAN]: Acetaminophen 500 mg, codeine phosphate 8 mg, and caffeine 15 mg [not available in the U.S.]

Elixir, oral [C-V]: Acetaminophen 120 mg and codeine phosphate 12 mg per 5 mL (5 mL, 10 mL, 12.5 mL, 15 mL, 120 mL, 480 mL) [contains alcohol 7%]

Tylenol® with Codeine [DSC]: Acetaminophen 120 mg and codeine phosphate 12 mg per 5 mL (480 mL) [contains alcohol 7%; cherry flavor]

Tylenol Elixir with Codeine [CAN]: Acetaminophen 160 mg and codeine phosphate 8 mg per 5 mL (500 mL) [contains alcohol 7%, sucrose 31%; cherry flavor; not available in the U.S.]

Suspension, oral [C-V] (Capital® and Codeine): Acetaminophen 120 mg and codeine phosphate 12 mg per 5 mL (480 mL) [alcohol free; fruit punch flavor]

Tablet [C-III]: Acetaminophen 300 mg and codeine phosphate 15 mg; acetaminophen 300 mg and codeine phosphate 30 mg; acetaminophen 300 mg and codeine phosphate 60 mg

ratio-Emtec [CAN], Triatec-30 [CAN]: Acetaminophen 300 mg and codeine phosphate 30 mg [not available in the U.S.]

ratio-Lenoltec No. 1 [CAN]: Acetaminophen 300 mg, codeine phosphate 8 mg, and caffeine 15 mg [not available in the U.S.]

ratio-Lenoltec No. 2 [CAN], Tylenol No. 2 with Codeine [CAN]: Acetaminophen 300 mg, codeine phosphate 15 mg, and caffeine 15 mg [not available in the U.S.]

ratio-Lenoltec No. 3 [CAN], Tylenol No. 3 with Codeine [CAN]: Acetaminophen 300 mg, codeine phosphate 30 mg, and caffeine 15 mg [not available in the U.S.]

ratio-Lenoltec No. 4 [CAN], Tylenol No. 4 with Codeine [CAN]: Acetaminophen 300 mg and codeine phosphate 60 mg [not available in the U.S.]

Triatec-8 [CAN]: Acetaminophen 325 mg, codeine phosphate 8 mg, and caffeine 30 mg [not available in the U.S.]

Triatec-8 Strong [CAN]: Acetaminophen 500 mg, codeine phosphate 8 mg, and caffeine 30 mg [not available in the U.S.]

Tylenol® with Codeine No. 3: Acetaminophen 300 mg and codeine phosphate 30 mg [contains sodium metabisulfite]

Tylenol® with Codeine No. 4: Acetaminophen 300 mg and codeine phosphate 60 mg [contains sodium metabisulfite]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (Acetaminophen-Codeine)

120-12 mg/5 mL (118): $8.99

120-12 mg/5 mL (240): $13.99

Tablets (Acetaminophen-Codeine #2)

300-15 mg (30): $7.99

Tablets (Acetaminophen-Codeine #3)

300-30 mg (30): $11.99

Tablets (Acetaminophen-Codeine #4)

300-60 mg (30): $11.99

Tablets (Tylenol/Codeine #3)

300-30 mg (30): $27.99

Tablets (Tylenol/Codeine #4)

300-60 mg (30): $44.93

Mechanism of ActionInhibits the synthesis of prostaglandins in the central nervous system and peripherally blocks pain impulse generation; produces antipyresis from inhibition of hypothalamic heat-regulating center; binds to opiate receptors in the CNS, causing inhibition of ascending pain pathways, altering the perception of and response to pain; causes cough supression by direct central action in the medulla; produces generalized CNS depression. Caffeine (contained in some non-U.S. formulations) is a CNS stimulant; use with acetaminophen and codeine increases the level of analgesia provided by each agent.

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Acetaminophen
- Codeine

Dental Health Professional ConsiderationsCodeine products, as with other narcotic analgesics, are recommended only for acute dosing (ie, 3 days or less). The most common adverse effect you will see in your dental patients from codeine is nausea, followed by sedation and constipation. Codeine has narcotic addiction liability, especially when given long-term. Because of the acetaminophen component, this product should be used with caution in patients with alcoholic liver disease.

A study by Hylek, et al, suggested that the combination of acetaminophen with warfarin (Coumadin®) may cause enhanced anticoagulation. The following recommendations have been made by Hylek, et al, and are supported by an editorial in *JAMA* by Bell.

Dose and duration of acetaminophen should be as low as possible, individualized, and monitored.

The study by Hylek reported that for patients who reported taking the equivalent of at least 4 regular strength (325 mg) tablets for longer than a week, the odds of having an INR >6.0 were increased 10-fold above those not taking acetaminophen. Risk decreased with lower intakes of acetaminophen reaching a background level of risk at a dose of 6 or fewer 325 mg tablets per week.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported (see Dental Comment)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation is common; less commonly, codeine may produce euphoria or dysphoria

Mental Health: Effects on Psychiatric TreatmentCodeine may produce physical and psychological dependence. Antipsychotics, TCAs, MAO inhibitors, barbiturates, benzodiazepines, and anticonvulsants may increase the toxicity of codeine. Barbiturates and carbamazepine may increase the hepatotoxic potential of acetaminophen. Diminution of pain relief may occur with the SSRIs.

Cardiovascular ConsiderationsCodeine may cause constipation which may be problematic in patients with unstable angina, and patients after myocardial infarction. Consider stool softener to reduce the potential for constipation. The hemodynamic responses to valsalva-like maneuvers due to straining may have adverse cardiovascular consequences in patients with critical coronary artery disease.

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

For additional information on the advisory posted in January 2008, refer to the following websites:

http://www.cdc.gov/mmwr/preview/mmwrhtml/mm5601a1.htm, Centers for Disease Control, “Infant Deaths Associated with Cough and Cold Medications - Two States, 2005,” *MMWR Morb Mortal Wkly Rep*, 2007, 56(01):1-4.

Medication Safety Issues

Duplicate therapy issues: This product contains acetaminophen, which may be a component of other combination products. Do not exceed the maximum recommended daily dose of acetaminophen.

Pronunciation(a seet a MIN oh fen, deks troe meth OR fan, & fen il EF rin)

U.S. Brand NamesAlka-Seltzer Plus® Day Cold [OTC]; Little Colds® Multi-Symptom Cold Formula [OTC] [DSC]; Mapap® Multi-Symptom Cold [OTC]; Tylenol® Cold Head Congestion Daytime [OTC]; Tylenol® Cold Multi-Symptom Daytime [OTC]; Tylenol® Plus Infants Cold & Cough [OTC] [DSC]; Vicks® DayQuil® Cold/Flu Multi-Symptom Relief [OTC]

Pharmacologic CategoryAnalgesic, Miscellaneous; Antitussive; Decongestant

Use: Labeled IndicationsTemporary relief of common cold and flu symptoms (eg, pain, fever, cough, congestion)

Dosing: Adults**Product labeling:** Relief of cold and flu symptoms: Oral:

Alka-Seltzer Plus® Day Cold: 2 capsules or 20 mL every 4 hours (maximum: 6 doses/24 hours)

Tylenol® Cold Head Congestion Daytime: 2 caplets every 4 hours (maximum: 6 doses/24 hours)

Tylenol® Cold Multi-Symptom Daytime: 2 caplets/gelcaps or 30 mL every 4 hours (maximum: 6 doses/24 hours)

Vicks® DayQuil® Cold/Flu Multi-Symptom Relief LiquiCaps: 2 capsules every 4 hours (maximum: 6 doses/24 hours)

Vicks® DayQuil® Cold/Flu Multi-Symptom Relief Liquid: 30 mL every 4 hours (maximum: 6 doses/24 hours)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Product labeling:** Relief of cold and flu symptoms: Oral:

Vicks® DayQuil® Cold/Flu Multi-Symptom Relief Liquid:

Children 6-11 years: 15 mL every 4 hours, up to 5 doses/day (maximum: 75 mL/24 hours)

Children ≥12 years: Refer to adult dosing.

Alka-Seltzer Plus® Day Cold, Tylenol® Cold Head Congestion Daytime, Tylenol® Cold Multi-Symptom Daytime, Vicks® DayQuil® Cold/Flu Multi-Symptom Relief LiquiCaps: Children ≥12 years: Refer to adult dosing.

Administration: OralSolid dosage forms should be swallowed whole; do not crush, chew or dissolve. Administer liquid capsule formulations with water.

Dietary Considerations

Alka-Seltzer Plus® Day Cold liquid contains sodium 3 mg per 5 mL.

Tylenol® Cold Multi-Symptom Daytime liquid contains sodium 5 mg per 15 mL.

Vicks® DayQuil® Cold/Flu Multi-Symptom Relief liquid contains sodium 71 mg per 15 mL.

StorageStore at room temperature at 20°C to 25°C (68°F to 77°F). Protect from excessive heat and humidity.

ContraindicationsHypersensitivity to acetaminophen, dextromethorphan, phenylephrine, or any component of the formulation; use of MAO inhibitors within 14 days

Warnings/Precautions

Disease-related concerns:

- Ethanol use: Use with caution in patients with alcoholic liver disease; consuming ≥3 alcoholic drinks/day may increase the risk of liver damage.

- Hepatic impairment: Use caution in patients with hepatic impairment; acetaminophen may cause severe hepatic toxicity with acute overdose.

Special populations:

- Elderly: Use with caution in the elderly; more likely to experience adverse reactions to sympathomimetics.

- Pediatrics: Use with caution in children; do not exceed pediatric dosing recommendations. If no recommendations exist on OTC labeling for patient's age, the product should **not** be administered without the guidance of a physician.

Dosage form specific issues:

- Sodium: Some products may contain sodium; use with caution in sodium restricted patients.

Other warnings/precautions:

- OTC labeling: Patients with hypertension, hyperthyroidism, diabetes mellitus, glaucoma, cardiovascular disease, or prostatic hyperplasia should consult a physician prior to use. Patients with chronic cough (associated with COPD or smoking) and/or productive cough (eg, copious amounts of phlegm) should be evaluated by a healthcare provider prior to use. Products containing acetaminophen are not recommended in patients consuming ≥3 alcoholic beverages/day; consult a physician. If pain, nasal congestion, or cough increases in severity or persists >7 days in adults (or >5 days in children) during use, consult a physician. If redness, swelling, or rash occurs or if fever worsens or persists >3 days during therapy, consult a physician. Do not use in children <2 years of age.

Geriatric ConsiderationsAvoid multicomponent cold products in the elderly. See Warnings/Precautions for individual agents.

Adverse ReactionsSee individual agents.

Metabolism/Transport Effects

Acetaminophen: **Substrate** (minor) of CYP1A2, 2A6, 2C9, 2D6, 2E1, 3A4; **Inhibits** CYP3A4 (weak)

Dextromethorphan: **Substrate** of CYP2B6 (minor), 2C9 (minor), 2C19 (minor), 2D6 (major), 2E1 (minor), 3A4 (minor); **Inhibits** CYP2D6 (weak)

Drug Interactions

Anticonvulsants (Hydantoin): May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Cholestyramine Resin: May decrease the absorption of Acetaminophen. Effect is minimal if cholestyramine is administered 1 hour after acetaminophen. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Imatinib: May increase the serum concentration of Acetaminophen. *Risk D: Consider therapy modification*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Isoniazid: May enhance the adverse/toxic effect of Acetaminophen. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the serotonergic effect of Dextromethorphan. This may cause serotonin syndrome. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

QuiNIDine: May decrease the metabolism of Dextromethorphan. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the adverse/toxic effect of Dextromethorphan. **Exceptions:** Fluvoxamine. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Acetaminophen may enhance the anticoagulant effect of Vitamin K Antagonists. Most likely with daily acetaminophen doses >1.3 g for >1 week. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Excessive intake of ethanol may increase the risk of acetaminophen-induced hepatotoxicity. Avoid ethanol or limit to <3 drinks/day.

Nursing: Physical Assessment/MonitoringSee individual agents for Acetaminophen and Phenylephrine.

Patient EducationSee individual agents for Acetaminophen and Phenylephrine.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Caplet:

Mapap® Multi-Symptom Cold: Acetaminophen 325 mg, dextromethorphan hydrobromide 10 mg, and phenylephrine hydrochloride 5 mg

Tylenol® Cold Head Congestion Daytime: Acetaminophen 325 mg, dextromethorphan hydrobromide 10 mg, and phenylephrine hydrochloride 5 mg [Cool Burst™ flavor]

Tylenol® Cold Multi-Symptom Daytime: Acetaminophen 325 mg, dextromethorphan hydrobromide 10 mg, and phenylephrine hydrochloride 5 mg [Cool Burst™ flavor]

Capsule, liquid gel:

Alka-Seltzer Plus® Day Cold: Acetaminophen 325 mg, dextromethorphan hydrobromide 10 mg, and phenylephrine hydrochloride 5 mg

Capsule, liquicap:

Vicks® DayQuil® Cold/Flu Multi-Symptom Relief: Acetaminophen 325 mg, dextromethorphan hydrobromide 10 mg, and phenylephrine hydrochloride 5 mg

Gelcap:

Tylenol® Cold Multi-Symptom Daytime: Acetaminophen 325 mg, dextromethorphan hydrobromide 10 mg, and phenylephrine hydrochloride 5 mg

Liquid:

Alka-Seltzer Plus® Day Cold: Acetaminophen 162.5 mg, dextromethorphan hydrobromide 5 mg, and phenylephrine hydrochloride 2.5 mg per 5 mL (180 mL) [alcohol free; contains sodium 3 mg/5 mL, propylene glycol, and sodium benzoate; berry flavor]

Tylenol® Cold Multi-Symptom Daytime: Acetaminophen 325 mg, dextromethorphan hydrobromide 10 mg, and phenylephrine hydrochloride 5 mg per 15 mL (240 mL) [contains sodium 5 mg/15 mL, sodium benzoate, and propylene glycol; Citrus Burst™ flavor]

Vicks® DayQuil® Cold/Flu Multi-Symptom Relief: Acetaminophen 325 mg, dextromethorphan hydrobromide 10 mg, and phenylephrine hydrochloride 5 mg per 15 mL (180 mL, 300 mL) [contains sodium 71 mg/15 mL and propylene glycol]

Liquid [drops]:

Little Colds® Multi-Symptom Cold Formula: Acetaminophen 80 mg, dextromethorphan hydrobromide 2.5 mg, and phenylephrine hydrochloride 1.25 mg per 1 mL (15 mL) [alcohol free, dye free; contains propylene glycol and sodium benzoate; berry flavor] [DSC]

Tylenol® Plus Infants Cold & Cough: Acetaminophen 80 mg, dextromethorphan hydrobromide 2.5 mg, and phenylephrine hydrochloride 1.25 mg per 0.8 mL (15 mL) [contains sodium benzoate; cherry flavor] [DSC]

Generic AvailableYes: Caplet

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Tachycardia, palpitations (use vasoconstrictor with caution), and xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since phenylephrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response.

Mental Health: Effects on Mental StatusSedation with dextromethorphan may be countered by the excitability associated with phenylephrine; one effect may predominate in any particular patient

Mental Health: Effects on Psychiatric TreatmentContraindicated with or within 14 days of MAO inhibitor treatment; avoid. Barbiturates and carbamazepine may increase the hepatotoxic potential of acetaminophen.

Index TermsDextromethorphan Hydrobromide, Acetaminophen, and Phenylephrine Hydrochloride; Phenylephrine, Acetaminophen, and Dextromethorphan; Phenylephrine, Dextromethorphan, and Acetaminophen

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Medication Safety Issues

Sound-alike/look-alike issues:

Sudafed® may be confused with Sufenta®

Thera-Flu® may be confused with Tamiflu®, Thera-Flur-N®

Tylenol® may be confused with atenolol, timolol, Tuinal®, Tylox®

Duplicate therapy issues: This product contains acetaminophen, which may be a component of other combination products. Do not exceed the maximum recommended daily dose of acetaminophen.

Pronunciation(a seet a MIN oh fen, deks troe meth OR fan, & soo doe e FED rin)

U.S. Brand NamesTylenol® Cold Day Non-Drowsy [OTC]; Tylenol® Flu Non-Drowsy Maximum Strength [OTC]

Canadian Brand NamesContac® Complete; Contac® Cough, Cold and Flu Day & Night™; Sudafed® Cold & Cough Extra Strength; Tylenol® Cold Daytime

Pharmacologic CategoryAlpha/Beta Agonist; Analgesic, Miscellaneous; Antitussive

Use: Labeled IndicationsTreatment of mild-to-moderate pain and fever; symptomatic relief of cough and congestion

Dosing: Adults

Pain (Analgesic): Oral: Based on acetaminophen component: 325-650 mg every 4-7 hours as needed; do **not** exceed 4 g/day

Cough suppressant (Antitussive): Oral: Based on dextromethorphan component: 10-20 mg every 4-8 hours **or** 30 mg every 8 hours; do **not** exceed 120 mg/24 hours

Nasal congestion (Decongestant): Oral: Based on pseudoephedrine component: 60 mg every 4 hours (maximum: 360 mg/24 hours)

Product labeling:

Tylenol® Cold Non-Drowsy: Oral: 2 doses every 6 hours (maximum: 8 doses/24 hours)

Tylenol® Flu Non-Drowsy Maximum Strength: Oral: 2 doses every 6 hours (maximum: 8 doses/24 hours)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Analgesic: Oral: Based on acetaminophen component: 10-15 mg/kg/dose every 4-6 hours as needed; do **not** exceed 5 doses/24 hours.

Cough suppressant: Oral: Based on dextromethorphan component:

Children 6-12 years: 15 mg every 6-8 hours; do **not** exceed 60 mg/24 hours

Children >12 years: Refer to adult dosing.

Decongestant: Oral: Based on pseudoephedrine component:

Children:

2-6 years: 15 mg every 4 hours (maximum: 90 mg/24 hours)

6-12 years: 30 mg every 4 hours (maximum: 180 mg/24 hours)

Children >12 years: Refer to adult dosing.

Product labeling:

Sudafed® Severe Cold, Thera-Flu® Non-Drowsy Maximum Strength (gelcap), Tylenol® Flu Non-Drowsy Maximum Strength: Oral: Children >12 years: Refer to adult dosing.

Tylenol® Cold Non-Drowsy: Oral:

Children 6-11 years: 1 dose every 6 hours (maximum: 4 doses/24 hours)

Children ≥12 years: Refer to adult dosing.

Thera-Flu® Non-Drowsy Maximum Strength: Oral: Children >12 years: Refer to adult dosing.

Dosing: Hepatic ImpairmentUse with caution. Limited, low-dose therapy usually well tolerated in hepatic disease/cirrhosis; however, cases of hepatotoxicity at daily acetaminophen dosages <4 g/day have been reported. Avoid chronic use in hepatic impairment.

ContraindicationsHypersensitivity to acetaminophen, dextromethorphan, pseudoephedrine, or any component of the formulation

Allergy Considerations

- Acetaminophen Allergy/Hypersensitivity

Adverse ReactionsSee individual agents.

Metabolism/Transport Effects

Acetaminophen: **Substrate** (minor) of CYP1A2, 2A6, 2C9, 2D6, 2E1, 3A4; **Inhibits** CYP3A4 (weak)

Dextromethorphan: **Substrate** of CYP2B6 (minor), 2C9 (minor), 2C19 (minor), 2D6 (major), 2E1 (minor), 3A4 (minor); **Inhibits** CYP2D6 (weak)

Drug Interactions

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Cholestyramine Resin: May decrease the absorption of Acetaminophen. Effect is minimal if cholestyramine is administered 1 hour after acetaminophen. *Risk D: Consider therapy modification*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Imatinib: May increase the serum concentration of Acetaminophen. *Risk D: Consider therapy modification*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Isoniazid: May enhance the adverse/toxic effect of Acetaminophen. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the serotonergic effect of Dextromethorphan. This may cause serotonin syndrome. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

QuiNIDine: May decrease the metabolism of Dextromethorphan. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the adverse/toxic effect of Dextromethorphan. **Exceptions:** Fluvoxamine. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Acetaminophen may enhance the anticoagulant effect of Vitamin K Antagonists. Most likely with daily acetaminophen doses >1.3 g for >1 week. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Excessive intake of ethanol may increase the risk of acetaminophen-induced hepatotoxicity. Avoid ethanol or limit to <3 drinks/day.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Caplet:

Tylenol® Cold Day Non-Drowsy: Acetaminophen 325 mg dextromethorphan hydrobromide 15 mg, and pseudoephedrine hydrochloride 30 mg

Gelcap:

Tylenol® Flu Non-Drowsy Maximum Strength: Acetaminophen 500 mg, dextromethorphan hydrobromide 15 mg, and pseudoephedrine hydrochloride 30 mg

Generic AvailableNo

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Acetaminophen
- Dextromethorphan
- Pseudoephedrine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Pseudoephedrine: Xerostomia (normal salivary flow resumes upon discontinuation)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusSedation with dextromethorphan tends to be countered by the excitability associated with pseudoephedrine; one effect may predominate in any particular patient

Mental Health: Effects on Psychiatric TreatmentIncreased toxicity and hypertensive crisis may be seen with concurrent use of MAO inhibitors and CNS depressants, effects of CNS depressants may be lessened

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Medication Safety Issues

Duplicate therapy issues: This product contains acetaminophen, which may be a component of combination products. Do not exceed the maximum recommended daily dose of acetaminophen.

Pronunciation(a seet a MIN oh fen, dye fen HYE dra meen, & fen il EF rin)

U.S. Brand NamesBenadryl® Allergy and Cold [OTC]; Benadryl® Allergy and Sinus Headache [OTC]; Children’s Tylenol® Plus Cold and Allergy [OTC]; Sudafed PE® Nighttime Cold [OTC]; Sudafed PE® Severe Cold [OTC]; Tylenol® Allergy Multi-Symptom Nighttime [OTC]

Pharmacologic CategoryAnalgesic, Miscellaneous; Decongestant; Histamine H_1 Antagonist

Use: Labeled IndicationsTemporary relief of symptoms of hay fever and the common cold, including: sinus/nasal congestion and pain/pressure, headache, sneezing, runny nose, itchy/watery eyes, sore throat, cough, and minor aches and pains

Dosing: Adults**Hay fever/cold symptoms:** Oral: General dosing guidelines; refer to specific product labeling (Benadryl® Allergy and Cold, Benadryl® Allergy and Sinus Headache, Sudafed PE® Nighttime Cold, Sudafed PE® Severe Cold, Tylenol® Allergy Multi-Symptom Nighttime): Two caplets every 4 hours as needed; maximum: 12 caplets/24 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Hay fever/cold symptoms:** Oral: General dosing guidelines; refer to specific product labeling:

Children 6-11 years (Benadryl® Allergy and Cold, Benadryl® Allergy and Sinus Headache, Sudafed PE® Severe Cold): One caplet every 4 hours as needed; maximum: 5 caplets/24 hours

Children 6-11 years; 48-95 lbs (Children's Tylenol® Plus Cold and Allergy): 10 mL every 4 hours as needed; maximum: 5 doses/24 hours

Children ≥12 years: Refer to adult dosing.

Administration: OralAdminister without regard to meals.

Liquid: Shake well before use. Only use enclosed dosing cup; do not use other devices.

Tylenol® Allergy Multi-Symptom Nighttime: Swallow whole; do not crush, chew, or dissolve.

StorageStore at room temperature. Protect from moisture.

ContraindicationsUse with or within 14 days of MAO inhibitor therapy; concurrent use with other products containing acetaminophen, diphenhydramine (including topical) or phenylephrine

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Ethanol use: Use with caution in patients with alcoholic liver disease; consuming ≥3 alcoholic drinks/day may increase the risk of liver damage.

- Hepatic impairment: Use caution in patients with hepatic impairment; acetaminophen may cause severe hepatic toxicity with acute overdose.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Pediatrics: Use with caution in children; may cause excitability. Do not exceed pediatric dosing recommendations. If no recommendations exist on OTC labeling for patient's age, the product should **not** be administered without the guidance of a physician.

Other warnings/precautions:

- Dosage limit: Limit acetaminophen dose to <4 g/day (adults) or <2.6 g/day (children <12 years of age).

- Self-medication (OTC use): Patients with hypertension, thyroid disease, diabetes mellitus, glaucoma, cardiovascular disease, or prostatic hyperplasia should consult healthcare provider prior to use. Patients with chronic cough (associated with COPD or smoking) and/or productive cough (eg, copious amounts of phlegm) should be evaluated by a healthcare provider prior to use. Products containing acetaminophen are not recommended in patients consuming ≥3 alcoholic beverages/day; consult healthcare provider. If pain, nasal congestion, or cough increases in severity or persists >7 days in adults (or >5 days in children) during use, consult a physician. If redness, swelling, or rash occurs or if fever worsens or persists >3 days during therapy, consult healthcare provider. If sore throat is severe, accompanied by fever, nausea/vomiting, headache, swelling or rash, or last >2 days, discontinue use and consult healthcare provider.

Adverse ReactionsSee individual agents.

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Cholestyramine Resin: May decrease the absorption of Acetaminophen. Effect is minimal if cholestyramine is administered 1 hour after acetaminophen. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

Imatinib: May increase the serum concentration of Acetaminophen. *Risk D: Consider therapy modification*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Isoniazid: May enhance the adverse/toxic effect of Acetaminophen. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Nebivolol: CYP2D6 Inhibitors (Moderate) may increase the serum concentration of Nebivolol. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Acetaminophen may enhance the anticoagulant effect of Vitamin K Antagonists. Most likely with daily acetaminophen doses >1.3 g for >1 week. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Caplet:

Benadryl® Allergy and Cold, Benadryl® Allergy and Sinus Headache, Sudafed PE® Severe Cold: Acetaminophen 325 mg, diphenhydramine hydrochloride 12.5 mg and phenylephrine hydrochloride 5 mg

Sudafed PE® Nighttime Cold: Acetaminophen 325 mg, diphenhydramine hydrochloride 25 mg and phenylephrine hydrochloride 5 mg

Tylenol® Allergy Multi-Symptom Nighttime: Acetaminophen 325 mg, diphenhydramine hydrochloride 25 mg and phenylephrine hydrochloride 5 mg [Cool Burst™ flavor]

Liquid:

Children's Tylenol® Plus Cold and Allergy: Acetaminophen 160 mg, Diphenhydramine 12.5 mg, and phenylephrine 2.5 mg per 5 mL (120 mL) [contains sodium benzoate; bubble gum flavor]

Generic AvailableNo

Mechanism of Action

Acetaminophen inhibits the synthesis of prostaglandins in the central nervous system and peripherally blocks pain impulse generation.

Diphenhydramine is an H_1-receptor antagonist.

Phenylephrine causes vasoconstriction of the arterioles of the nasal mucosa.

Pharmacodynamics/KineticsSee individual agents.

Mental Health: Effects on Mental StatusMay cause drowsiness, anxiety, or restlessness

Mental Health: Effects on Psychiatric TreatmentContraindicated with or within 14 days of MAO inhibitor treatment. May cause CNS depression; concurrent use with psychotropics may produce additive effects. Barbiturates and carbamazepine may increase the hepatotoxic potential of acetaminophen. Individuals consuming ≥3 alcoholic drinks per day may increase the risk of liver damage.

Index TermsAcetaminophen, Phenylephrine, and Diphenhydramine; Diphenhydramine, Phenylephrine Hydrochloride, and Acetaminophen; Phenylephrine Hydrochloride, Acetaminophen, and Diphenhydramine

Medication Safety Issues

Sound-alike/look-alike issues:

Midrin® may be confused with Mydfrin®

Duplicate therapy issues: This product contains acetaminophen, which may be a component of other combination products. Do not exceed the maximum recommended daily dose of acetaminophen.

Pronunciation(a seet a MIN oh fen, eye soe me THEP teen, & dye KLOR al FEN a zone)

U.S. Brand NamesAmidrine [DSC]; Duradrin® [DSC]; Midrin®; Migquin [DSC]; Migratine; Migrazone® [DSC]; Migrin-A [DSC]

Pharmacologic CategoryAnalgesic, Miscellaneous

Use: Labeled IndicationsRelief of migraine and tension headache

Dosing: Adults

Migraine headache: Oral: 2 capsules to start, followed by 1 capsule every hour until relief is obtained (maximum: 5 capsules/12 hours)

Tension headache: Oral: 1-2 capsules every 4 hours (maximum: 8 capsules/24 hours)

Dosing: ElderlyRefer to adult dosing.

Dosing: Hepatic ImpairmentUse with caution. Limited, low-dose therapy usually well tolerated in hepatic disease/cirrhosis; however, cases of hepatotoxicity at daily acetaminophen dosages <4 g/day have been reported. Avoid chronic use in hepatic impairment.

RestrictionsC-IV

ContraindicationsHypersensitivity to acetaminophen, isometheptene, dichloralphenazone, or any component of the formulation; glaucoma; severe renal disease; hypertension; organic heart disease; hepatic disease; MAO inhibitor therapy

Allergy Considerations

- Acetaminophen Allergy/Hypersensitivity

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsAcetaminophen and dichloralphenazone are excreted in breast milk; excretion of isometheptene is not known.

Adverse ReactionsFrequency not defined.

Central nervous system: Transient dizziness

Dermatological: Rash

Metabolism/Transport EffectsAcetaminophen: **Substrate** (minor) of CYP1A2, 2A6, 2C9, 2D6, 2E1, 3A4; **Inhibits** CYP3A4 (weak)

Drug Interactions

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Beta-Blockers: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Epinephrine used as a local anesthetic for dental procedures will not likely cause clinically relevant problems. *Risk D: Consider therapy modification*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

Cholestyramine Resin: May decrease the absorption of Acetaminophen. Effect is minimal if cholestyramine is administered 1 hour after acetaminophen. *Risk D: Consider therapy modification*

Imatinib: May increase the serum concentration of Acetaminophen. *Risk D: Consider therapy modification*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Isoniazid: May enhance the adverse/toxic effect of Acetaminophen. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). Primarily with oral administration of phenylephrine. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Acetaminophen may enhance the anticoagulant effect of Vitamin K Antagonists. Most likely with daily acetaminophen doses >1.3 g for >1 week. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Excessive intake of ethanol may increase the risk of acetaminophen-induced hepatotoxicity. Avoid ethanol or limit to <3 drinks/day.

Nursing: Physical Assessment/MonitoringSee individual agent for Acetaminophen.

Patient EducationSee individual agent for Acetaminophen.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule: Acetaminophen 325 mg, isometheptene mucate 65 mg, dichloralphenazone 100 mg [DSC]

Amidrine [DSC], Duradrin® [DSC], Midrin®, Migquin [DSC], Migrazone® [DSC], Migratine, Migrin-A [DSC]: Acetaminophen 325 mg, isometheptene mucate 65 mg, and dichloralphenazone 100 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Migratine)

325-65-100 mg (100): $37.57

Acetaminophen and Phenylephrine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Duplicate therapy issues: This product contains acetaminophen, which may be a component of combination products. Do not exceed the maximum recommended daily dose of acetaminophen.

Pronunciation(a seet a MIN oh fen & fen il EF rin)

U.S. Brand NamesAlka-Seltzer Plus® Sinus Formula [OTC]; Contac® Cold + Flu Maximum Strength Non-Drowsy [OTC]; Mapap® Sinus Congestion and Pain Daytime [OTC]; Sinutab® Sinus [OTC]; Sudafed PE® Sinus Headache [OTC]; Tylenol® Sinus Congestion & Pain Daytime [OTC]

Pharmacologic CategoryAnalgesic, Miscellaneous; Decongestant

Use: Labeled IndicationsTemporary relief of sinus/nasal congestion and pressure, headache, and minor aches and pains

Dosing: AdultsSinus pain/pressure: Oral: General dosing guidelines, refer to specific product labeling: Acetaminophen 325 mg and phenylephrine 5 mg/caplet: Take 2 caplets every 4 hours as needed; maximum: 12 caplets/24 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren ≥12 years: Refer to adult dosing.

Administration: OralCaplets and gelcaps should be swallowed whole; do not crush, chew, or dissolve. Effervescent tablets should be dissolved in 4 ounces of water.

Dietary ConsiderationsAlka-Seltzer Plus® Sinus Formula contains sodium 477 mg/tablet and phenylalanine 4.2 mg/tablet

ContraindicationsHypersensitivity to acetaminophen, phenylephrine, or any component of the formulation; with or within 14 days of MAO inhibitor therapy

Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease).
- Diabetes: Use with caution in patients with diabetes mellitus.
- Ethanol use: Use with caution in patients with alcoholic liver disease; consuming ≥3 alcoholic drinks/day may increase the risk of liver damage.
- Hepatic impairment: Use caution in patients with hepatic impairment; acetaminophen may cause severe hepatic toxicity with acute overdose.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Special populations:

- Elderly: Use with caution in the elderly; more likely to experience adverse reactions to sympathomimetics.
- Pediatrics: Use with caution in children; do not exceed pediatric dosing recommendations. Not for OTC use in children <12 years of age.

Dosage form specific issues:

- Phenylalanine: Some products may contain phenylalanine.
- Sodium: Some products may contain sodium; use with caution in sodium restricted patients.

Other warnings/precautions:

- Dosage limit: Limit acetaminophen dose to <4 g/day.
- Self-medication (OTC use): When used for self-medication (OTC), notify healthcare provider if symptoms do not improve within 7 days or are accompanied by fever lasting >3 days. Discontinue and contact healthcare provider if nervousness, dizziness, or sleeplessness occur.

Geriatric ConsiderationsElderly are more predisposed to the adverse effects of sympathomimetics since they frequently have cardiovascular disease and diabetes mellitus, and are on multiple medications. Since oral and topical phenylephrine can be obtained OTC, elderly patients should be counseled about their proper use and in what disease states they should be avoided.

Adverse ReactionsSee individual agents.

Metabolism/Transport EffectsAcetaminophen: **Substrate** (minor) of CYP1A2, 2A6, 2C9, 2D6, 2E1, 3A4; **Inhibits** CYP3A4 (weak)

Drug Interactions

Anticonvulsants (Hydantoin): May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Cholestyramine Resin: May decrease the absorption of Acetaminophen. Effect is minimal if cholestyramine is administered 1 hour after acetaminophen. *Risk D: Consider therapy modification*

Imatinib: May increase the serum concentration of Acetaminophen. *Risk D: Consider therapy modification*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Isoniazid: May enhance the adverse/toxic effect of Acetaminophen. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the hypertensive effect of Alpha1-Agonists. *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Acetaminophen may enhance the anticoagulant effect of Vitamin K Antagonists. Most likely with daily acetaminophen doses >1.3 g for >1 week. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Caplet, oral:

Contac® Cold + Flu Maximum Strength Non Drowsy: Acetaminophen 500 mg and phenylephrine hydrochloride 5 mg

Mapap® Sinus Congestion and Pain Daytime, Sinutab® Sinus, Sudafed PE® Sinus Headache: Acetaminophen 325 mg and phenylephrine hydrochloride 5 mg

Tylenol® Sinus Congestion & Pain Daytime: Acetaminophen 325 mg and phenylephrine hydrochloride 5 mg [Cool Burst™ flavor]

Gelcap, oral:

Tylenol® Sinus Congestion & Pain Daytime: Acetaminophen 325 mg and phenylephrine hydrochloride 5 mg

Gelcap, rapid release, oral:

Tylenol® Sinus Congestion & Pain Datyime: Acetaminophen 325 mg and phenylephrine hydrochloride 5 mg

Tablet for solution, oral [effervescent]:

Alka-Seltzer Plus® Sinus Formula: Acetaminophen 250 mg and phenylephrine hydrochloride 5 mg [contains sodium 477 mg/tablet and phenylalanine 4.2 mg/tablet; lemon zest flavor]

Generic AvailableYes: Caplet

Mechanism of ActionAcetaminophen inhibits the synthesis of prostaglandins in the central nervous system and peripherally blocks pain impulse generation. Phenylephrine causes vasoconstriction of the arterioles of the nasal mucosa.

Pharmacodynamics/KineticsSee individual agents.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Tachycardia, palpitations (use vasoconstrictor with caution), and xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since phenylephrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response.

Mental Health: Effects on Mental StatusMay cause anxiety and restlessness

Mental Health: Effects on Psychiatric TreatmentAvoid concurrent use with MAO inhibitors; may result in hypertensive crisis and is contraindicated. Barbiturates and carbamazepine may increase the hepatotoxic potential of acetaminophen. Individuals consuming ≥3 alcoholic drinks/day may increase the risk of liver damage.

Index TermsPhenylephrine Hydrochloride and Acetaminophen

Acetaminophen and Phenyltoloxamine

Medication Safety Issues

Sound-alike/look-alike issues:

Percogesic® may be confused with paregoric, Percodan®

Duplicate therapy issues: This product contains acetaminophen, which may be a component of other combination products. Do not exceed the maximum recommended daily dose of acetaminophen.

Pronunciation(a seet a MIN oh fen & fen il to LOKS a meen)

U.S. Brand NamesAceta-Gesic [OTC]; Alpain; BeFlex; Dologesic®; Flextra 650; Flextra-DS; Genasec™ [OTC]; Hyflex-DS® [DSC]; Lagesic™; Percogesic® [OTC]; Phenagesic [OTC]; Phenylgesic [OTC]; RhinoFlex 650; RhinoFlex™; Staflex; Vistra 650; Zgesic

Pharmacologic CategoryAnalgesic, Miscellaneous

Use: Labeled IndicationsRelief of mild-to-moderate pain

Dosing: Adults

Pain (Analgesic): Oral: Based on acetaminophen component: 325-650 mg every 4-6 hours as needed (maximum: 4 g/day)

Product-specific labeling: Oral:

Dologesic®: 1-2 caplets/capsules **or** 15-30 mL every 4 hours (maximum: 8 caplets/24 hours **or** 120 mL/24 hours)

Flextra-650:$^1/_2$-1 tablet every 6 hours (maximum: 4 tablets/day)

Flextra-DS, RhinoFlex™, RhinoFlex™-650:$^1/_2$-1 tablet every 4 hours (maximum: 5 tablets/day)

Lagesic™, Zgesic: 1-2 caplets/tablets every 8-12 hours (maximum: 6 tablets/24 hours)

Percogesic®: 1-2 tablets every 4 hours (maximum: 8 tablets/24 hours)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Analgesic: Oral:

Based on acetaminophen component: 10-15 mg/kg/dose every 4-6 hours as needed (maximum: 5 doses/24 hours)

Product-specific labeling: Oral:

Dologesic®:

Children <12 years: 1 caplet/capsule **or** 5 mL every 4 hours

Children ≥12 years: Refer to adult dosing

Flextra-650:

Children 6 to <12 years: $^1/_2$ tablet every 6 hours (maximum: 2 tablets/day)

Children ≥12 years: Refer to adults dosing.

Flextra-DS, RhinoFlex™, RhinoFlex™-650:

Children 6 to <12 years: $^1/_2$ tablet every 4 hours (maximum: 2.5 tablets/day)

Children ≥12 years: Refer to adult dosing.

Lagesic™:

Children 6-12 years: $^1/_2$ to 1 caplet every 12 hours (maximum: 2 caplets/day)

Children ≥12 years: Refer to adult dosing

Percogesic®: Children 6-12 years: 1 tablet every 4 hours (maximum: 4 tablets/24 hours)

Zgesic: Children >12 years: Refer to adult dosing

Dosing: Renal Impairment

Specific dosing adjustment not available. Monitor renal function with severe impairment.

Dosing: Hepatic Impairment Use with caution. Limited, low-dose therapy is usually well tolerated in hepatic disease/cirrhosis; however, cases of hepatotoxicity at daily acetaminophen dosages <4 g/day have been reported. Avoid chronic use in hepatic impairment.

Administration: Oral May be administered with food or milk.

Extended release caplet (Lagesic™): Caplet may be broken in half; do not chew or crush.

Prolonged release tablet (Zgesic): Swallow whole; do not chew or crush. May be taken with food or milk.

Dietary Considerations May be taken with food or milk.

StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Avoid excessive heat.

ContraindicationsHypersensitivity to acetaminophen, phenyltoloxamine, or any component of the formulation

Allergy Considerations

- Acetaminophen Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hepatotoxicity: May cause severe hepatic toxicity on acute overdose; in addition, chronic daily dosing in adults has resulted in liver damage in some patients.

Disease-related concerns:

- Ethanol use: Use with caution in patients with alcoholic liver disease; consuming ≥3 alcoholic drinks/day may increase the risk of liver damage.
- G6PD deficiency: Use with caution in patients with known G6PD deficiency.
- Glaucoma: Use with caution in patients with glaucoma.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Prostatic hyperplasia/urinary stricture: Use with caution in patients with prostatic hyperplasia and/or urinary stricture.
- Renal impairment: Use with caution in patients with renal impairment.
- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function; critical respiratory depression may occur, even at therapeutic dosages.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Safety and efficacy have not been established in children <6 years of age.

Other warnings/precautions:

- Dosage limit: Limit acetaminophen dose to <4 g/day.
- Self-medication (OTC use): When used for self-medication, patients should be instructed to contact healthcare provider if used for fever lasting >3 days or for pain lasting >10 days in adults or >5 days in children.

Pregnancy Risk FactorC

Pregnancy Considerations Reproduction studies have not been conducted with this combination.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding Considerations Acetaminophen is excreted in breast milk. Excretion of phenyltoloxamine is not known.

Adverse Reactions Frequency not defined.

Central nervous system: Dizziness, drowsiness, lassitude

Dermatologic: Pruritus, rash

Gastrointestinal: Nausea

Ocular: Blurred vision

Miscellaneous: Diaphoresis

Metabolism/Transport EffectsAcetaminophen: **Substrate** (minor) of CYP1A2, 2A6, 2C9, 2D6, 2E1, 3A4; **Inhibits** CYP3A4 (weak)

Drug Interactions

Anticonvulsants (Hydantoin): May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Cholestyramine Resin: May decrease the absorption of Acetaminophen. Effect is minimal if cholestyramine is administered 1 hour after acetaminophen. *Risk D: Consider therapy modification*

Imatinib: May increase the serum concentration of Acetaminophen. *Risk D: Consider therapy modification*

Isoniazid: May enhance the adverse/toxic effect of Acetaminophen. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Acetaminophen may enhance the anticoagulant effect of Vitamin K Antagonists. Most likely with daily acetaminophen doses >1.3 g for >1 week. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Excessive intake of ethanol may increase the risk of acetaminophen-induced hepatotoxicity. Avoid ethanol or limit to <3 drinks/day.

Food: Rate of absorption may be decreased when given with food.

Test InteractionsAcetaminophen may cause false-positive urinary 5-hydroxyindoleacetic acid

Tablets (Flextra DS)

50-500 mg (30): $26.99

Mechanism of ActionAcetaminophen inhibits the synthesis of prostaglandins in the central nervous system and peripherally blocks pain impulse generation; produces antipyresis from inhibition of hypothalamic heat-regulating center. Phenyltoloxamine is an antihistamine (H_1-blocking agent) which acts primarily to inhibit secretions in the nose, mouth, and pharynx, as well as causing CNS depression.

Special Alerts

Manufacturers Voluntarily Change Pediatric OTC Product Labeling - October 7, 2008

Leading manufacturers of over-the-counter (OTC) pediatric cough and cold products, in consultation with the Food and Drug Administration (FDA), have announced that they are voluntarily transitioning product labeling as it relates to children <4 years of age. The decision to change the labeling followed a meeting on October 2, 2008, conducted by the FDA to gather additional information related to the use of these products in children. The safety of the ingredients in these products was not in question. It was found that dosing errors and accidental ingestions were the leading cause of rare adverse events in children. The new product labeling will state “Do not use in children under four years of age.” In addition, products with certain antihistamines will warn parents not to use these products to sedate or make a child sleepy. Labeling of adult products will not change. New product labels will be introduced during the 2008-2009 cough and cold season and some products will have the updated labeling by mid-October. Products with the old labeling will not be removed from the market. Prescription products are not affected.

It is important to note that these medications have not been shown to be unsafe when used correctly. Pharmacists may continue to see health care practitioners recommending these agents for use in pediatric patients, and should help to ensure that they are being used safely and at appropriate dosages. Parents should be advised that OTC cough and cold products are safe and effective when used as directed, but that they should not be used in children <4 years of age unless instructed to do so by their healthcare provider. Counseling tips from the Consumer Healthcare Products Association (CHPA) also include:

- Always follow dosing instructions exactly and use measuring devices provided with the medicine.
- Never give 2 medicines at the same time that contain the same active ingredient.
- Do not give a medicine intended for use in adults to a child.

Additional tips and information related to the labeling changes can be found on the following educational website of the CHPA: http://www.otcsafety.org.

The FDA had previously issued a Public Health Advisory reminding patients and caregivers that OTC cough and cold medications should not be used to treat infants and children <2 years of age. This is in response to the Centers for Disease Control and Prevention (CDC) report which noted that during 2004 and 2005, ~1519 children <2 years of age were seen in emergency departments for adverse effects, including overdose, associated with products containing nasal decongestants (eg, pseudoephedrine), antihistamines (eg, carbinoxamine), and cough suppressants (eg, dextromethorphan). In October of 2007, several manufacturers voluntarily removed these products in order to help reduce dosing errors and overdose in this age group.

Additional information available at the following FDA website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01899.html

For additional information on the advisory posted in January 2008, refer to the following websites:

http://www.fda.gov/medwatch/safety/2008/safety08.htm#cough

U.S. Brand NamesAllerest® Allergy and Sinus Relief [OTC]; Genapap™ Sinus Maximum Strength [OTC] [DSC]; Mapap Sinus Maximum Strength

[OTC]; Medi-Synal [OTC]; Oranyl Plus [OTC]; Ornex® Maximum Strength [OTC]; Ornex® [OTC]; Sudafed® Multi-Symptom Sinus and Cold [OTC]; Tylenol® Cold Daytime, Children's [OTC]; Tylenol® Cold, Infants [OTC] [DSC]; Tylenol® Sinus Daytime [OTC]

Canadian Brand NamesContac® Cold and Sore Throat, Non Drowsy, Extra Strength; Dristan® N.D.; Dristan® N.D., Extra Strength; Sinutab® Non Drowsy; Sudafed® Head Cold and Sinus Extra Strength; Tylenol® Decongestant; Tylenol® Sinus

Pharmacologic CategoryAlpha/Beta Agonist; Analgesic, Miscellaneous

Use: Labeled IndicationsRelief of mild-to-moderate pain; relief of congestion

Dosing: Adults

Pain (Analgesic): Oral; Based on acetaminophen component: 325-650 mg every 4-6 hours as needed; do **not** exceed 4 g/day

Decongestant: Oral: Based on pseudoephedrine component: 60 mg every 4 hours; do **not** exceed 360 mg/day

Product labeling:

Sudafed® Multi-Symptom Sinus and Cold: 2 capsules every 4-6 hours (maximum: 8 capsules/24 hours)

Tylenol® Sinus Daytime: 2 caplets or gelcaps every 4-6 hours (maximum: 8 caplets or gelcaps/24 hours)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Analgesic: Based on acetaminophen component: Oral:

Children: 10-15 mg/kg/dose every 4-6 hours as needed; do **not** exceed 5 doses in 24 hours

Decongestant: Based on pseudoephedrine component: Oral:

Children:

2-6 years: 15 mg every 4 hours; do **not** exceed 90 mg/day

6-12 years: 30 mg every 4 hours; do **not** exceed 180 mg/day

Children >12 years and Adults: Refer to adult dosing.

Product labeling:

Children's Tylenol® Cold Daytime: Children:

2-5 years (24-47 lb): 1 teaspoonful every 4-6 hours (maximum: 4 doses/24 hours)

6-11 years (48-95 lb): 2 teaspoonfuls every 4-6 hours (maximum: 4 doses/24 hours)

Sudafed® Multi-Symptom Sinus and Cold, Tylenol® Sinus Daytime: Children ≥12 years: Refer to adult dosing.

Dosing: Hepatic ImpairmentUse with caution. Limited, low-dose therapy usually well tolerated in hepatic disease/cirrhosis; however, cases of hepatotoxicity at daily acetaminophen dosages <4 g/day have been reported. Avoid chronic use in hepatic impairment.

Dietary Considerations

Sudafed® Multi-Symptom Sinus and Cold capsule contains acetaminophen 325 mg, pseudoephedrine hydrochloride 30 mg, and sodium 16 mg.

Allergy Considerations

- Acetaminophen Allergy/Hypersensitivity

Adverse ReactionsSee individual agents.

Metabolism/Transport EffectsAcetaminophen: **Substrate** (minor) of CYP1A2, 2A6, 2C9, 2D6, 2E1, 3A4; **Inhibits** CYP3A4 (weak)

Drug Interactions

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor*

therapy

Cholestyramine Resin: May decrease the absorption of Acetaminophen. Effect is minimal if cholestyramine is administered 1 hour after acetaminophen. *Risk D: Consider therapy modification*

Imatinib: May increase the serum concentration of Acetaminophen. *Risk D: Consider therapy modification*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Isoniazid: May enhance the adverse/toxic effect of Acetaminophen. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Acetaminophen may enhance the anticoagulant effect of Vitamin K Antagonists. Most likely with daily acetaminophen doses >1.3 g for >1 week. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Excessive intake of ethanol may increase the risk of acetaminophen-induced hepatotoxicity. Avoid ethanol or limit to <3 drinks/day.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Caplet:

Allerest® Allergy and Sinus Relief, Ornex®: Acetaminophen 325 mg and pseudoephedrine hydrochloride 30 mg

Genapap™ Sinus Maximum Strength [DSC], Mapap Sinus Maximum Strength, Ornex® Maximum Strength, Tylenol® Sinus Daytime: Acetaminophen 500 mg and pseudoephedrine hydrochloride 30 mg

Capsule, liquid:

Sudafed® Multi-Symptom Sinus and Cold: Acetaminophen 325 mg and pseudoephedrine hydrochloride 30 mg [contains sodium 16 mg]

Gelcap:

Tylenol® Sinus Daytime: Acetaminophen 500 mg and pseudoephedrine hydrochloride 30 mg

Liquid:

Childrens Tylenol® Cold Daytime: Acetaminophen 160 mg and pseudoephedrine hydrochloride 15 mg per 5 mL (120 mL) [contains sodium benzoate; fruit flavor]

Liquid, oral [drops]:

Infants Tylenol® Cold: Acetaminophen 80 mg and pseudoephedrine 7.5 mg per 0.8 mL [contains sodium benzoate; bubble gum flavor] [DSC]

Tablet:

Medi-Synal: Acetaminophen 325 mg and pseudoephedrine hydrochloride 30 mg

Oranyl Plus: Acetaminophen 500 mg and pseudoephedrine hydrochloride 30 mg

Generic AvailableYes

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Acetaminophen
- Pseudoephedrine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Pseudoephedrine: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response

Mental Health: Effects on Mental StatusAnxiety, insomnia, excitability common; hallucination may be seen rarely

Mental Health: Effects on Psychiatric TreatmentHypertensive crisis may result with MAO inhibitor, effects of CNS depressants may be lessened

Cardiovascular ConsiderationsSympathomimetic or sympathomimetic-containing combination products may increase blood pressure. These preparations are relatively contraindicated in patients with significant hypertension, particularly in poorly controlled hypertension. In young, healthy patients presenting with new onset blood pressure elevations, it is important to exclude the recent use of sympathomimetics as a cause for the blood pressure elevation.

Index TermsPseudoephedrine and Acetaminophen

Medication Safety Issues

Sound-alike/look-alike issues:

Ultracet® may be confused with Ultane®, Ultram®

Duplicate therapy issues: This product contains acetaminophen, which may be a component of other combination products. Do not exceed the maximum recommended daily dose of acetaminophen.

Pronunciation(a seet a MIN oh fen & TRA ma dole)

U.S. Brand NamesUltracet®

Canadian Brand NamesTramacet

Pharmacologic CategoryAnalgesic, Miscellaneous; Analgesic, Opioid

Use: Labeled IndicationsShort-term (≤5 days) management of acute pain

Use: DentalTreatment of postoperative pain (≤5 days)

Dosing: AdultsAcute pain: Oral: Two tablets every 4-6 hours as needed for pain relief (maximum: 8 tablets/day); treatment should not exceed 5 days

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentCl_{cr} <30 mL/minute: Maximum of 2 tablets every 12 hours. Treatment should not exceed 5 days.

Dosing: Hepatic ImpairmentUse is not recommended.

Calculations

- Creatinine Clearance: Adults

Dietary ConsiderationsMay be taken with or without food. Avoid use of ethanol and ethanol-containing products.

StorageStore at controlled room temperature of 25°C (77°F).

ContraindicationsHypersensitivity to acetaminophen, tramadol, opioids, or any component of the formulation; opioid-dependent patients; acute intoxication with ethanol, hypnotics, narcotics, centrally-acting analgesics, opioids, or psychotropic drugs; hepatic dysfunction

Allergy Considerations

- Acetaminophen Allergy/Hypersensitivity
- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Hepatotoxicity: May cause severe hepatic toxicity on acute overdose; in addition, chronic daily dosing in adults has resulted in liver damage in some patients.

- Seizures: Even when taken within the recommended dosage seizures may occur; risk is increased in patients receiving serotonin reuptake inhibitors (SSRIs or anorectics), tricyclic antidepressants, other cyclic compounds (including cyclobenzaprine, promethazine), neuroleptics, MAO inhibitors, or drugs which may lower seizure threshold. Patients with a history of seizures, or with a risk of seizures (head trauma, metabolic disorders, CNS infection, malignancy, or during alcohol/drug withdrawal) are also at increased risk.

Disease-related concerns:

- Abdominal conditions: May obscure diagnosis or clinical course of patients with acute abdominal conditions.

- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists.

- Ethanol use: Use with caution in patients with alcoholic liver disease; consuming ≥3 alcoholic drinks/day may increase the risk of liver damage.

- G6PD deficiency: Use with caution in patients with known G6PD deficiency.

- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.

- Renal impairment: Use tramadol with caution and reduce dosage in patients with renal impairment.

- Respiratory disease: Patients with chronic respiratory disorders may be at greater risk of adverse events.

Concurrent drug therapy issues:

- CNS depressants: Use with caution and reduce dosage when administering to patients receiving other CNS depressants.
- MAO inhibitors: Should be used only with extreme caution in patients receiving MAO inhibitors.

Special populations:

- Debilitated patients: Use with caution in debilitated patients; there is a greater potential for critical respiratory depression, even at therapeutic dosages.
- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects. Decrease initial dose.
- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Dosage limit: Limit acetaminophen dose to <4 g/day.
- Withdrawal: Tolerance or drug dependence may result from extended use (withdrawal symptoms have been reported); abrupt discontinuation should be avoided. Tapering of dose at the time of discontinuation limits the risk of withdrawal symptoms.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTramadol has been shown to cross the placenta. Postmarketing reports following tramadol use during pregnancy include neonatal seizures, withdrawal syndrome, fetal death, and stillbirth. Not recommended for use during labor and delivery.

LactationTramadol: Enters breast milk/contraindicated

Breast-Feeding ConsiderationsNot recommended for postdelivery analgesia in nursing mothers.

Adverse Reactions

1% to 10%:

Central nervous system: Somnolence (6%), dizziness (3%), insomnia (2%), anxiety, confusion, euphoria, fatigue, headache, nervousness, tremor

Dermatologic: Pruritus (2%), rash

Endocrine & metabolic: Hot flashes

Gastrointestinal: Constipation (6%), anorexia (3%), diarrhea (3%), nausea (3%), dry mouth (2%), abdominal pain, dyspepsia, flatulence, vomiting

Genitourinary: Prostatic disorder (2%)

Neuromuscular & skeletal: Weakness

Miscellaneous: Diaphoresis increased (4%)

<1%: Abnormal thinking, abnormal vision, albuminuria, amnesia, anemia, arrhythmia, ataxia, chest pain, convulsions, depersonalization, drug abuse, dysphagia, dyspnea, emotional lability, hallucination, hyper-/hypotension, hypertonia, impotence, liver function abnormalities, melena, micturition disorder, migraine, muscle contractions (involuntary), oliguria, palpitation, paresthesia, paroniria, rigors, stupor, syncope, tachycardia, tinnitus, tongue edema, urinary retention, weight loss, vertigo

Postmarketing and/or case reports: Agitation, allergic reactions, anaphylactoid reactions, anaphylaxis, cognitive dysfunction, coma, depression, diaphoresis, difficulty concentrating, fever, gastrointestinal bleeding, hepatitis, hyper-reflexia, mental status change, myocardial ischemia, orthostatic hypotension, liver failure, pulmonary edema, seizure, serotonin syndrome, shivering, Stevens-Johnson syndrome, suicidal tendency, toxic epidermal necrolysis, urticaria, vasodilation

A withdrawal syndrome may occur with abrupt discontinuation; includes anxiety, diarrhea, hallucinations (rare), nausea, pain, piloerection, rigors, sweating, and tremor. Uncommon discontinuation symptoms may include severe anxiety, panic attacks, or paresthesia.

Metabolism/Transport Effects

Acetaminophen: **Substrate** (minor) of CYP1A2, 2A6, 2C9, 2D6, 2E1, 3A4; **Inhibits** CYP3A4 (weak)

Tramadol: **Substrate** of CYP2D6 (major), 3A4 (major)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Cholestyramine Resin: May decrease the absorption of Acetaminophen. Effect is minimal if cholestyramine is administered 1 hour after acetaminophen. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Imatinib: May increase the serum concentration of Acetaminophen. *Risk D: Consider therapy modification*

Isoniazid: May enhance the adverse/toxic effect of Acetaminophen. *Risk C: Monitor therapy*

MAO Inhibitors: TraMADol may enhance the neuroexcitatory and/or seizure-potentiating effect of MAO Inhibitors. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May enhance the neuroexcitatory and/or seizure-potentiating effect of TraMADol. TraMADol may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Tricyclic Antidepressants: May enhance the neuroexcitatory and/or seizure-potentiating effect of TraMADol. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Acetaminophen may enhance the anticoagulant effect of Vitamin K Antagonists. Most likely with daily acetaminophen doses >1.3 g for >1 week. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (increased liver toxicity with concomitant use).

Food: May delay time to peak plasma levels, however, the extent of absorption is not affected.

Herb/Nutraceutical:

Acetaminophen: Avoid St John's wort (may decrease acetaminophen levels).

Tramadol: Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring ParametersPain relief, respiratory rate, blood pressure, and pulse; signs of tolerance or abuse
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: Acetaminophen 325 mg and tramadol hydrochloride 37.5 mg

Generic AvailableYes
ManufacturerOrtho-McNeil Pharmaceutical, Inc
Pricing: U.S. (www.drugstore.com)

Tablets (Tramadol-Acetaminophen)

37.5-325 mg (30): $27.99

Tablets (Ultracet)

37.5-325 mg (30): $49.42

Mechanism of Action

Based on **acetaminophen** component: Inhibits the synthesis of prostaglandins in the central nervous system and peripherally blocks pain impulse generation; produces antipyresis from inhibition of hypothalamic heat-regulating center

Based on **tramadol** component: Binds to μ-opiate receptors in the CNS causing inhibition of ascending pain pathways, altering the perception of and response to pain; also inhibits the reuptake of norepinephrine and serotonin, which also modifies the ascending pain pathway

Pharmacodynamics/KineticsSee individual agents.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation, dizziness, insomnia, anxiety, confusion, or euphoria; monitor with concurrent psychotropic use

Mental Health: Effects on Psychiatric TreatmentContraindicated with acute intoxication of psychotropic drugs. Use with extreme caution with MAO inhibitors. Seizure risk is increased with SSRIs, TCAs, antipsychotics, and MAO inhibitors. Carbamazepine may decrease the half-life of tramadol (concurrent use is not recommended). Fluoxetine and paroxetine may increase tramadol serum concentrations.

Index TermsAPAP and Tramadol; Tramadol Hydrochloride and Acetaminophen

Pharmacologic Category[Analgesic, Miscellaneous]

Use: Labeled IndicationsTreatment of mild-to-moderate pain and fever (antipyretic/analgesic); does not have antirheumatic or anti-inflammatory effects

Use: DentalTreatment of postoperative pain

Dosing: AdultsPain or fever: Oral, rectal: 325-650 mg every 4-6 hours or 1000 mg 3-4 times/day; do **not** exceed 4 g/day.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricPain or fever: Oral, rectal: Children <12 years: 10-15 mg/kg/dose every 4-6 hours as needed; do **not** exceed 5 doses (2.6 g) in 24 hours; alternatively, the following doses may be used; see table.

Acetaminophen Dosing

Age	Dosage (mg)	Age	Dosage (mg)
0-3 mo	40	4-5 y	240
4-11 mo	80	6-8 y	320
1-2 y	120	9-10 y	400
2-3 y	160	11 y	480

Note: Higher rectal doses have been studied for use in preoperative pain control in children. However, specific guidelines are not available and dosing may be product dependent. The safety and efficacy of alternating acetaminophen and ibuprofen dosing has not been established.

Dosing: Renal Impairment

Cl_{cr} 10-50 mL/minute: Administer every 6 hours.

Cl_{cr} <10 mL/minute: Administer every 8 hours (metabolites accumulate).

Moderately dialyzable (20% to 50%)

Dosing: Hepatic ImpairmentUse with caution. Limited, low-dose therapy is usually well tolerated in hepatic disease/cirrhosis. However, cases of hepatotoxicity at daily acetaminophen dosages <4 g/day have been reported. Avoid chronic use in hepatic impairment.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralShake suspension well before pouring dose.

Dietary ConsiderationsChewable tablets may contain phenylalanine (amount varies, ranges between 3-12 mg/tablet); consult individual product labeling.

StorageDo not freeze suppositories.

ContraindicationsHypersensitivity to acetaminophen or any component of the formulation

Allergy Considerations

- Acetaminophen Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- Hepatotoxicity: May cause severe hepatic toxicity on acute overdose; in addition, chronic daily dosing in adults has resulted in liver damage in some patients.

Disease-related concerns:

- Ethanol use: Use with caution in patients with alcoholic liver disease; consuming ≥3 alcoholic drinks/day may increase the risk of liver damage.

- G6PD deficiency: Use with caution in patients with known G6PD deficiency.

Other warnings/precautions:

- Dosage limit: Limit dose to <4 g/day.

- Self-medication (OTC use): When used for self-medication, patients should be instructed to contact healthcare provider if used for fever lasting >3 days or for pain lasting >10 days in adults or >5 days in children.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAcetaminophen crosses the placenta. It is generally considered to be safe for use during pregnancy when used at therapeutic doses for short periods of time.

LactationEnters breast milk/compatible

Breast-Feeding Considerations

Acetaminophen is found in breast milk. The AAP considers acetaminophen to be “compatible” with breast-feeding.

Adverse ReactionsFrequency not defined.

Dermatologic: Rash

Endocrine & metabolic: May increase chloride, uric acid, glucose; may decrease sodium, bicarbonate, calcium

Hematologic: Anemia, blood dyscrasias (neutropenia, pancytopenia, leukopenia)

Hepatic: Bilirubin increased, alkaline phosphatase increased

Renal: Ammonia increased, nephrotoxicity with chronic overdose, analgesic nephropathy

Miscellaneous: Hypersensitivity reactions (rare)

Metabolism/Transport Effects**Substrate** (minor) of CYP1A2, 2A6, 2C9, 2D6, 2E1, 3A4; **Inhibits** CYP3A4 (weak)

Drug Interactions

Anticonvulsants (Hydantoin): May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Cholestyramine Resin: May decrease the absorption of Acetaminophen. Effect is minimal if cholestyramine is administered 1 hour after acetaminophen. *Risk D: Consider therapy modification*

Imatinib: May increase the serum concentration of Acetaminophen. *Risk D: Consider therapy modification*

Isoniazid: May enhance the adverse/toxic effect of Acetaminophen. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Acetaminophen may enhance the anticoagulant effect of Vitamin K Antagonists. Most likely with daily acetaminophen doses >1.3 g for >1 week. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Excessive intake of ethanol may increase the risk of acetaminophen-induced hepatotoxicity. Avoid ethanol or limit to <3 drinks/day.

Food: Rate of absorption may be decreased when given with food.

Herb/Nutraceutical: St John's wort may decrease acetaminophen levels.

Test InteractionsIncreased chloride, bilirubin, uric acid, glucose, ammonia (B), chloride (S), uric acid (S), alkaline phosphatase (S), chloride (S); decreased sodium, bicarbonate, calcium (S)

Monitoring ParametersRelief of pain or fever

Reference Range

Therapeutic concentration (analgesic/antipyretic): 10-30 mcg/mL

Toxic concentration (acute ingestion) with probable hepatotoxicity: >200 mcg/mL at 4 hours or 50 mcg/mL at 12 hours after ingestion

Nursing: Physical Assessment/Monitoring**Assess patient for history of liver disease or ethanol abuse** (acetaminophen and excessive ethanol may have adverse liver effects). Assess other medications patient may be taking for additive or adverse interactions. Assess knowledge/teach patient appropriate use. Teach patient to monitor for adverse reactions and appropriate interventions to reduce side effects.

Monitoring: Lab TestsSerum APAP levels with long-term use in patients with hepatic disease

Patient EducationTake exactly as directed; do not increase dose or frequency. Most adverse effects are related to excessive use. Take with food or milk. While using this medication, avoid or limit alcohol to <3 drinks/day and avoid other prescription or OTC medications that contain acetaminophen. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. This medication will not reduce inflammation; consult prescriber for anti-inflammatory, if needed. Report unusual bleeding (stool, mouth, urine) or bruising; unusual fatigue and weakness; change in elimination patterns; or change in color of urine or stool.

Little Fevers™: 80 mg/1 mL (30 mL) [alcohol free; contains propylene glycol, sodium benzoate; berry flavor; packaged with dropper and forehead thermometer]

Silapap® Infant's: 80 mg/0.8 mL (15 mL, 30 mL) [contains sodium benzoate; cherry flavor]

Suppository, rectal: 120 mg, 325 mg, 650 mg

Acephen™: 120 mg, 325 mg, 650 mg

FeverALL®: 80 mg, 120 mg, 325 mg, 650 mg

Mapap: 125 mg, 650 mg

Suspension, oral: 160 mg/5 mL (5 mL, 10 mL, 20 mL)

Mapap Children's: 160 mg/5 mL (120 mL) [contains sodium benzoate; cherry flavor]

Nortemp Children’s: 160 mg/5 mL (120 mL) [alcohol free; contains sodium benzoate; cotton candy flavor]

Tylenol® Children's: 160 mg/5 mL (120 mL, 240 mL) [contains sodium benzoate; bubble gum yum, cherry blast, dye free cherry, grape splash, and very berry strawberry flavors]

Tylenol® Children’s with Flavor Creator: 160 mg/5 mL (120 mL) [contains sodium 2 mg/5 mL and sodium benzoate; cherry blast flavor; packaged with apple (4), bubblegum (8), chocolate (4), & strawberry (4) sugar free flavor packets]

Suspension, oral [drops]:

Mapap Infants: 80 mg/0.8 mL (15 mL, 30 mL) [contains sodium benzoate; cherry flavor]

Tylenol® Infants: 80 mg/0.8 mL (15 mL, 30 mL) [contains sodium benzoate; cherry, dye free cherry, and grape flavors]

Tablet: 325 mg, 500 mg

Aspirin Free Anacin® Extra Strength, Genapap™ Extra Strength, Genebs Extra Strength, Mapap Extra Strength, Pain Eze, Tylenol® Extra Strength, Valorin Extra: 500 mg

Cetafen®, Genapap™, Genebs, Mapap, Tycolene, Tylenol®, Valorin: 325 mg

Tablet, chewable: 80 mg

Genapap™ Children: 80 mg [contains phenylalanine 6 mg/tablet; grape flavors] [DSC]

Mapap Children's: 80 mg [contains phenylalanine 3 mg/tablet; bubble gum, fruit, and grape flavors]

Mapap Junior Strength: 160 mg [contains phenylalanine 12 mg/tablet; grape flavor]

Tablet, orally disintegrating: 80 mg, 160 mg

Tylenol® Children’s Meltaways: 80 mg [bubble gum, grape, and watermelon flavors]

Tylenol® Junior Meltaways: 160 mg [bubble gum and grape flavors]

Generic AvailableYes: Excludes extended release products

Pricing: U.S. (www.drugstore.com)

Tablet, controlled release (Tylenol Arthritis Pain)

650 mg (100): $19.99

Tablets (Acetaminophen)

500 mg (700): $38.99

Tablets (Tylenol)

325 mg (100): $16.99

Mechanism of ActionInhibits the synthesis of prostaglandins in the central nervous system and peripherally blocks pain impulse generation; produces antipyresis from inhibition of hypothalamic heat-regulating center

Pharmacodynamics/Kinetics

Onset of action: <1 hour

Duration: 4-6 hours

Absorption: Incomplete; varies by dosage form

Protein binding: 8% to 43% at toxic doses

Metabolism: At normal therapeutic dosages, hepatic to sulfate and glucuronide metabolites, while a small amount is metabolized by CYP to a highly reactive intermediate (acetylimidoquinone) which is conjugated with glutathione and inactivated; at toxic doses (as little as 4 g daily) glutathione conjugation becomes insufficient to meet the metabolic demand causing an increase in acetylimidoquinone concentration, which may cause hepatic cell necrosis

Half-life elimination: Prolonged following toxic doses

Neonates: 2-5 hours

Adults: 1-3 hours (may be increased in elderly; however, this should not affect dosing)

Time to peak, serum: Oral: 10-60 minutes; may be delayed in acute overdoses

Excretion: Urine (2% to 5% unchanged; 55% as glucuronide metabolites; 30% as sulphate metabolites)

Dental Health Professional ConsiderationsHepatotoxicity caused by acetaminophen is potentiated by chronic ethanol consumption. People who consume ethanol at the same time that they use acetaminophen, even in therapeutic doses, are at risk of developing hepatotoxicity.

A study by Hylek, et al, suggested that the combination of acetaminophen with warfarin (Coumadin®) may cause enhanced anticoagulation. The following recommendations have been made by Hylek, et al, and supported by an editorial in *JAMA* by Bell.

Dose and duration of acetaminophen should be as low as possible, individualized, and monitored.

The study by Hylek reported that for patients who reported taking the equivalent of at least 4 regular strength (325 mg) tablets for longer than a week, the odds of having an INR >6.0 were increased 10-fold above those not taking acetaminophen. Risk decreased with lower intakes of acetaminophen reaching a background level of risk at a dose of 6 or fewer 325 mg tablets per week.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported (see Dental Comment)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentBarbiturates and carbamazepine may increase the hepatotoxic potential of acetaminophen

Anesthesia and Critical Care Concerns/Other ConsiderationsAvoid excessive doses of acetaminophen particularly in patients with a significant alcohol history or poor nutritional habits. The 2002 ACCM/SCCM guidelines for analgesia (critically-ill adult) recommend prescribing <2 g/day for patients with a significant alcohol history or those with malnutrition. Other patients may be limited to <4 g/day. Susceptibility to acetaminophen hepatotoxicity may be due to induction of hepatic enzymes caused by chronic alcohol ingestion, depletion of glutathione, malnutrition, and impaired glucuronidation caused by fasting.

Index TermsAPAP; N-Acetyl-P-Aminophenol; Paracetamol

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - Updated: December 2008

The U.S. Food and Drug Administration (FDA) has issued an update following the completion of its analysis concerning the risk of suicidality (suicidal behavior or ideation) observed during clinical trials of various antiepileptic drugs (compared to placebo) in the treatment of epilepsy, psychiatric disorders, and other conditions. The pooled analysis of 199 clinical trials involving 11 antiepileptic drugs (carbamazepine, divalproex sodium, felbamate, gabapentin, lamotrigine, levetiracetam, oxcarbazepine, pregabalin, tiagabine, topiramate, zonisamide) as either monotherapy or as adjuvant therapy showed that patients receiving an antiepileptic had a 0.43% risk of suicidal behavior/ideation compared to 0.24% of patients receiving placebo. As a result of the findings, the FDA will require that the product labeling of the entire class of antiepileptics include a warning concerning the risk of suicidality, and a medication guide be developed informing patients of this risk.

Additional information may be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Antiepileptics: Increased Risk of Suicidal Behavior or Ideation - February 2008

The U.S. Food and Drug Administration (FDA) is informing healthcare professionals of an increased risk of suicidality (suicidal behavior or ideation) observed from analysis of clinical studies using various antiepileptic medications compared to placebo. The analysis was performed on 199 placebo-controlled studies involving 43,892 patients (27,863 treated patients versus 16,029 placebo patients) aged ≥5 years receiving one of the following 11 drugs: carbamazepine (Carbatrol®, Equetro™, Tegretol®, Tegretol® XR), felbamate (Felbatol®), gabapentin (Neurontin®), lamotrigine (Lamictal®), levetiracetam (Keppra®), oxcarbazepine (Trileptal®), pregabalin (Lyrica®), tiagabine (Gabitril®), topiramate (Topamax®), valproate (Depakote®, Depakote® ER, Depakene®, Depacon®), and zonisamide (Zonegran®). Studies examined medication efficacy in a variety of disorders, including epilepsy, psychiatric disorders (eg, depression, bipolar disorder), and other conditions (eg, migraine, neuropathic pain). According to the FDA, the results revealed a statistically significant increased risk of suicidality in 0.43% treated patients compared to 0.22% placebo patients, or an estimated 2.1 per 1000 (95% CI: 0.7, 4.2) more patients in the treated groups relative to placebo. This increased risk was reported anywhere from 1 week of therapy through 24 weeks. However, most trials were ≤24 weeks duration and the risk of suicide extending beyond 24 weeks is currently unknown. The relative risk of suicidal behavior or ideation in the treated patients was higher for patients with epilepsy (RR=3.6) compared to patients treated for psychiatric (RR=1.6) or other conditions (RR=2.3). Overall, the incidence of suicidal behavior or ideation occurred consistently across all demographic subgroups and with each of the drugs studied. Of note, four patients receiving an antiepileptic committed suicide relative to none in the placebo groups.

Forthcoming product labeling changes are likely to extend to all antiepileptic drugs and not limited to the drugs used in the studies, pending discussions scheduled for the upcoming advisory committee meeting. Healthcare professionals and family members/caregivers are encouraged to monitor patients receiving any antiepileptic medication for signs/symptoms of suicidality (eg, anxiety, depression, behavior changes). Patients should not stop taking their antiepileptic therapy unless advised by a healthcare professional.

Additional information can be found at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Antiepileptic

Medication Safety Issues

Sound-alike/look-alike issues:

AcetaZOLAMIDE may be confused with acetoHEXAMIDE

Diamox® Sequels® may be confused with Diabinese®, Dobutrex®, Trimox®

Pronunciation(a set a ZOLE a mide)

U.S. Brand NamesDiamox® Sequels®

Canadian Brand NamesApo-Acetazolamide®; Diamox®

Pharmacologic CategoryAnticonvulsant, Miscellaneous; Carbonic Anhydrase Inhibitor; Diuretic, Carbonic Anhydrase Inhibitor; Ophthalmic Agent, Antiglaucoma

Use: Labeled IndicationsTreatment of glaucoma (chronic simple open-angle, secondary glaucoma, preoperatively in acute angle-closure); drug-induced edema or edema due to congestive heart failure (adjunctive therapy); centrencephalic epilepsies (immediate release dosage form); prevention or amelioration of symptoms associated with acute mountain sickness

Use: Unlabeled/InvestigationalUrine alkalinization; respiratory stimulant in COPD; metabolic alkalosis

Dosing: Adults**Note:** I.M. administration is not recommended.

Glaucoma:

Chronic simple (open-angle): Oral: 250 mg 1-4 times/day or 500 mg extended release capsule twice daily

Secondary, acute (closed-angle): I.V.: 250-500 mg, may repeat in 2-4 hours to a maximum of 1 g/day

Edema: Oral, I.V.: 250-375 mg once daily

Epilepsy: Oral: 8-30 mg/kg/day in 1-4 divided doses, not to exceed 1 g/day. **Note:** Extended release capsule is not recommended for treatment of epilepsy.

Metabolic alkalosis (unlabeled use): I.V. 250 mg every 6 hours for 4 doses or 500 mg single dose; reassess need based upon acid-base status

Mountain sickness: Oral: 250 mg every 8-12 hours (or 500 mg extended release capsules every 12-24 hours). Therapy should begin 24-48 hours before and continue during ascent and for at least 48 hours after arrival at the high altitude.

Note: In situations of rapid ascent (such as rescue or military operations), 1000 mg/day is recommended.

Urine alkalinization (unlabeled use): Oral: 5 mg/kg/dose repeated 2-3 times over 24 hours

Respiratory stimulant in COPD (unlabeled use): Oral, I.V.: 250 mg twice daily

Dosing: ElderlyOral: Initial: 250 mg once or twice daily; use lowest effective dose possible.

Dosing: Pediatric**Note:** I.M. administration is not recommended.

Glaucoma:

Oral: 8-30 mg/kg/day or 300-900 mg/m^2/day divided every 8 hours

I.V.: 20-40 mg/kg/24 hours divided every 6 hours, not to exceed 1 g/day

Edema: Oral, I.V.: 5 mg/kg or 150 mg/m^2 once every day

Epilepsy: Oral: Refer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} 10-50 mL/minute: Administer every 12 hours.

Cl_{cr} <10 mL/minute: Avoid use (ineffective).

Moderately dialyzable (20% to 50%)

Calculations

- Body Surface Area: Pediatrics
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.M.

I.M. administration is painful because of the alkaline pH of the drug; use by this route is not recommended.

Administration: I.V. DetailpH: 9.2

Administration: OralOral: May cause an alteration in taste, especially carbonated beverages. Short-acting tablets may be crushed and suspended in cherry or chocolate syrup to disguise the bitter taste of the drug; do not use fruit juices. Alternatively, submerge tablet in 10 mL of hot water and add 10 mL honey or syrup.

Dietary ConsiderationsMay be taken with food to decrease GI upset. May have additive effects with other folic acid antagonists. Sodium content of 500 mg injection: 47.2 mg (2.05 mEq).

Storage

Capsules, tablets: Store at controlled room temperature.

Injection: Store vial for injection (prior to reconstitution) at controlled room temperature. Reconstituted solution may be refrigerated (2°C to 8°C) for 1 week, however, use within 12 hours is recommended. Stability of IVPB solution is 5 days at room temperature (25°C) and 44 days at refrigeration (5°C).

ReconstitutionInjection: Reconstitute with at least 5 mL sterile water to provide a solution containing not more than 100 mg/mL. Further dilute in D_5W or NS for I.V. infusion.

CompatibilityStable in dextran 6% in D_5W, dextran 6% in NS, D_5LR, D_5NS, $D_5{}^1/_2NS$, $D_5{}^1/_4NS$, D_5W, $D_{10}W$, LR, NS, $^1/_2NS$.

Y-site administration: Variable (consult detailed reference): Diltiazem, TPN.

Compatibility when admixed: Compatible: Cimetidine, ranitidine. **Incompatible:** Multivitamins.

Extemporaneously PreparedTablets may be crushed and suspended in cherry, chocolate, raspberry, or other highly-flavored carbohydrate syrup in concentrations of 25-100 mg/mL; simple suspensions are stable for 7 days. For solutions with longer stability, see references for Parastampuria and Alexander.

Parastampuria J and Gupta VD, “Development of Oral Liquid Dosage Forms of Acetazolamide,” *J Pharm Sci*, 1990, 79:385-6.

ContraindicationsHypersensitivity to acetazolamide, sulfonamides, or any component of the formulation; hepatic disease or insufficiency; decreased sodium and/or potassium levels; adrenocortical insufficiency, cirrhosis; hyperchloremic acidosis, severe renal disease or dysfunction; severe pulmonary obstruction; long-term use in noncongestive angle-closure glaucoma

Allergy Considerations

- Carbonic Anhydrase Inhibitor Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS effects: Impairment of mental alertness and/or physical coordination may occur.
- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonylurea allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Diabetes: Use with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.
- Hepatic impairment: Use with caution in patients with hepatic dysfunction; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.
- Respiratory acidosis: Use with caution in patients with respiratory acidosis.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to side effects.

Other warnings/precautions:

- I.M. administration: Painful because of the alkaline pH of the drug; use by this route is not recommended.

Geriatric ConsiderationsMalaise and complaints of tiredness and myalgia are signs of excessive dosing and acidosis in older adults. Orthostatic hypotension may occur; assess blood pressure.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic in animal studies, however, there are no adequate and well-controlled studies in pregnant women.

LactationEnters breast milk/not recommended (AAP rates “compatible”)

Adverse ReactionsFrequency not defined.

Cardiovascular: Flushing

Central nervous system: Ataxia, confusion, convulsions, depression, dizziness, drowsiness, excitement, fatigue, fever, headache, malaise

Dermatologic: Allergic skin reactions, photosensitivity, Stevens-Johnson syndrome, toxic epidermal necrolysis, urticaria

Endocrine & metabolic: Electrolyte imbalance, growth retardation (children), hyperglycemia, hypoglycemia, hypokalemia, hyponatremia, metabolic acidosis

Gastrointestinal: Appetite decreased, diarrhea, melena, nausea, taste alteration, vomiting

Genitourinary: Crystalluria, glycosuria, hematuria, polyuria, renal failure

Hematologic: Agranulocytosis, aplastic anemia, leukopenia, thrombocytopenia, thrombocytopenic purpura

Hepatic: Cholestatic jaundice, fulminant hepatic necrosis, hepatic insufficiency, liver function tests abnormal

Local: Pain at injection site

Neuromuscular & skeletal: Flaccid paralysis, paresthesia

Ocular: Myopia

Otic: Hearing disturbance, tinnitus

Miscellaneous: Anaphylaxis

Metabolism/Transport Effects**Inhibits** CYP3A4 (weak)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alpha-/Beta-Agonists: Carbonic Anhydrase Inhibitors may decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Dipivefrin. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Amphetamines: Carbonic Anhydrase Inhibitors may decrease the excretion of Amphetamines. *Risk C: Monitor therapy*

Anticonvulsants (Barbiturate): Carbonic Anhydrase Inhibitors may enhance the adverse/toxic effect of Anticonvulsants (Barbiturate). Specifically, osteomalacia and rickets. *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): Carbonic Anhydrase Inhibitors may enhance the adverse/toxic effect of Anticonvulsants (Hydantoin). Specifically, osteomalacia and rickets. *Risk C: Monitor therapy*

CarBAMazepine: Carbonic Anhydrase Inhibitors may increase the serum concentration of CarBAMazepine. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Flecainide: Carbonic Anhydrase Inhibitors may decrease the excretion of Flecainide. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ketorolac: May diminish the therapeutic effect of Anticonvulsants. *Risk C: Monitor therapy*

Mefloquine: May diminish the therapeutic effect of Anticonvulsants. Mefloquine may decrease the serum concentration of Anticonvulsants. Management: Mefloquine is contraindicated in persons with a history of convulsions. If anticonvulsant is being used for another indication monitor response to treatment closely, as concurrent mefloquine may decrease response to treatment. *Risk D: Consider therapy modification*

Memantine: Carbonic Anhydrase Inhibitors may decrease the excretion of Memantine. *Risk C: Monitor therapy*

Methenamine: Carbonic Anhydrase Inhibitors may diminish the therapeutic effect of Methenamine. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Primidone: Carbonic Anhydrase Inhibitors may enhance the adverse/toxic effect of Primidone. Specifically, osteomalacia and rickets. Carbonic Anhydrase Inhibitors may decrease the serum concentration of Primidone. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: Carbonic Anhydrase Inhibitors may decrease the excretion of QuiNIDine. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May enhance the adverse/toxic effect of Carbonic Anhydrase Inhibitors. Salicylate toxicity might be enhanced by this same combination. *Risk D: Consider therapy modification*

Trientine: Carbonic Anhydrase Inhibitor Diuretics may decrease the serum concentration of Trientine. *Risk C: Monitor therapy*

Test InteractionsMay cause false-positive results for urinary protein with Albustix®, Labstix®, Albutest®, Bumintest®; interferes with HPLC theophylline assay and serum uric acid levels

Monitoring ParametersIntraocular pressure, potassium, serum bicarbonate; serum electrolytes, periodic CBC with differential; monitor growth in pediatric patients

Nursing: Physical Assessment/MonitoringAssess allergy history prior to beginning therapy. Assess effectiveness and interactions of other medications patient may be taking. Monitor for signs of excessive dosing and acidosis (especially in elderly). Measure intraocular pressure at the beginning of therapy and periodically while on this medication. Assess results of laboratory tests, therapeutic effectiveness, and adverse response. Monitor growth in pediatric patients. Monitor blood glucose levels closely if patients have diabetes. Assess knowledge/teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsIntraocular pressure, serum electrolytes, periodic CBC with differential

Patient EducationTake as directed; do not chew or crush long-acting capsule (contents may be sprinkled on soft food). May be administered with food to decrease GI upset. You will need periodic ophthalmic examinations while taking this medication. You may experience drowsiness, dizziness, or weakness (use caution when driving or engaging in tasks that require alertness until response to drug is known); or nausea, loss of appetite, or altered taste (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Monitor serum glucose closely (may cause altered blood glucose in some patients with diabetes, or unusual response to some forms of glucose testing). You may experience increased sensitivity to sunlight (use sunblock, protective clothing, and avoid exposure to direct sunlight). Report unusual and persistent tiredness; numbness, burning, or tingling of extremities or around mouth, lips, or anus; muscle weakness; black stool; or excessive depression. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, extended release:

Diamox® Sequels®: 500 mg

Injection, powder for reconstitution: 500 mg

Tablet: 125 mg, 250 mg

Generic AvailableYes: Injection, tablet

Pricing: U.S. (www.drugstore.com)

Capsule, 12-hour (Diamox Sequels)

500 mg (60): $249.98

Tablets (AcetaZOLAMIDE)

125 mg (90): $15.00

250 mg (60): $29.99

Mechanism of ActionReversible inhibition of the enzyme carbonic anhydrase resulting in reduction of hydrogen ion secretion at renal tubule and an increased renal excretion of sodium, potassium, bicarbonate, and water to decrease production of aqueous humor; also inhibits carbonic anhydrase in central nervous system to retard abnormal and excessive discharge from CNS neurons

Pharmacodynamics/Kinetics

Onset of action: Capsule, extended release: 2 hours; I.V.: 2 minutes

Peak effect: Capsule, extended release: 8-12 hours; I.V.: 15 minutes; Tablet: 2-4 hours

Duration: Inhibition of aqueous humor secretion: Capsule, extended release: 18-24 hours; I.V.: 4-5 hours; Tablet: 8-12 hours

Distribution: Erythrocytes, kidneys; blood-brain barrier and placenta; distributes into milk (~30% of plasma concentrations)

Excretion: Urine (70% to 100% as unchanged drug)

Related Information

- Anticonvulsants by Seizure Type
- Glaucoma Drug Therapy
- Status Epilepticus
- Sulfonamide Derivatives

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Metallic taste (resolves upon discontinuation)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common, may produce depression less commonly

Mental Health: Effects on Psychiatric TreatmentCan rarely cause bone marrow suppression, therefore, use cautiously with clozapine and carbamazepine; may increase the excretion of lithium

Medication Safety Issues

Sound-alike/look-alike issues:

VoSol® may be confused with Vexol®

Pronunciation(a SEE tik AS id, PRO pa leen GLY kole dye AS e tate, & hye droe KOR ti sone)

U.S. Brand NamesAcetasol® HC; VoSol® HC

Pharmacologic CategoryOtic Agent, Anti-infective

Use: Labeled IndicationsTreatment of superficial infections of the external auditory canal caused by organisms susceptible to the action of the antimicrobial, complicated by swelling

Dosing: AdultsOtitis externa (superficial): Otic: Instill 3-5 drops in ear(s) every 4-6 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricChildren ≥3 years: Refer to adult dosing.

Administration: OtherAfter removing cerumen and debris, solution may be applied by inserting a cotton wick into the ear canal and saturating with the solution. Wick may remain in place for 24 hours and then removed; however, drops should continue to be instilled into ear canal as long as indicated.

ContraindicationsHypersensitivity to acetic acid, propylene glycol, hydrocortisone, or any component of the formulation; perforated tympanic membrane; herpes simplex; vaccinia, and varicella

Allergy Considerations

- Corticosteroid Allergy

Adverse ReactionsFrequency not defined: Otic: Transient burning or stinging may be noticed occasionally when the solution is first instilled into the acutely inflamed ear

Metabolism/Transport EffectsHydrocortisone: **Substrate** of CYP3A4 (minor); **Induces** CYP3A4 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors: Corticosteroids (Systemic) may enhance the adverse/toxic effect of Acetylcholinesterase Inhibitors. Increased muscular weakness may occur. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Amphotericin B: Corticosteroids (Systemic) may enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Antacids: May decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

Antidiabetic Agents: Corticosteroids (Systemic) may diminish the hypoglycemic effect of Antidiabetic Agents. In some instances, corticosteroid-mediated HPA axis suppression has led to episodes of acute adrenal crisis, which may manifest as enhanced hypoglycemia, particularly in the setting of insulin or other antidiabetic agent use. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Aprepitant: May increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Corticosteroids (Oral). *Risk C: Monitor therapy*

Calcitriol: Corticosteroids (Systemic) may diminish the therapeutic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

CycloSPORINE: Corticosteroids (Systemic) may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Estrogen Derivatives: May increase the serum concentration of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Fosaprepitant: May increase the serum concentration of Corticosteroids (Systemic). The active metabolite aprepitant is likely responsible for this effect. *Risk D: Consider therapy modification*

Isoniazid: Corticosteroids (Systemic) may decrease the serum concentration of Isoniazid. *Risk C: Monitor therapy*

Loop Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Loop Diuretics. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Corticosteroids (Systemic). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Neuromuscular-Blocking Agents (Nondepolarizing): May enhance the adverse neuromuscular effect of Corticosteroids (Systemic). Increased muscle weakness, possibly progressing to polyneuropathies and myopathies, may occur. *Risk D: Consider therapy modification*

NSAID (COX-2 Inhibitor): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Corticosteroids (Systemic) may enhance the adverse/toxic effect of NSAID (Nonselective). *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Primidone: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Quinolone Antibiotics: May enhance the adverse/toxic effect of Corticosteroids (Systemic). Risk of tendon-related side effects, including tendonitis and rupture, may be enhanced. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Thiazide Diuretics: Corticosteroids (Systemic) may enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Warfarin: Corticosteroids (Systemic) may enhance the anticoagulant effect of Warfarin. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringSee individual agent for Hydrocortisone.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, otic [drops]:

Acetasol® HC, VoSol® HC: Acetic acid 2%, propylene glycol diacetate 3%, and hydrocortisone 1% (10 mL)

Medication Safety Issues

Sound-alike/look-alike issues:

VoSol® may be confused with Vexol®

Pronunciation(a SEE tik AS id)

Pharmacologic CategoryOtic Agent, Anti-infective; Topical Skin Product

Use: Labeled IndicationsIrrigation of the bladder; treatment of superficial bacterial infections of the external auditory canal

Dosing: Adults

Irrigation (**Note:** Dosage of an irrigating solution depends on the capacity or surface area of the structure being irrigated):

For continuous irrigation of the urinary bladder with 0.25% acetic acid irrigation, the rate of administration will approximate the rate of urine flow; usually 500-1500 mL/24 hours

For periodic irrigation of an indwelling urinary catheter to maintain patency, about 50 mL of 0.25% acetic acid irrigation is required

Otitis externa: Otic: Insert saturated wick; keep moist 24 hours; remove wick and instill 5 drops 3-4 times/day

Dosing: ElderlyRefer to adult dosing.

ContraindicationsHypersensitivity to acetic acid or any component of the formulation; during transurethral procedures

Warnings/Precautions

Concerns related to adverse effects:

- Acidosis: Systemic acidosis may result from absorption.
- Bladder irritation: Use of irrigation in patients with mucosal lesions of urinary bladder may cause irritation.

Other warnings/precautions:

- Administration: Not for internal intake or I.V. infusion; topical use or irrigation use only.

Pregnancy Risk FactorC

Adverse Reactions<1%: Hematuria, systemic acidosis, urologic pain

Drug InteractionsThere are no known significant interactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution for irrigation: 0.25% (250 mL, 500 mL, 1000 mL)

Solution, otic: 2% (15 mL)

Generic AvailableYes

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

Lithostat® may be confused with Lithobid®

Pronunciation(a SEE toe hye droks am ik AS id)
U.S. Brand NamesLithostat®
Canadian Brand NamesLithostat®
Pharmacologic CategoryUrinary Tract Product
Use: Labeled IndicationsAdjunctive therapy in chronic urea-splitting urinary infection
Dosing: AdultsSusceptible infections: Oral: 250 mg 3-4 times/day for a total daily dose of 10-15 mg/kg/day
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricSusceptible infections: Oral: Initial: 10 mg/kg/day
Dosing: Renal ImpairmentNot recommended for use in significant renal impairment (Sr_{cr} >2.5 mg/dL).
Administration: OralShould be administered on an empty stomach.
Dietary ConsiderationsShould be taken on an empty stomach, 1 hour before or 2 hours after meals.
ContraindicationsHypersensitivity to acetohydroxamic acid or any component of the formulation; pregnancy
Warnings/Precautions

Concerns related to adverse effects:

- Bone marrow suppression: May suppress bone marrow function; use with caution in patients with prior bone marrow depression. Close monitoring of hematologic function is recommended.

- Hemolytic anemia: Has been associated with hemolytic anemia (Coombs' negative), which may be associated with gastrointestinal distress and systemic symptoms; use with caution in patients with anemia. Monitor hematologic parameters during extended therapy.

- Hepatotoxicity: May cause hepatic injury; close monitoring of hepatic function is recommended.

Disease-related concerns:

- Psychiatric disorders: Use with caution in patients with pre-existing psychiatric disorders; may be associated with nervousness, anxiety, and/or depression.

Pregnancy Risk FactorX
LactationExcretion in breast milk unknown/not recommended
Adverse ReactionsFrequency not defined.

Cardiovascular: Deep vein thrombosis (rare), embolism, palpitation, phlebitis

Central nervous system: Anorexia, anxiety, depression, headache, malaise, nervousness, tremor

Dermatologic: Flushing (with ethanol consumption), rash (nonpruritic, macular)

Gastrointestinal: Nausea, vomiting

Hematologic: Hemolytic anemia (15% with laboratory evidence; ~3% severe requiring discontinuation; may be accompanied by GI symptoms or systemic complaints of malaise and/or fatigue); hyperbilirubinemia

Respiratory: Pulmonary embolism (rare)

Drug InteractionsThere are no known significant interactions.
Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase incidence of rash and/or flushing).

Food: May decrease absorption of acetohydroxamic acid.

Monitoring ParametersIn patients receiving therapy >2 weeks, monitor CBC with reticulocytes at 3-month intervals during the duration of treatment.
Monitoring: Lab TestsIn patients receiving therapy >2 weeks, monitor CBC with reticulocytes at 3-month intervals during the duration of treatment.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Lithostate®: 250 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Lithostat)

250 mg (100): $143.99

Mechanism of ActionAcetohydroxamic acid inhibits bacterial urease enzymes, decreasing the formation of ammonia in the urine by urea-splitting organisms. A reduction in urinary ammonia may increase the antibacterial activity of some antibiotic agents.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Medication Safety Issues

Sound-alike/look-alike issues:

Acetylcholine may be confused with acetylcysteine

Pronunciation(a se teel KOE leen)
U.S. Brand NamesMiochol®-E
Canadian Brand NamesMiochol®-E
Pharmacologic CategoryCholinergic Agonist; Ophthalmic Agent, Miotic
Use: Labeled IndicationsProduces complete miosis in cataract surgery, keratoplasty, iridectomy, and other anterior segment surgery where rapid miosis is required
Dosing: AdultsTo produce miosis: Intraocular: 0.5-2 mL of 1% injection (5-20 mg) instilled into anterior chamber before or after securing one or more sutures
Dosing: ElderlyRefer to adult dosing.
Administration: OtherOpen under aseptic conditions only. Attach filter before irrigating eye.
StorageStore unopened vial at 4°C to 25°C (39°F to 77°F); prevent from freezing. Prepare solution immediately before use and discard unused portion. Acetylcholine solutions are unstable.
ReconstitutionReconstitute immediately before use.
ContraindicationsHypersensitivity to acetylcholine chloride or any component of the formulation; acute iritis and acute inflammatory disease of the anterior chamber
Warnings/Precautions

Disease-related concerns:

- Diseases affected by systemic effects: Systemic effects rarely occur but can cause problems for patients with asthma, GI spasm, acute heart failure, hyperthyroidism, Parkinson's disease, peptic ulcer disease, and or urinary tract obstruction.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Aseptic conditions: Open under aseptic conditions only.
- Cataract surgery: During cataract surgery, use only after lens is in place.

Pregnancy Risk FactorC
Pregnancy ConsiderationsAcetylcholine is used primarily in the eye and there are no reports of its use in pregnancy. Because it is ionized at physiologic pH, transplacental passage would not be expected.
Adverse ReactionsFrequency not defined.

Cardiovascular: Bradycardia, flushing, hypotension

Central nervous system: Headache

Ocular: Clouding, corneal edema, decompensation

Respiratory: Dyspnea

Miscellaneous: Diaphoresis

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the adverse/toxic effect of Cholinergic Agonists. *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Powder for solution, intraocular, as chloride:

Miochol®-E: 1:100 [20 mg; packaged with diluent (2 mL)]

Generic AvailableNo
Mechanism of ActionCauses contraction of the sphincter muscles of the iris, resulting in miosis and contraction of the ciliary muscle, leading to accommodation spasm
Pharmacodynamics/Kinetics

Onset of action: Rapid

Duration: ~10 minutes

Related Information

- Glaucoma Drug Therapy

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentIntraocular product; should not impact psychiatric drug treatment

Cardiovascular ConsiderationsSystemic effects are rare after intraocular administration, but can occur. Caution should be used in patients with cardiovascular disease.

Anesthesia and Critical Care Concerns/Other ConsiderationsSystemic effects are rare after intraocular administration, but can occur. Caution should be used in patients with cardiovascular disease.

Index TermsAcetylcholine Chloride

International Brand NamesAcetilcolina Colirio (AR); Acetilcolina Cusi (ES); Miochol (FI, GR, LU, NL, NZ); Miochol-E (AU, BE, CH, CN, DE, DK, FI, GB, HK, ID, IE, IL, IT, KP, NL, NO, SE, ZA); Miochole (FR); Miovisin (IT); OQ-Miot (CO)

Medication Safety Issues

Sound-alike/look-alike issues:

Acetylcysteine may be confused with acetylcholine

Mucomyst® may be confused with Mucinex®

Pronunciation(a se teel SIS teen)

U.S. Brand NamesAcetadote®

Canadian Brand NamesAcetylcysteine Solution; Mucomyst®; Parvolex®

Pharmacologic CategoryAntidote; Mucolytic Agent

Use: Labeled IndicationsAdjunctive mucolytic therapy in patients with abnormal or viscid mucous secretions in acute and chronic bronchopulmonary diseases; pulmonary complications of surgery and cystic fibrosis; diagnostic bronchial studies; antidote for acute acetaminophen toxicity

Use: Unlabeled/InvestigationalPrevention of radiocontrast-induced renal dysfunction (oral, I.V.); distal intestinal obstruction syndrome (DIOS, previously referred to as meconium ileus equivalent)

Dosing: Adults

Acetaminophen poisoning:

Oral: 140 mg/kg; followed by 17 doses of 70 mg/kg every 4 hours; repeat dose if emesis occurs within 1 hour of administration; therapy should continue until acetaminophen levels are undetectable and there is no evidence of hepatotoxicity.

I.V. (Acetadote®): Loading dose: 150 mg/kg over 60 minutes; **Note:** Extended infusion time recommended by manufacturer as of February, 2006. Loading dose is followed by 2 additional infusions: Initial maintenance dose of 50 mg/kg infused over 4 hours, followed by a second maintenance dose of 100 mg/kg infused over 16 hours. Total dosage: 300 mg/kg administered over 21 hours.

Patients <40 kg: Reduce fluid volume according to the following table.

Acetadote® Dosing / Fluid Volume Guidelines for Patients <40 kg

Body Weight (kg)	**Loading Dose 150 mg/kg over 1 h**		**Second Dose 50 mg/kg over 4 h**		**Third Dose 100 mg/kg over 16 h**	
	Acetadote® (mL)	**D_5W (mL)**	**Acetadote® (mL)**	**D_5W (mL)**	**Acetadote® (mL)**	**D_5W (mL)**
30	22.5	100	7.5	250	15	500
25	18.75	100	6.25	250	12.5	500
20	15	60	5	140	10	280
15	11.25	45	3.75	105	7.5	210
10	7.5	30	2.5	70	5	140

Note: If commercial I.V. form is unavailable, the following dose has been reported using solution for oral inhalation (unlabeled): Loading dose: 140 mg/kg, followed by 70 mg/kg every 4 hours, for a total of 13 doses (loading dose and 48 hours of treatment); infuse each dose over 1 hour through a 0.2 micron Millipore filter (in-line).

Shorter treatment courses have been proposed (Woo, 2000), however, only the full course of therapy is currently FDA approved

Adjuvant therapy in respiratory conditions:

Note: Patients should receive bronchodilator 15 minutes prior to dose.

Inhalation, nebulization (face mask, mouth piece, tracheostomy): Acetylcysteine 10% and 20% solution (dilute 20% solution with sodium chloride or sterile water for inhalation); 10% solution may be used undiluted: 3-5 mL of 20% solution or 6-10 mL of 10% solution until nebulized given 3-4 times/day; dosing range: 1-10 mL of 20% solution or 2-20 mL of 10% solution every 2-6 hours

Inhalation, nebulization (tent, croupette): Dose must be individualized; may require up to 300 mL solution/treatment

Direct instillation:

Into tracheostomy: 1-2 mL of 10% to 20% solution every 1-4 hours

Through percutaneous intratracheal catheter: 1-2 mL of 20% or 2-4 mL of 10% solution every 1-4 hours via syringe attached to catheter

Diagnostic bronchogram: Nebulization or intratracheal: 1-2 mL of 20% solution or 2-4 mL of 10% solution administered 2-3 times prior to procedure

Prevention of radiocontrast-induced renal dysfunction (unlabeled use): Oral: 600 mg twice daily for 2 days (beginning the day before the procedure); may be given as powder in capsules, some centers use solution (diluted in cola beverage or juice). Hydrate patient with saline concurrently.

Prevention of contrast-induced nephropathy (CIN) (unlabeled use): Oral: 600-1200 mg twice daily for 2 days (beginning the day before the procedure); may be given as powder in capsules (some centers use solution, diluted in cola beverage or juice)

Prevention of CIN in acute MI patients requiring emergent cardiac catheterization (unlabeled use):I.V.: 1200 mg over 5-10 minutes prior to cardiac catheterization, followed by 1200 mg **orally** twice daily for 48 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Acetaminophen poisoning: Refer to adult dosing.

Adjuvant therapy in respiratory conditions:

Note: Patients should receive an aerosolized bronchodilator 10-15 minutes prior to acetylcysteine

Inhalation, nebulization (face mask, mouth piece, tracheostomy): Acetylcysteine 10% and 20% solution (dilute 20% solution with sodium chloride or sterile water for inhalation); 10% solution may be used undiluted.

Infants: 1-2 mL of 20% solution or 2-4 mL 10% solution until nebulized given 3-4 times/day

Children: Refer to adult dosing.

Inhalation, nebulization (tent, croupette): Children: Refer to adult dosing.

Administration: I.V.Intravenous formulation (Acetadote®): Administer loading dose of 150 mg/kg over 60 minutes (see **"Note"**), followed by 2 separate maintenance infusions: 50 mg/kg over 4 hours followed by 100 mg/kg over 16 hours. If not using commercially available I.V. formulation, use a 0.2-µ millipore filter (in-line).

Note: Extended infusion time recommended by manufacturer as of February, 2006.

For use with CIN prevention for emergent cardiac catheterization (unlabeled use): Intravenous formulation (Acetadote®): Administer 1200 mg I.V. push over 5-10 minutes prior to contrast administration.

Administration: OralFor treatment of acetaminophen overdosage, administer orally as a 5% solution. Dilute the 20% solution 1:3 with a cola, orange juice, or other soft drink. Use within 1 hour of preparation. Unpleasant odor becomes less noticeable as treatment progresses. If patient vomits within 1 hour of dose, readminister.

Administration: InhalationAcetylcysteine is incompatible with tetracyclines, erythromycin, amphotericin B, iodized oil, chymotrypsin, trypsin, and hydrogen peroxide. Administer separately. Intermittent aerosol treatments are commonly given when patient arises, before meals, and just before retiring at bedtime.

Storage

Solution for injection (Acetadote®): Store vials at room temperature, 20°C to 25°C (68°F to 77°F). Following reconstitution with D_5W, solution is stable for 24 hours at room temperature. A color change may occur in opened vials (light purple) and does not affect the safety or efficacy.

Solution for inhalation (Mucomyst®): Store unopened vials at room temperature; once opened, store under refrigeration and use within 96 hours. A color change may occur in opened vials (light purple) and does not affect the safety or efficacy.

Reconstitution

Solution for injection (Acetadote®):

Loading dose: Dilute 150 mg/kg in D_5W 200 mL.

Initial maintenance dose: Dilute 50 mg/kg in D_5W 500 mL.

Second maintenance dose: Dilute 100 mg/kg in D_5W 1000 mL.

Note: To avoid fluid overload in patients <40 kg and those requiring fluid restriction, decrease volume of D_5W proportionally. Discard unused portion.

Solution for inhalation (Mucomyst®): The 20% solution may be diluted with sodium chloride or sterile water; the 10% solution may be used undiluted.

Intravenous administration of solution for inhalation (unlabeled route): Using D_5W, dilute acetylcysteine 20% oral solution to a 3% solution.

Compatibility

Inhalation: **Incompatible** with rubber and metals (particularly iron, copper, and nickel); do not mix with ampicillin, tetracycline, oxytetracycline, erythromycin.

Intravenous: **Compatible** with D_5W, $^{1}/_{2}$NS, SWFI. **Incompatible** with rubber and metals (particularly iron, copper, and nickel).

ContraindicationsHypersensitivity to acetylcysteine or any component of the formulation

Warnings/Precautions

Disease-related concerns:

- Acetaminophen overdose: Appropriate use: The modified Rumack-Matthew nomogram allows for stratification of patients into risk categories based on the relationship between the serum acetaminophen level and time after ingestion. There are several situations where the nomogram is of limited use. Serum acetaminophen levels obtained prior to 4-hour postingestion are not interpretable; patients presenting late may have undetectable serum concentrations, but have received a lethal dose. The nomogram is less predictive in a chronic ingestion or in an overdose with an extended release product. Acetylcysteine should be administered for any signs of hepatotoxicity even if acetaminophen serum level is low or undetectable. The nomogram also does not take into account patients at higher risk of acetaminophen toxicity (eg, alcoholics, malnourished patients).

Dosage form specific issues:

- Inhalation: Since increased bronchial secretions may develop after inhalation, percussion, postural drainage, and suctioning should follow. If bronchospasm occurs, administer a bronchodilator; discontinue acetylcysteine if bronchospasm progresses.

- Intravenous: Acute flushing and erythema have been reported; usually occurs within 30-60 minutes and may resolve spontaneously. Serious anaphylactoid reactions have also been reported. Acetylcysteine infusion may be interrupted until treatment of allergic symptoms is initiated; the infusion can then be carefully restarted. Treatment for anaphylactic reactions should be immediately available. Use caution with asthma or history of bronchospasm.

Pregnancy Risk FactorB

Pregnancy ConsiderationsBased on limited reports using acetylcysteine to treat acetaminophen overdose in pregnant women, acetylcysteine has been shown to cross the placenta and may provide protective levels in the fetus.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

Inhalation: Frequency not defined.

Central nervous system: Drowsiness, chills, fever

Gastrointestinal: Vomiting, nausea, stomatitis

Local: Irritation, stickiness on face following nebulization

Respiratory: Bronchospasm, rhinorrhea, hemoptysis

Miscellaneous: Acquired sensitization (rare), clamminess, unpleasant odor during administration

Intravenous:

>10%: Miscellaneous: Anaphylactoid reaction (~17%; reported as severe in 1% or moderate in 10% of patients within 15 minutes of first infusion; severe in 1% or mild to moderate in 6% to 7% of patients after 60-minute infusion)

1% to 10%:

Cardiovascular: Angioedema (2% to 8%), vasodilation (1% to 6%), hypotension (1% to 4%), tachycardia (1% to 4%), syncope (1% to 3%), chest tightness (1%), flushing (1%)

Central nervous system: Dysphoria (<1% to 2%)

Dermatologic: Urticaria (2% to 7%), rash (1% to 5%), facial erythema (≤1%), palmar erythema (≤1%), pruritus (≤1% to 3%), pruritus with rash and vasodilation (2% to 9%)

Gastrointestinal: Vomiting (<1% to 10%), nausea (1% to 10%), dyspepsia (≤1%)

Neuromuscular & skeletal: Gait disturbance (<1% to 2%)

Ocular: Eye pain (<1% to 3%)

Otic: Ear pain (1%)

Respiratory: Bronchospasm (1% to 6%), cough (1% to 4%), dyspnea (<1% to 3%), pharyngitis (1%), rhinorrhea (1%), rhonchi (1%), throat tightness (1%)

Miscellaneous: Diaphoresis (≤1%)

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersAcetaminophen overdose: AST, ALT, bilirubin, PT, serum creatinine, BUN, serum glucose, and electrolytes. Acetaminophen levels at ~4 hours postingestion (every 4-6 hours if extended release acetaminophen; plot on the nomogram) and every 4-6 hours to assess serum levels, and LFTs for possible hepatotoxicity. Assess patient for nausea, vomiting, and skin rash following oral administration for treatment of acetaminophen poisoning. If administered I.V., monitor for anaphylaxis/anaphylactoid reactions.

Reference RangeDetermine acetaminophen level as soon as possible, but no sooner than 4 hours after ingestion (to ensure peak levels have been obtained); administer for acetaminophen level >150 mcg/mL at 4 hours following ingestion; toxic concentration with probable hepatotoxicity: >200 mcg/mL at 4 hours or 50 mcg at 12 hours

Nursing: Physical Assessment/MonitoringInstruct patient on appropriate use, adverse effects to report, and interventions to reduce side effects. Monitor pulmonary function and response to therapy. If giving I.V., monitor for possible anaphylactoid reactions and be prepared to treat appropriately if needed.

Monitoring: Lab TestsAcetaminophen overdose: AST, ALT, bilirubin, PT, serum creatinine, BUN, serum glucose, and electrolytes. Acetaminophen levels at ~4 hours postingestion (every 4-6 hours if extended release acetaminophen; plot on the nomogram) and every 4-6 hours to assess serum levels, and LFTs for possible hepatotoxicity.

Patient EducationPulmonary treatment: Prepare solution (may dilute with sterile water to reduce concentrate from impeding nebulizer) and use as directed. Clear airway by coughing deeply before using aerosol. Wash face and face mask after treatment to remove any residual. You may experience drowsiness (use caution when driving or engaging in tasks requiring alertness), nausea, or vomiting (small, frequent meals may help). Report persistent chills or fever, adverse change in respiratory status, palpitations, or extreme anxiety or nervousness. **Breast-feeding precaution:** Inform prescriber if you are breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Acetadote®: 20% (30 mL) [200 mg/mL; contains disodium edetate]

Solution, inhalation/oral: 10% (4 mL, 10 mL, 30 mL) [100 mg/mL]; 20% (4 mL, 10 mL, 30 mL) [200 mg/mL]

Generic AvailableYes: Solution for inhalation

Mechanism of ActionExerts mucolytic action through its free sulfhydryl group which opens up the disulfide bonds in the mucoproteins thus lowering mucous viscosity. The exact mechanism of action in acetaminophen toxicity is unknown; thought to act by providing substrate for conjugation with the toxic metabolite. The presumed mechanism in preventing contrast-induced nephropathy is its ability to scavenge oxygen-derived free radicals and improve endothelium-dependent vasodilation.

Pharmacodynamics/Kinetics

Onset of action: Inhalation: 5-10 minutes

Duration: Inhalation: >1 hour

Distribution: 0.47 L/kg

Protein binding, plasma: 83%

Half-life elimination:

Reduced acetylcysteine: 2 hours

Total acetylcysteine: Adults: 5.5 hours; Newborns: 11 hours

Time to peak, plasma: Oral: 1-2 hours

Excretion: Urine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis, drowsiness, fever, vomiting, nausea, bronchospasm, rhinorrhea, hemoptysis, and dizziness

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness

Mental Health: Effects on Psychiatric TreatmentSedative effects may be potentiated by psychotropic agents

Cardiovascular Considerations

Contrast-Induced Nephropathy (CIN): Oral: Although study results vary, acetylcysteine may be beneficial in prevention of CIN in patients undergoing cardiac catheterization (Curhan, 2003). Tepel (2000) and his group originally randomized 83 patients with chronic renal insufficiency to oral acetylcysteine (600 mg twice daily) and intravenous saline 0.45% **or** placebo and intravenous saline 0.45%. All patients were having a CT scan with iopromide contrast. Patients receiving acetylcysteine had a significant reduction in serum creatinine 48 hours after the procedure. Conversely, patients in the placebo arm had significant increase in serum creatinine.

A recent randomized, placebo-controlled trial in 200 Chinese patients with stable mild-to-moderate renal insufficiency also evaluated acetylcysteine in prevention of CIN (Kay, 2003). Patients were undergoing elective coronary angiography and/or intervention, and had serum creatinine concentrations >1.2 mg/dL or Cl_{cr} <60 mL/minute (estimated and measured). A low-osmolality nonionic contrast agent was used. All patients received saline 0.9% I.V. at 1 mL/kg/hour for 12 hours before and for 6 hours after contrast exposure. Three doses of acetylcysteine (600 mg twice daily) or matching placebo were given before and one dose after dye exposure. Contrast nephropathy developed more frequently in the control group (12%) than in the acetylcysteine group (4%). The average length of hospitalization was 0.5 days shorter in the acetylcysteine group. No adverse events related to acetylcysteine were reported.

However, these results differed from those in another prospective, randomized trial (Allaqaband, 2002) that compared the efficacy of acetylcysteine (600 mg twice daily for 48 hours) plus saline 0.45% versus fenoldopam (0.1 mcg/kg/minute) plus saline 0.45% versus saline 0.45% alone (at 1 mL/kg/hour for 12 hours before procedure, during procedure, and 12 hours afterwards) in preventing CIN. Patients were high-risk (serum creatinine >1.6 mg/dL or Cl_{cr} <60 mL/minute) and undergoing cardiovascular procedures using low-osmolality nonionic contrast. Authors concluded that there was no benefit in either oral acetylcysteine or fenoldopam over saline in preventing CIN.

Marenzi, et al (2006) showed that acetylcysteine's effect may be dose dependent. Patients with acute MI requiring emergent cardiac catheterization for possible PCI received either high dose acetylcysteine (1200 mg I.V. bolus followed by 1200 mg administered orally twice daily for 48 hours), a low dose regimen (600 mg I.V. bolus followed by 600 mg administered orally twice daily for 48 hours) or placebo. The group that received the high dose regimen developed CIN (defined as an increase in serum creatinine concentration of ≥25% from baseline within 72 hour) less often than the low dose group ($p<0.001$). All patients received saline 0.9% NaCl at 1 mL/kg/hour (0.5 mL/kg/hour for cases of overt heart failure) for 12 hours.

Briguori, et al (2007) evaluated three prophylactic regimens (normal saline and acetylcysteine (NAC); sodium bicarbonate and NAC; normal saline, ascorbic acid and NAC) in 326 patients with chronic kidney disease (serum creatinine ≥2 mg/dL) undergoing coronary and/or peripheral procedures with iodixanol. Saline was given I.V. at 1 mL/kg/hour (0.5 ml/kg/hour for LVEF <40%) for 12 hours before and 12 hours after contrast administration. Sodium bicarbonate administration was similar to that in the Merten trial. The oral NAC dose was 1200 mg twice daily given the day before and the day of contrast administration (4 doses total). The ascorbic acid dose was given I.V. as 3 g 2 hours before the procedure followed by 2 g the night of and the morning after the procedure. The amount of contrast administered and the contrast nephropathy risk scores were similar in each group. Contrast induced nephropathy (CIN) occurred in 9.9% (11/111 of patients) of saline/NAC group, 2% (2/108 of patients) of bicarbonate/NAC group and 10.3 % (11/107 of patients) in saline/NAC/ascorbic acid group. The bicarbonate/NAC group had significantly fewer episodes of CIN when compared to saline/NAC group in this patient population.

Parameters used to define CIN varied among studies.

Contrast-Induced Nephropathy (CIN): I.V.: Several studies have evaluated intravenous acetylcysteine in the prevention of CIN. Three different dosing regimens were used. The initial study (Baker, 2003) randomized patients with stable renal function undergoing cardiac catheterization to intravenous acetylcysteine 150 mg/kg over 30 minutes followed by 50 mg/kg over 4 hours or placebo. The study was stopped when an interim analysis indicated borderline statistical significance ($p= 0.045$). Hydration volumes were different between the groups as well. The mean serum creatinine level in the active treatment group was lower after administration when compared to baseline. Acetylcysteine may have a direct affect on creatinine levels.

Another trial (Webb, 2004) studied 500 mg of intravenous acetylcysteine administered immediately before cardiac catheterization. No significant difference was seen between acetylcysteine and placebo.

Rashid (2004) randomized patients with peripheral vascular disease to 1 g acetylcysteine in 500 mL of normal saline 6-12 hours before and after the procedure. No significant differences were seen in renal function.

Marenzi, et al (2006) evaluated the use of an initial I.V. push dose (high and low dose) of acetylcysteine prior to cardiac catheterization in acute MI patients followed by an oral regimen (high and low dose) compared to placebo. This trial is described above.

Note: Itching, flushing, and rash, as well as more serious allergic reactions, may occur with intravenous acetylcysteine.

⬆ Anesthesia and Critical Care Concerns/Other ConsiderationsIntravenous acetylcysteine may be indicated over oral formulation in treatment of acetaminophen overdose for a restricted number of indications (oral cannot be tolerated; coingested toxin requires ongoing gastrointestinal decontamination; gastrointestinal tract nonfunctional; late presentation of acetaminophen overdose; neonatal toxicity from maternal overdose) (Yip, 1998). A commercially manufactured intravenous product is now available in the United States. If this formulation is unavailable, the product normally administered by inhalation can be administered intravenously. The inhalation preparation is sterile, but not labeled “pyrogen free.” In Yip's retrospective case series, adverse reactions occurred in 4 (~5%) cases. Flushing, pruritus, and phlebitis were reported; one was labeled as an “anaphylactic reaction.”

Bailey and McGuigan reviewed a retrospective case series of patients who received intravenous acetylcysteine and the literature to develop management guideline for anaphylactoid reactions (Bailey, 1998). Their recommendations for treatment of non-life-threatening allergic reactions include reassessing the need for intravenous acetylcysteine, and administering diphenhydramine (1 mg/kg I.V.; maximum dose: 50 mg). If the acetylcysteine infusion was stopped initially and symptoms resolved, consider restarting infusion 1 hour after diphenhydramine's administration. Anaphylactoid reactions have also been reported with the commercial I.V. formulation. Monitor closely for allergic reactions. Be prepared to handle anaphylactoid reaction if it occurs.

Index Terms *N*-Acetyl-L-cysteine; *N*-Acetylcysteine; Acetylcysteine Sodium; Mercapturic Acid; Mucomyst; NAC

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Soriatane® may be confused with Loxitane®

Pronunciation(a si TRE tin)

U.S. Brand NamesSoriatane® CK Convenience Kit™; Soriatane® [DSC]

Canadian Brand NamesSoriatane®

Pharmacologic CategoryRetinoid-Like Compound

Use: Labeled IndicationsTreatment of severe psoriasis

Dosing: Adults

Psoriasis: Oral: Individualization of dosage is required to achieve maximum therapeutic response while minimizing side effects

Initial therapy: Therapy should be initiated at 25-50 mg/day, given as a single dose with the main meal

Maintenance: Doses of 25-50 mg/day may be given after initial response to treatment; the maintenance dose should be based on clinical efficacy and tolerability

Dosing: ElderlyRefer to adult dosing.

Dietary ConsiderationsAdminister with food. Avoid ingestion of additional sources of exogenous vitamin A (in excess of RDA); use of ethanol and ethanol-containing products is contraindicated.

StorageStore between 15°C to 25°C (59°F to 77°F). Avoid high temperatures and humidity. Protect from light.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to acitretin, other retinoids, or any component of the formulation; patients who are pregnant or intend on becoming pregnant; ethanol ingestion; severe hepatic or renal dysfunction; chronically-elevated blood lipid levels; concomitant use with methotrexate or tetracyclines

Acitretin is contraindicated in females of childbearing potential unless all of the following conditions apply.

1) Patient has severe psoriasis unresponsive to other therapy or if clinical condition contraindicates other treatments.

2) Patient must have two negative urine or serum pregnancy tests prior to therapy.

3) Patient must have pregnancy test repeated monthly during therapy. After discontinuation of therapy, a pregnancy test must be repeated every 3 months for at least 3 years.

4) Patient must commit to using two effective forms of birth control starting 1 month prior to acitretin treatment and for 3 years after discontinuation. Prescriber must counsel patient about contraception every month during therapy and every 3 months following discontinuation for at least 3 years.

5) Patient is reliable in understanding and carrying out instructions.

6) Patient has received, and acknowledged, understanding of a careful oral and printed explanation of the hazards of fetal exposure to acitretin and the risk of possible contraception failure; this explanation may include showing a line drawing to the patient of an infant with the characteristic external deformities resulting from retinoid exposure during pregnancy. Patient must sign an agreement/informed consent document stating that she understands these risks and that she should not consume ethanol during therapy or for 2 months after discontinuation.

7) All patients (male and female) should not donate blood during and for 3 years following treatment with acitretin.

Warnings/Precautions

Boxed warnings:

- Blood donation: See “Other warnings/precautions” below.
- Ethanol use: See “Concurrent drug therapy issues” below.
- Hepatotoxicity: See “Concerns related to adverse effects” below.
- Medication guide: See “Other warnings/precautions” below.

- Pregnancy/Do Your P.A.R.T. program: See “Special populations” below.

Concerns related to adverse effects:

- Depression: Depression, including thoughts of self-harm have been reported; use with caution in patients with a history of mental illness.

- Hepatotoxicity: **[U.S. Boxed Warning]: Changes in transaminases occur in up to $^{1}/_{3}$ of patients.** Monitor for hepatotoxicity; discontinue if significant elevations of liver enzymes occur. Use with caution in patients at risk of hypertriglyceridemias.

- Hyperostosis: Patients receiving long-term treatment should be periodically examined for bony abnormalities; if occur risk vs. benefit of therapy should be considered.

- Lipid effects: Lipid changes including, increased triglycerides, increased cholesterol, and decreased HDL are common (up to 66%); increased triglycerides may lead to pancreatitis.

- Photosensitivity: May be photosensitizing; minimize sun or other UV exposure to treated areas.

- Pseudotumor cerebri: Rarely associated with pseudotumor cerebri.

- Visual disturbances: May cause a decrease in night vision or decreased tolerance to contact lenses; discontinue if visual changes occur.

Concurrent drug therapy issues:

- Ethanol use: **[U.S. Boxed Warning]: All patients (male and female) should abstain from ethanol or ethanol-containing products during therapy and for 2 months after discontinuation.**

- Tetracyclines: Pseudotumor cerebri (benign intracranial hypertension) has been reported with use of tetracyclines and acitretin independently; concomitant use is contraindicated.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children; growth potential may be affected.

- Pregnancy/Do Your P.A.R.T. program: **[U.S. Boxed Warning]: Not for use by women who are pregnant or want to become pregnant; patient should not get pregnant for at least 3 years after discontinuation.** The Do Your P.A.R.T. (Pregnancy Prevention Actively Required During and After Treatment) program explains teratogenic risks and requirements expected of females of childbearing potential to prevent pregnancies from occurring during use and 3 years following discontinuation; this should be used to educate patients and healthcare providers.

Other warnings/precautions:

- Blood donation: **[U.S. Boxed Warning]: All patients should be advised not to donate blood during therapy or for 3 years following completion of therapy.**

- Medication guide: **[U.S. Boxed Warning]: All patients must be provided with a medication guide each time acitretin is dispensed. Female patients must also sign an informed consent prior to therapy.**

Pregnancy Risk FactorX

Pregnancy ConsiderationsAcitretin is teratogenic in humans. Severe birth defects have been reported when conception occurred during treatment or after therapy was complete. **[U.S. Boxed Warning]: Not for use by women who want to become pregnant;** patient should not get pregnant for at least 3 years after discontinuation. In addition, because ethanol forms a teratogenic metabolite and would increase the duration of teratogenic potential, ethanol should not be consumed during treatment or for 2 months after discontinuation. Limited amounts of acitretin are found in seminal fluid; although it appears this poses little risk to a fetus, the actual risk of teratogenicity is not known. Any pregnancy which occurs during treatment, or within 3 years after treatment is discontinued, should be reported to the manufacturer at 1-888-500-3376 or to the FDA at 1-800-FDA-1088.

LactationEnters breast milk/not recommended

Breast-Feeding ConsiderationsAcitretin should not be given prior to or during nursing due to the potential for adverse effects in the nursing infant.

Adverse Reactions

>10%:

Central nervous system: Hyperesthesia (10% to 25%)

Dermatologic: Cheilitis (>75%), alopecia (50% to 75%), skin peeling (50% to 75%), dry skin (25% to 50%), nail disorder (25% to 50%), pruritus (25% to 50%), erythematous rash (10% to 25%), skin atrophy (10% to 25%), sticky skin (10% to 25%), paronychia (10% to 25%)

Endocrine & metabolic: Hypercholesterolemia (25% to 50%), hypertriglyceridemia (50% to 75%), HDL decreased (25% to 50%), phosphorus increased (10% to 25%), potassium increased (10% to 25%), sodium increased (10% to 25%), magnesium increased/decreased (10% to 25%), fasting blood sugar increased (25% to 50%), fasting blood sugar decreased (10% to 25%)

Gastrointestinal: Xerostomia (10% to 25%)

Hematologic: Reticulocytes increased (25% to 50%), hematocrit decreased (10% to 25%), hemoglobin decreased (10% to 25%), WBC increased/decreased (10% to 25%), haptoglobin increased (10% to 25%), neutrophils increased (10% to 25%)

Hepatic: Liver function tests increased (25% to 50%), alkaline phosphatase increased (10% to 25%), direct bilirubin increased (10% to 25%), GGTP increased (10% to 25%)

Neuromuscular & skeletal: Paresthesia (10% to 25%), arthralgia (10% to 25%), rigors (10% to 25%), CPK increased (25% to 50%), spinal hyperostosis progression (10% to 25%)

Ocular: Xerophthalmia (10% to 25%),

Renal: Uric acid increased (10% to 25%), acetonuria (10% to 25%), hematuria (10% to 25%), RBC in urine (10% to 25%)

Respiratory: Rhinitis (25% to 50%), epistaxis (10% to 25%)

1% to 10%:

Cardiovascular: Flushing, edema

Central nervous system: Headache, pain, depression, insomnia, somnolence, fatigue

Dermatologic: Skin odor, hair texture change, bullous eruption, dermatitis, diaphoresis increased, psoriasiform rash, purpura, pyogenic granuloma, rash, seborrhea, ulcers, fissures, sunburn

Endocrine & metabolic: Hot flashes, potassium decreased, phosphorus decreased, sodium decreased, calcium increased or decreased, chloride increased or decreased

Gastrointestinal: Gingival bleeding, gingivitis, saliva increased, stomatitis, thirst, ulcerative stomatitis, abdominal pain, diarrhea, nausea, taste disturbance, anorexia, appetite increased, tongue disorder

Hepatic: Total bilirubin increased

Neuromuscular & skeletal: Arthritis, back pain, hypertonia, myalgia, osteodynia, peripheral joint hyperostosis, Bell's palsy

Ocular: Blurred vision, blepharitis, conjunctivitis, night blindness, photophobia, corneal epithelial abnormality, eye pain, eyebrow or eyelash loss, diplopia, cataract

Otic: Earache, tinnitus

Renal: BUN increased, creatinine increased, glycosuria, proteinuria

Respiratory: Sinusitis

<1%: Abnormal gait, acne, anal disorder, anxiety, bleeding time increased, bone disorder, bursitis, chalazion, chest pain, cirrhosis, conjunctival hemorrhage, constipation, corneal ulceration, cough, cyanosis, deafness, diplopia, dizziness, dyspepsia, dysphonia, dysuria, ectropion, eczema, esophagitis, ethanol intolerance, fever, flu-like syndrome, fungal infection, furunculosis, gastritis, gastroenteritis, glossitis, gum hyperplasia, hair discoloration, healing impaired, hemorrhage, hemorrhoids, hepatic dysfunction, hepatitis, hyperkeratosis, hypertrichosis, hypoesthesia, intermittent claudication, itchy eyes, jaundice, lacrimation abnormal, leukorrhea, libido decreased, malaise, melena, migraine, moniliasis, muscle weakness, nervousness, neuritis, olecranon bursitis, papilledema, peripheral ischemia, pharyngitis, photosensitivity, pseudotumor cerebri, recurrent sties, scleroderma, skin hypertrophy, spinal hyperostosis (new lesion), taste loss, tendonitis, tenesmus, tongue ulceration, urticaria, vaginitis, weight gain

Postmarketing and/or case reports: Aggression, MI, myopathy with peripheral neuropathy, nail fragility, pancreatitis, skin fragility or thinning, stroke, suicidal thoughts, thromboembolism, vulvovaginitis

Drug Interactions

Alcohol (Ethyl): May enhance the teratogenic effect of Acitretin. *Risk X: Avoid combination*

Contraceptive (Progestins): Acitretin may diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk X: Avoid combination*

Methotrexate: Acitretin may enhance the hepatotoxic effect of Methotrexate. *Risk X: Avoid combination*

Oral Contraceptive (Estrogens): Retinoic Acid Derivatives may diminish the therapeutic effect of Oral Contraceptive (Estrogens). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. *Risk C: Monitor therapy*

Oral Contraceptive (Progestins): Retinoic Acid Derivatives may diminish the therapeutic effect of Oral Contraceptive (Progestins). Two forms of contraception are recommended in females of child-bearing potential during retinoic acid derivative therapy. *Risk C: Monitor therapy*

Tetracycline Derivatives: May enhance the adverse/toxic effect of Retinoic Acid Derivatives. The development of pseudotumor cerebri is of particular concern. *Risk X: Avoid combination*

Vitamin A: May enhance the adverse/toxic effect of Retinoid-like Compounds. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: Use leads to formation of etretinate, a teratogenic metabolite with a prolonged half-life; concomitant use of ethanol or ethanol-containing products is contraindicated.

Monitoring ParametersLipid profile (baseline and at 1- to 2-week intervals for 4-8 weeks); liver function tests (baseline, and at 1- to 2-week intervals until stable, then as clinically indicated); blood glucose in patients with diabetes; bone abnormalities (with long-term use)

Monitoring: Lab TestsLipid profile (baseline and at 1- to 2-week intervals for 4-8 weeks); liver function tests (baseline, and at 1- to 2-week intervals until stable, then as clinically indicated); blood glucose in patients with diabetes

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule:

Soriatane®: 10 mg [DSC], 25 mg [DSC]

Soriatane® CK Convenience Kit™: 10 mg, 25 mg [packaged with VersaFoam-EF™]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Capsules (Soriatane)

25 mg (30): $607.90

Pharmacodynamics/KineticsEtretinate has been detected in serum for up to 3 years following therapy, possibly due to storage in adipose tissue.

Onset: May take 2-3 months for full effect; improvement may be seen within 8 weeks.

Absorption: Oral: ~72% absorbed when given with food

Protein binding: >99% bound, primarily to albumin

Metabolism: Metabolized to *cis*-acitretin; both compounds are further metabolized. Concomitant ethanol use leads to the formation of etretinate (active).

Half-life elimination: Acitretin: 49 hours (range: 33-96); *cis*-acitretin: 63 hours (range: 28-157); etretinate: 120 days (range: 84-168 days)

Excretion: Feces (34% to 54%); urine (16% to 53%)

Pharmacotherapy PearlsFemale patients are required to use two forms of birth control, at least one of which is a primary form, unless they have undergone a hysterectomy or are postmenopausal. Both forms of birth control must be used simultaneously for at least 1 month prior to therapy and for at least 3 years after discontinuation. Primary forms of birth control include tubal ligation, partner's vasectomy, IUD, or hormonal birth control products. Microdosed progestin products, referred to as “mini-pills,” have been shown to be less effective when used with acitretin, and are not recommended. Secondary forms of contraception include diaphragms, latex condoms and cervical caps, all if used with a spermicide.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

International Brand NamesNeo-Tigason (TH); Neotigason (AR, AT, AU, BB, BE, BF, BG, BJ, BM, BR, BS, BZ, CH, CI, CL, CN, CO, CZ, DE, DK, EC, EE, EG, ET, FI, GB, GH, GM, GN, GR, GY, HN, IE, IL, IT, JM, KE, KP, LR, MA, ML, MR, MU, MW, MX, NE, NG, NL, NO, PE, PH, PL, PT, PY, SC, SD, SE, SL, SN, SR, TN, TT, TW, TZ, UG, UY, VE, ZA, ZM, ZW); Soriatane (FR)

Acrivastine and Pseudoephedrine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(AK ri vas teen & soo doe e FED rin)

U.S. Brand NamesSemprex®-D

Pharmacologic CategoryAlpha/Beta Agonist; Histamine H_1 Antagonist; Histamine H_1 Antagonist, Second Generation

Use: Labeled IndicationsTemporary relief of nasal congestion, decongest sinus openings, running nose, itching of nose or throat, and itchy, watery eyes due to hay fever or other upper respiratory allergies

Dosing: AdultsRhinitis, nasal congestion, allergic symptoms: Oral: 1 capsule 3-4 times/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentDo not use.

ContraindicationsHypersensitivity to pseudoephedrine, acrivastine (or other alkylamine antihistamines), or any component of the formulation; MAO inhibitor therapy within 14 days of initiating therapy; severe hypertension, severe coronary artery disease; renal impairment (Cl_{cr} ≤48 mL/minute)

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (including hypertension and ischemic heart disease); contraindicated with severe disease.
- Diabetes: Use with caution in patients with diabetes mellitus.
- Increased intraocular pressure/glaucoma: Use with caution in patients with increased intraocular pressure or glaucoma.
- Prostatic hyperplasia/urinary obstruction: Use with caution in patients with prostatic hyperplasia and/or GU obstruction.
- Pyloroduodenal obstruction: Use with caution in patients with pyloroduodenal obstruction (including stenotic peptic ulcer).
- Renal impairment: Use with caution in patients with renal impairment; contraindicated if Cl_{cr} ≤48 mL/minute.
- Thyroid dysfunction: Use with caution in patients with thyroid dysfunction.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; may be more sensitive to adverse effects.
- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Pregnancy Risk FactorB

LactationEnters breast milk/contraindicated

Adverse Reactions

>10%: Central nervous system: Drowsiness, headache

1% to 10%:

Cardiovascular: Tachycardia, palpitation

Central nervous system: Nervousness, dizziness, insomnia, vertigo, lightheadedness, fatigue

Gastrointestinal: Nausea, vomiting, xerostomia, diarrhea

Genitourinary: Dysuria

Neuromuscular & skeletal: Weakness

Respiratory: Pharyngitis, cough increased

Miscellaneous: Diaphoresis

<1%: Dysmenorrhea, dyspepsia

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Amphetamines: May diminish the sedative effect of Antihistamines. *Risk C: Monitor therapy*

Antacids: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Aluminum Hydroxide. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor): May enhance the tachycardic effect of Alpha-/Beta-Agonists. Antidepressants (Serotonin/Norepinephrine Reuptake Inhibitor) may enhance the vasopressor effect of Alpha-/Beta-Agonists. *Risk D: Consider therapy modification*

Betahistine: Antihistamines may diminish the therapeutic effect of Betahistine. *Risk C: Monitor therapy*

Bromocriptine: Alpha-/Beta-Agonists may enhance the adverse/toxic effect of Bromocriptine. Including increased blood pressure, ventricular arrhythmias, and seizure. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: May decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Brinzolamide; Dorzolamide. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the hypertensive effect of Alpha-/Beta-Agonists (Indirect-Acting). *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase sedation)
Nursing: Physical Assessment/MonitoringSee individual agent for Pseudoephedrine.
Patient EducationSee individual agent for Pseudoephedrine.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Semprex®-D: Acrivastine 8 mg and pseudoephedrine hydrochloride 60 mg

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Capsules (Semprex-D)

8-60 mg (30): $45.99

Mechanism of ActionRefer to Pseudoephedrine; acrivastine is an analogue of triprolidine and it is considered to be relatively less sedating than traditional antihistamines; believed to involve competitive blockade of H_1-receptor sites resulting in the inability of histamine to combine with its receptor sites and exert its usual effects on target cells

Pharmacodynamics/Kinetics

Pseudoephedrine: See Pseudoephedrine.

Acrivastine:

Metabolism: Minimally hepatic

Time to peak: ~1.1 hours

Excretion: Urine (84%); feces (13%)

Related Information

- Pseudoephedrine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Pseudoephedrine: Xerostomia (normal salivary flow resumes upon discontinuation).
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution since pseudoephedrine is a sympathomimetic amine which could interact with epinephrine to cause a pressor response
Mental Health: Effects on Mental StatusDrowsiness is common; may produce anxiety and insomnia
Mental Health: Effects on Psychiatric TreatmentHypertensive crisis may result with MAO inhibitor; effects of CNS depressants may be lessened

Pronunciation(ay SYE kloe veer)

U.S. Brand NamesZovirax®

Canadian Brand NamesApo-Acyclovir®; Gen-Acyclovir; Nu-Acyclovir; ratio-Acyclovir; Zovirax®

Pharmacologic CategoryAntiviral Agent; Antiviral Agent, Topical

Use: Labeled IndicationsTreatment of genital herpes simplex virus (HSV), herpes labialis (cold sores), herpes zoster (shingles), HSV encephalitis, neonatal HSV, mucocutaneous HSV in immunocompromised patients, varicella-zoster (chickenpox)

Use: Unlabeled/InvestigationalPrevention of HSV reactivation in HIV-positive patients; prevention of HSV reactivation in hematopoietic stem-cell transplant (HSCT); prevention of HSV reactivation during periods of neutropenia in patients with acute leukemia

Use: DentalTreatment of initial and prophylaxis of recurrent mucosal and cutaneous herpes simplex (HSV-1 and HSV-2) infections in immunocompromised patients

Dosing: Adults**Note:** Obese patients should be dosed using ideal body weight

Genital HSV:

I.V.: Immunocompetent: Initial episode, severe: 5 mg/kg every 8 hours for 5-7 days

Oral:

Initial episode: 200 mg every 4 hours while awake (5 times/day) for 10 days (per manufacturer's labeling); 400 mg 3 times/day for 5-10 days has also been reported

Recurrence: 200 mg every 4 hours while awake (5 times/day) for 5 days (per manufacturer's labeling; begin at earliest signs of disease); 400 mg 3 times/day for 5 days has also been reported

Chronic suppression: 400 mg twice daily or 200 mg 3-5 times/day, for up to 12 months followed by re-evaluation (per manufacturer's labeling); 400-1200 mg/day in 2-3 divided doses has also been reported

Topical: Immunocompromised: Ointment: Initial episode: $^1/_2$" ribbon of ointment for a 4" square surface area every 3 hours (6 times/day) for 7 days

Herpes labialis (cold sores): Topical: Apply 5 times/day for 4 days

Herpes zoster (shingles):

Oral: Immunocompetent: 800 mg every 4 hours (5 times/day) for 7-10 days

I.V.: Immunocompromised: 10 mg/kg/dose or 500 mg/m^2/dose every 8 hours for 7 days

HSV encephalitis: I.V.: 10 mg/kg/dose every 8 hours for 10 days (per manufacturer's labeling); 10-15 mg/kg/dose every 8 hours for 14-21 days also reported

Mucocutaneous HSV:

I.V.: Immunocompromised: 5 mg/kg/dose every 8 hours for 7 days (per manufacturer's labeling); dosing for up to 14 days also reported

Oral: Immunocompromised (unlabeled use): 400 mg 5 times a day for 7-14 days

Topical: Ointment: Non-life-threatening, immunocompromised: $^1/_2$" ribbon of ointment for a 4" square surface area every 3 hours (6 times/day) for 7 days

Varicella-zoster (chickenpox): Begin treatment within the first 24 hours of rash onset:

Oral: >40 kg (immunocompetent): 800 mg/dose 4 times a day for 5 days

I.V.: Immunocompromised (unlabeled use): 1500 mg/m^2/day divided every 8 hours or 10 mg/kg/dose every 8 hours for 7-10 days

Prevention of HSV reactivation in HIV-positive patients, for use only when recurrences are frequent or severe (unlabeled use): Oral: 200 mg 3 times/day or

400 mg 2 times/day

Prevention of HSV reactivation in HSCT (unlabeled use): Note: Start at the beginning of conditioning therapy and continue until engraftment or until mucositis resolves (~30 days)

Oral: 200 mg 3 times/day

I.V.: 250 mg/m^2/dose every 12 hours

Bone marrow transplant recipients (unlabeled use): I.V.: Allogeneic patients who are HSV and CMV seropositive: 500 mg/m^2/dose (10 mg/kg) every 8 hours; for clinically-symptomatic CMV infection, consider replacing acyclovir with ganciclovir

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Obese patients should be dosed using ideal body weight

Genital HSV:

I.V.: Children ≥12 years: Refer to adult dosing.

Oral:

Initial episode (unlabeled use): 40-80 mg/kg/day divided into 3-4 doses for 5-10 days (maximum: 1 g/day)

Chronic suppression (unlabeled use; limited data): 80 mg/kg/day in 3 divided doses (maximum: 1 g/day), re-evaluate after 12 months of treatment

Herpes labialis (cold sores): Topical: Children ≥12 years: Refer to adult dosing.

Herpes zoster (shingles): I.V.:

Children <12 years (immunocompromised): 20 mg/kg/dose every 8 hours for 7 days

Children ≥12 years: Refer to adult dosing.

HSV encephalitis: I.V.:

Children 3 months to 12 years: 20 mg/kg/dose every 8 hours for 10 days (per manufacturer's labeling); dosing for 14-21 days also reported

Children ≥12 years: Refer to adult dosing.

Mucocutaneous HSV: I.V.:

Children <12 years (immunocompromised): 10 mg/kg/dose every 8 hours for 7 days

Children ≥12 years: Refer to adult dosing.

Neonatal HSV: I.V.: Neonate: Birth to 3 months: 10 mg/kg/dose every 8 hours for 10 days (manufacturer's labeling); 15 mg/kg/dose or 20 mg/kg/dose every 8 hours for 14-21 days has also been reported

Varicella-zoster (chickenpox): Begin treatment within the first 24 hours of rash onset:

Oral:

Children ≥2 years and ≤40 kg (immunocompetent): 20 mg/kg/dose (up to 800 mg/dose) 4 times/day for 5 days

Children >40 kg: Refer to adult dosing.

I.V.:

Children <1 year (immunocompromised, unlabeled use): 10 mg/kg/dose every 8 hours for 7-10 days

Children ≥1 year: Refer to adult dosing.

Prevention of HSV reactivation in HIV-positive patients, for use only when recurrences are frequent or severe (unlabeled use): Oral: 80 mg/kg/day in 3-4 divided doses

Prevention of HSV reactivation in HSCT (unlabeled use): Note: Start at the beginning of conditioning therapy and continue until engraftment or until mucositis resolves (~30 days): I.V.: 250 mg/m^2/dose every 8 hours or 125 mg/m^2/dose every 6 hours

Bone marrow transplant recipients (unlabeled use): I.V.: Refer to adult dosing.

Dosing: Renal Impairment

Oral:

Cl_{cr} 10-25 mL/minute/1.73 m^2: Normal dosing regimen 800 mg every 4 hours: Administer 800 mg every 8 hours

Cl_{cr} <10 mL/minute/1.73 m^2:

Normal dosing regimen 200 mg every 4 hours, 200 mg every 8 hours, or 400 mg every 12 hours: Administer 200 mg every 12 hours

Normal dosing regimen 800 mg every 4 hours: Administer 800 mg every 12 hours

I.V.:

Cl_{cr} 25-50 mL/minute/1.73 m^2: Administer recommended dose every 12 hours

Cl_{cr} 10-25 mL/minute/1.73 m^2: Administer recommended dose every 24 hours

Cl_{cr} <10 mL/minute/1.73 m^2: Administer 50% of recommended dose every 24 hours

Hemodialysis: Administer dose after dialysis

Continuous ambulatory peritoneal dialysis (CAPD): Administer 50% of normal dose once daily; no supplemental dose needed

Continuous renal replacement therapy (CRRT): Drug clearance is highly dependent on the method of renal replacement, filter type, and flow rate. Appropriate dosing requires close monitoring of pharmacologic response, signs of adverse reactions due to drug accumulation, as well as drug levels in relation to target trough (if appropriate). The following are general recommendations only (based on dialysate flow/ultrafiltration rates of 1 L/hour) and should not supersede clinical judgment:

CVVH or CVVHD/CVVHDF: 5-7.5 mg/kg every 24 hours

Note: The higher dose of 7.5 mg/kg is recommended for infections with CNS involvement (Trotman, 2005).

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics
- Ideal Body Weight: Adults
- Ideal Body Weight: Pediatrics

Administration: I.V.For I.V. infusion only. Avoid rapid infusion. Infuse over 1 hour to prevent renal damage. Maintain adequate hydration of patient. Check for phlebitis and rotate infusion sites.

Administration: I.V. DetailpH: 10.5-11.6 (reconstituted solution)

Administration: OralMay be administered with or without food.

Administration: TopicalNot for use in the eye. Apply using a finger cot or rubber glove to avoid transmission to other parts of the body or to other persons.

Dietary ConsiderationsMay be taken with or without food. Acyclovir 500 mg injection contains sodium ~50 mg (~2 mEq).

Storage

Capsule, tablet: Store at controlled room temperature of 15°C to 25°C (59°F to 77°F); protect from moisture.

Cream, suspension: Store at controlled room temperature of 15°C to 25°C (59°F to 77°F).

Ointment: Store at controlled room temperature of 15°C to 25°C (59°F to 77°F) in a dry place.

Injection: Store powder at controlled room temperature of 15°C to 25°C (59°F to 77°F). Reconstituted solutions remain stable for 12 hours at room temperature. Do not refrigerate reconstituted solutions as they may precipitate. Once diluted for infusion, use within 24 hours.

ReconstitutionPowder for injection: Reconstitute acyclovir 500 mg with SWFI 10 mL; do not use bacteriostatic water containing benzyl alcohol or parabens. For intravenous infusion, dilute to a final concentration ≤7 mg/mL. Concentrations >10 mg/mL increase the risk of phlebitis.

CompatibilityStable in D_5W, D_5NS, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, LR, NS.

Incompatible with blood products and protein-containing solutions.

Y-site administration: Compatible: Allopurinol, amikacin, amphotericin B cholesteryl sulfate complex, ampicillin, cefamandole, cefazolin, cefoperazone, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, clindamycin, co-trimoxazole, dexamethasone, dimenhydrinate, diphenhydramine, docetaxel, doxorubicin liposome, doxycycline, erythromycin lactobionate, etoposide, famotidine, filgrastim, fluconazole, gatifloxacin, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, imipenem/cilastatin, linezolid, lorazepam, magnesium sulfate, melphalan, methylprednisolone sodium succinate, metoclopramide, metronidazole, multivitamins, nafcillin, oxacillin, paclitaxel, penicillin G potassium, pentobarbital, perphenazine, piperacillin, potassium chloride, propofol, ranitidine, remifentanil, sodium bicarbonate, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin, tobramycin, vancomycin, zidovudine. **Incompatible:** Amifostine, amsacrine, aztreonam, cefepime, dobutamine, dopamine, fludarabine, foscarnet, gemcitabine, idarubicin, levofloxacin, ondansetron, piperacillin/tazobactam, sargramostim, vinorelbine. **Variable (consult detailed reference):** Cisatracurium, diltiazem, meperidine, meropenem, morphine, TPN.

Compatibility when admixed: Compatible: Fluconazole. **Incompatible:** Dobutamine, dopamine. **Variable (consult detailed reference):** Meropenem.

ContraindicationsHypersensitivity to acyclovir, valacyclovir, or any component of the formulation

Allergy Considerations

- Antiviral Acyclic Guanine Derivative Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Renal effects: Renal failure (sometimes fatal) has been reported. Dehydration, pre-existing renal disease and nephrotoxic drugs increase risk; infuse over at least 1 hour to reduce risk of renal tubular damage.

- Thrombocytopenic purpura/hemolytic uremic syndrome (TTP/HUS): Has been reported.

Disease-related concerns:

- Varicella-zoster: Appropriate use: Treatment should begin within 24 hours of appearance of rash; oral route not recommended for routine use in otherwise healthy children with varicella, but may be effective in patients at increased risk of moderate to severe infection (>12 years of age, chronic cutaneous or pulmonary disorders, long-term salicylate therapy, corticosteroid therapy).

- Genital herpes: Appropriate use: Physical contact should be avoided when lesions are present; transmission may also occur in the absence of symptoms. Treatment should begin with the first signs or symptoms.

- Herpes labialis: Appropriate use: For external use only to the lips and face; do not apply to eye or inside the mouth or nose. Treatment should begin with the first signs or symptoms.

- Herpes zoster: Appropriate use: Therapy should be started within 72 hours of appearance of rash to be effective.

- Renal impairment: Use with caution in patients with pre-existing renal impairment; dosage adjustments recommended.

Concurrent drug therapy issues:

- Nephrotoxic drugs: Use with caution in patients receiving other nephrotoxic drugs.

Special populations:

- Elderly: Use with caution in the elderly; higher risk for CNS and renal adverse events.

- Immunocompromised patients: Use with caution in immunocompromised patients.

- Pediatrics: Safety and efficacy of oral formulations have not been established in children <2 years of age.

Dosage form specific issues:

- Injection: Use I.V. preparation with caution in patients with underlying neurologic abnormalities, serious hepatic or electrolyte abnormalities, or substantial hypoxia.

Other warnings/precautions:

- Adequate hydration: Maintain adequate hydration during oral or intravenous therapy.

Geriatric ConsiderationsFor herpes zoster, acyclovir should be started within 72 hours of the appearance of the rash to be effective. Dose adjustment may be necessary depending on creatinine clearance.
Pregnancy Risk FactorB
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. Acyclovir has been shown to cross the human placenta. There are no adequate and well-controlled studies in pregnant women. Results from a pregnancy registry, established in 1984 and closed in 1999, did not find an increase in the number of birth defects with exposure to acyclovir when compared to those expected in the general population. However, due to the small size of the registry and lack of long-term data, the manufacturer recommends using during pregnancy with caution and only when clearly needed. Data from the pregnancy registry may be obtained from GlaxoSmithKline.
LactationEnters breast milk/use with caution (AAP rates “compatible”)
Breast-Feeding ConsiderationsNursing mothers with herpetic lesions near or on the breast should avoid breast-feeding. Limited data suggest exposure to the nursing infant of ~0.3 mg/kg/day following oral administration of acyclovir to the mother.
Adverse Reactions

Systemic: Oral:

>10%: Central nervous system: Malaise (12%)

1% to 10%:

Central nervous system: Headache (2%)

Gastrointestinal: Nausea (2% to 5%), vomiting (3%), diarrhea (2% to 3%)

Systemic: Parenteral:

1% to 10%:

Dermatologic: Hives (2%), itching (2%), rash (2%)

Gastrointestinal: Nausea/vomiting (7%)

Hepatic: Liver function tests increased (1% to 2%)

Local: Inflammation at injection site or phlebitis (9%)

Renal: BUN increased (5% to 10%), creatinine increased (5% to 10%), acute renal failure

Topical:

>10%: Dermatologic: Mild pain, burning, or stinging (ointment 30%)

1% to 10%: Dermatologic: Pruritus (ointment 4%), itching

All forms: <1%, postmarketing, and/or case reports: Abdominal pain, aggression, agitation, alopecia, anaphylaxis, anemia, angioedema, anorexia, ataxia, coma, confusion, consciousness decreased, delirium, desquamation, diarrhea, disseminated intravascular coagulopathy (DIC), dizziness, dry lips, dysarthria, encephalopathy, erythema multiforme, fatigue, fever, gastrointestinal distress, hallucinations, hematuria, hemolysis, hepatitis, hyperbilirubinemia, hypotension, insomnia, jaundice, leukocytoclastic vasculitis, leukocytosis, leukopenia, local tissue necrosis (following extravasation), lymphadenopathy, mental depression, myalgia, neutrophilia, paresthesia, peripheral edema, photosensitization, pruritus, psychosis, renal failure, seizure, somnolence, sore throat, Stevens-Johnson syndrome, thrombocytopenia, thrombocytopenic purpura/hemolytic uremic syndrome (TTP/HUS), thrombocytosis, toxic epidermal necrolysis, tremor, urticaria, visual disturbances

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Mycophenolate: Acyclovir-Valacyclovir may increase the serum concentration of Mycophenolate. Mycophenolate may increase the serum concentration of Acyclovir-Valacyclovir. *Risk C: Monitor therapy*

Tenofovir: Acyclovir-Valacyclovir may decrease the excretion of Tenofovir. *Risk C: Monitor therapy*

Zidovudine: Acyclovir-Valacyclovir may enhance the CNS depressant effect of Zidovudine. *Risk C: Monitor therapy*

Zoster Vaccine: Acyclovir-Valacyclovir may diminish the therapeutic effect of Zoster Vaccine. Management: When possible, discontinue antiviral agents with anti-zoster activity (i.e., acyclovir, valacyclovir, famciclovir) for at least 24 hours prior to and 14 days after receiving a live attenuated zoster vaccine. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsFood: Does not affect absorption of oral acyclovir.

Monitoring ParametersUrinalysis, BUN, serum creatinine, liver enzymes, CBC

Nursing: Physical Assessment/MonitoringAssess carefully for use cautions. Assess potential for interactions with other prescriptions, OTC, or herbal medications patient may be taking. Patient should be adequately hydrated during I.V. therapy and monitored closely during intravenous administration. Assess results of laboratory tests, therapeutic effects, and adverse responses according to purpose for use and formulation. Teach patient proper use (if self-administered), possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsUrinalysis, BUN, serum creatinine, liver enzymes, CBC

Patient EducationDo not take any new medication during therapy (including creams, lotions, or ointments) unless approved by prescriber. This is not a cure for herpes (recurrences tend to continually reappear every 3-6 months after original infection), nor will this medication reduce the risk of transmission to others when lesions are present; avoid sexual intercourse when visible lesions are present. Use as directed for full course of therapy; do not discontinue even if feeling better. Oral doses may be taken with food. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); lightheadedness or dizziness (use caution when driving or engaging in tasks that require alertness until response to drug is known); or headache, fever, muscle pain (consult prescriber for approved analgesic). Report any change in urination (difficulty urinating, dark colored or concentrated urine); persistent lethargy; acute headache; severe nausea or vomiting; confusion or hallucinations; rash; or respiratory difficulty.

Topical: Apply as directed. Use gloves or finger cot when applying.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 200 mg

Zovirax®: 200 mg

Cream, topical:

Zovirax®: 5% (2 g, 5 g)

Injection, powder for reconstitution, as sodium: 500 mg, 1000 mg

Injection, solution, as sodium [preservative free]: 50 mg/mL (10 mL, 20 mL)

Ointment, topical:

Zovirax®: 5% (15 g)

Suspension, oral: 200 mg/5 mL (480 mL)

Zovirax®: 200 mg/5 mL (480 mL) [banana flavor]

Tablet: 400 mg, 800 mg

Zovirax®: 400 mg, 800 mg

Generic AvailableYes: Excludes cream, ointment

Tablets (Zovirax)

400 mg (60): $290.80

800 mg (30): $282.81

Mechanism of ActionAcyclovir is converted to acyclovir monophosphate by virus-specific thymidine kinase then further converted to acyclovir triphosphate by other cellular enzymes. Acyclovir triphosphate inhibits DNA synthesis and viral replication by competing with deoxyguanosine triphosphate for viral DNA polymerase and being incorporated into viral DNA.

Pharmacodynamics/Kinetics

Absorption: Oral: 15% to 30%

Distribution: V_d: 0.8 L/kg (63.6 L): Widely (eg, brain, kidney, lungs, liver, spleen, muscle, uterus, vagina, CSF)

Protein binding: 9% to 33%

Metabolism: Converted by viral enzymes to acyclovir monophosphate, and further converted to diphosphate then triphosphate (active form) by cellular enzymes

Bioavailability: Oral: 10% to 20% with normal renal function (bioavailability decreases with increased dose)

Half-life elimination: Terminal: Neonates: 4 hours; Children 1-12 years: 2-3 hours; Adults: 3 hours

Time to peak, serum: Oral: Within 1.5-2 hours

Excretion: Urine (62% to 90% as unchanged drug and metabolite)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Tumor Necrosis Factor: Alpha Blockers Associated with Unrecognized Invasive Fungal Infections - September 4, 2008

The U.S. Food and Drug Administration (FDA) is alerting healthcare professionals of an increased risk for opportunistic fungal infections in patients treated with antitumor necrosis factor (anti-TNF) agents adalimumab (Humira®), certolizumab pegol (Cimzia®), etanercept (Enbrel®), and infliximab (Remicade®). The FDA has received reports of pulmonary and disseminated cases of histoplasmosis, coccidioidomycosis, blastomycosis, and other fungal infections associated with use of these agents. In some cases, the symptoms of fungal infection (eg, fever, cough, malaise, dyspnea, fatigue) were unrecognized and precluded prompt antifungal treatment, resulting in 12 deaths. In response, the FDA is requiring manufacturers of these agents to strengthen the boxed warning statement in the labeling to further emphasize the risk of invasive fungal infection. Patients should be monitored closely for signs and symptoms suggestive of fungal infection, evidence of which should result in prompt discontinuation of the medication and appropriate diagnostic evaluation. Symptomatic patients should be questioned about their residence in or travel from areas of endemic mycoses, which should prompt consideration of empiric antifungal therapy.

Additional information can be found at: http://www.fda.gov/medwatch/safety/2008/safety08.htm#TNF2

Tumor Necrosis Factor (TNF) Blockers and Malignancy Risk - June 5, 2008

The U.S. Food and Drug Administration (FDA) issued an Early Communication to healthcare professionals regarding a possible association between TNF blocker (adalimumab, certolizumb pegol, etanercept, and infliximab) use and the development of malignancies in children and young adults. Over the last 10 years, the FDA has received ~30 reports of cancer in children or young adults who had been treated with TNF blockers prior to the age of 18 years. TNF blockers were given for the treatment of Juvenile Idiopathic Arthritis (JIA [formerly termed Juvenile Rheumatoid Arthritis]), Crohn’s disease, or other indications in combination with other immunosuppressive medications (eg, azathioprine, 6-mercaptopurine or methotrexate). Approximately half of the reported cancers were lymphomas (Hodgkin’s and non-Hodgkin’s), which are cancers involving the cells of the immune system.

TNF blockers work by suppressing the immune system. The prescribing information for each TNF blocker contains warnings regarding the possible association of malignancy development with use. Malignancies may not be detected in short-term studies; long-term studies are necessary to identify the impact of TNF blocker therapy on malignancy development. The manufacturers of the four TNF blockers available in the U.S. are being asked by the FDA to provide information regarding all cases of cancer reported in children taking TNF blockers. The FDA is expected to report its findings in approximately 6 months, after completing a safety review and evaluation.

Additional information is available at http://www.fda.gov/medwatch/safety/2008/safety08.htm#TNF

Medication Safety Issues

Sound-alike/look-alike issues:

Humira® may be confused with Humulin®, Humalog®

Humira® Pen may be confused with HumaPen® Memoir®

Pronunciation(a da LIM yoo mab)

U.S. Brand NamesHumira®

Canadian Brand NamesHumira®

Pharmacologic CategoryAntirheumatic, Disease Modifying; Gastrointestinal Agent, Miscellaneous; Monoclonal Antibody; Tumor Necrosis Factor (TNF) Blocking Agent

Use: Labeled Indications

Treatment of active rheumatoid arthritis (moderate-to-severe) and active psoriatic arthritis; may be used alone or in combination with disease-modifying antirheumatic drugs (DMARDs); treatment of ankylosing spondylitis

Treatment of moderately- to severely-active Crohn’s disease in patients with inadequate response to conventional treatment, or patients who have lost response to or are intolerant of infliximab

Treatment of moderate-to-severe plaque psoriasis

Treatment of moderately- to severely-active juvenile idiopathic arthritis

Dosing: Adults

Rheumatoid arthritis: SubQ: 40 mg every other week; may be administered with other DMARDs; patients not taking methotrexate may increase dose to 40 mg every week

Ankylosing spondylitis, psoriatic arthritis: SubQ: 40 mg every other week

Crohn's disease: SubQ: Initial: 160 mg given as 4 injections on day 1 or over 2 days, then 80 mg 2 weeks later (day 15); Maintenance: 40 mg every other week beginning day 29

Plaque psoriasis: SubQ: Initial: 80 mg as a single dose; maintenance: 40 mg every other week beginning 1 week after initial dose

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Juvenile idiopathic arthritis:** Children ≥4 years: SubQ:

15 kg to <30 kg: 20 mg every other week

≥30 kg: 40 mg every other week

Administration: OtherFor SubQ injection; rotate injection sites. Do not use if solution is discolored. Do not administer to skin which is red, tender, bruised, or hard; rotate injection sites. Needle cap of the prefilled syringe may contain latex.

StorageStore under refrigeration at 2°C to 8°C (36°F to 46°F). Do not freeze. Protect from light.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsThere are no contraindications listed within the FDA-approved labeling.

Canada labeling: Additional contraindications (not in U.S. labeling): Hypersensitivity to adalimumab or any component of the formulation; severe infection (eg, sepsis, tuberculosis, opportunistic infection)

Warnings/Precautions

Boxed warnings:

- Fatal infections: See "Concerns related to adverse effects" below.
- Tuberculosis evaluation: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: May rarely cause hypersensitivity, anaphylaxis, anaphylactoid reactions, or angioedema; medications for the treatment of hypersensitivity reactions should be available for immediate use.
- Autoimmune disorder: Positive antinuclear antibody titers have been detected in patients (with negative baselines). Rare cases of autoimmune disorder, including lupus-like syndrome, have been reported; monitor and discontinue if symptoms develop.
- Fatal infections: **[U.S. Boxed Warning]: Serious and potentially fatal infections (including tuberculosis, invasive fungal and other opportunistic infections) have been reported in patients receiving TNF-blocking agents, including adalimumab.** Cases of unrecognized invasive fungal infections (eg, histoplasmosis, blastomycosis, coccidioidomycosis) have also been reported with anti-TNF agent use. Many of the serious infections have occurred in patients on concomitant immunosuppressive therapy. Other opportunistic infections included *Aspergillus* and *Nocardia*. Caution should be exercised when considering the use in patients with chronic infection, history of recurrent infection, or predisposition to infection (eg, diabetes or residence/travel from areas of endemic mycoses). Do not give to patients with an active chronic or localized infection. Patients who develop a new infection while undergoing treatment should be monitored closely. If a patient develops a serious infection, therapy should be discontinued.
- Hepatitis B: Rare reactivation of hepatitis B virus (HBV) has occurred in chronic virus carriers; evaluate prior to initiation, during, and for several months after treatment. Evaluate patients at risk for HBV infection prior to therapy to determine HBV status.
- Malignancy: Use may affect defenses against malignancies; impact on the development and course of malignancies is not fully defined. A higher incidence of nonmelanoma skin cancers was noted in adalimumab-treated patients (0.9/100 patient years), when compared to the control group (0.3/100 patient years). As compared to the general population, an increased risk of lymphoma has been noted in clinical trials; however, rheumatoid arthritis has been previously associated with an increased rate of lymphoma.
- Pancytopenia: Rare cases of pancytopenia (including aplastic anemia) have been reported with TNF-blocking agents; with significant hematologic abnormalities, consider discontinuing therapy.
- Tuberculosis evaluation: Tuberculosis (disseminated or extrapulmonary) has been reactivated while on adalimumab; most cases have been reported within the first 8 months of treatment. Doses higher than recommended are associated with an increased risk for tuberculosis reactivation. **[U.S. Boxed Warnings]: Patients should be evaluated for latent tuberculosis infection with a tuberculin skin test prior to therapy.** Treatment of latent tuberculosis should be initiated before use. **Patients with initial negative tuberculin skin tests should receive continued monitoring for tuberculosis throughout treatment;** active tuberculosis has developed in this population during treatment. Use with caution in patients who have resided in regions where tuberculosis is endemic

Disease-related concerns:

- Demyelinating CNS disease: Use with caution in patients with pre-existing or recent onset CNS demyelinating disorders; rare cases of optic neuritis and demyelinating disease (new onset or exacerbation) have been reported.
- Heart failure (HF): Use with caution in patients with HF or decreased left ventricular function; worsening and new-onset HF has been

reported.

Dosage form specific issues:

- Latex: The packaging (needle cover of prefilled syringe) may contain latex.
- Polysorbate 80: Product may contain polysorbate 80.

Other warnings/precautions:

- Immunizations: Patients should be brought up to date with all immunizations before initiating therapy; live vaccines should not be given concurrently. There is no data available concerning the effects of therapy on vaccination or secondary transmission of live vaccines in patients receiving therapy.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies, however, there are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if clearly needed. A pregnancy registry has been established to monitor outcomes of women exposed to adalimumab during pregnancy (877-311-8972).

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known whether adalimumab is secreted in human milk. Because many immunoglobulins are secreted in milk and the potential for serious adverse reactions exists, a decision should be made whether to discontinue nursing or discontinue the drug, taking into account the importance of the drug to the mother.

Adverse Reactions

>10%:

Central nervous system: Headache (12%)

Dermatologic: Rash (6% to 12%)

Local: Injection site reaction (12% to 20%; includes erythema, itching, hemorrhage, pain, swelling)

Neuromuscular & skeletal: CPK increased (15%)

Respiratory: Upper respiratory tract infection (17%), sinusitis (11%)

Miscellaneous: Antibodies to adalimumab (3% to 26%; significance unknown), positive ANA (12%)

5% to 10%:

Cardiovascular: Hypertension (5%)

Endocrine & metabolic: Hyperlipidemia (7%), hypercholesterolemia (6%)

Gastrointestinal: Nausea (9%), abdominal pain (7%)

Genitourinary: Urinary tract infection (8%)

Hepatic: Alkaline phosphatase increased (5%)

Local: Injection site reaction (8%; other than erythema, itching, hemorrhage, pain, swelling)

Neuromuscular & skeletal: Back pain (6%)

Renal: Hematuria (5%)

Miscellaneous: Accidental injury (10%), flu-like syndrome (7%)

<5%:

Cardiovascular: Arrhythmia, atrial fibrillation, chest pain, CHF, coronary artery disorder, heart arrest, MI, palpitation, pericardial effusion, pericarditis, peripheral edema, syncope, tachycardia, thrombosis (leg), vascular disorder

Central nervous system: Confusion, fever, hypertensive encephalopathy, multiple sclerosis, subdural hematoma

Dermatologic: Cellulitis, erysipelas

Endocrine & metabolic: Dehydration, menstrual disorder, parathyroid disorder

Gastrointestinal: Diverticulitis, esophagitis, gastroenteritis, gastrointestinal hemorrhage, vomiting

Genitourinary: Cystitis, pelvic pain

Hematologic: Agranulocytosis, granulocytopenia, leukopenia, pancytopenia, paraproteinemia, polycythemia

Hepatic: Cholecystitis, cholelithiasis, hepatic necrosis

Neuromuscular & skeletal: Arthralgia, arthritis, bone fracture, bone necrosis, joint disorder, muscle cramps, myasthenia, pain in extremity, paresthesia, pyogenic arthritis, synovitis, tendon disorder, tremor

Ocular: Cataract

Renal: Kidney calculus, pyelonephritis

Respiratory: Asthma, bronchospasm, dyspnea, lung function decreased, pleural effusion, pneumonia

Miscellaneous: Adenoma, allergic reactions (1%), carcinoma (including breast, gastrointestinal, skin, urogenital), healing abnormality, herpes zoster, ketosis, lupus erythematosus syndrome, lymphoma, melanoma, postsurgical infection, sepsis, tuberculosis (reactivation of latent infection; miliary, lymphatic, peritoneal and pulmonary)

Postmarketing and/or case reports: Anaphylactoid reaction, anaphylaxis, angioneurotic edema, aplastic anemia, cutaneous vasculitis, cytopenia, erythema multiforme, fixed drug eruption, Guillain-Barré syndrome, infections (bacterial, viral, fungal and protozoal), interstitial lung disease (eg, pulmonary fibrosis), intestinal perforation, septic arthritis, thrombocytopenia, transaminases increased, urticaria

Drug Interactions

Abatacept: Anti-TNF Agents may enhance the adverse/toxic effect of Abatacept. An increased risk of serious infection during concomitant use has been reported. *Risk D: Consider therapy modification*

Abciximab: May enhance the potential for allergic or hypersensitivity reactions to Monoclonal Antibodies. Also may cause thrombocytopenia or diminished therapeutic effects. *Risk C: Monitor therapy*

Anakinra: Anti-TNF Agents may enhance the adverse/toxic effect of Anakinra. An increased risk of serious infection during concomitant use has been reported. *Risk X: Avoid combination*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Rilonacept: Anti-TNF Agents may enhance the adverse/toxic effect of Rilonacept. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsHerb/nutraceutical: Echinacea may decrease the therapeutic effects of adalimumab; avoid concurrent use.

Monitoring ParametersPlace and read PPD before initiation. Monitor improvement of symptoms and physical function assessments; CBC; signs of infection, bleeding or bruising.

Nursing: Physical Assessment/MonitoringPerform tuberculin skin test prior to initiating therapy. Monitor for signs of tuberculosis throughout therapy. Do not initiate therapy if active infection (underlying chronic or localized infection) is occurring. Monitor for signs and symptoms of infection. Assess for liver dysfunction. Assess potential for interactions with other prescriptions, OTC medications, and herbal products patient may be taking. Assess results of laboratory tests (PDD), therapeutic effectiveness, and adverse response at regular intervals during treatment. Teach patient proper use if self-injected (appropriate injection technique and syringe/needle disposal), possible side effects/appropriate interventions, and adverse symptoms to report. Latex-sensitive patients: Needle cap of prefilled syringe contains latex.

Monitoring: Lab TestsCBC may be monitored during therapy for hematologic effects.

Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, allergies, history of tuberculosis, or any kind of infection you have. Do not take any new medication during therapy without consulting prescriber. If self-administered, follow directions for injection and needle/syringe disposal exactly. You may be more susceptible to infection. Do not have any vaccinations while using this medication without consulting prescriber first. May cause headache or dizziness (use caution when driving or engaged in potentially hazardous tasks); if persistent, consult prescriber for approved analgesic. Report persistent fever, increased bruising or bleeding, respiratory tract infection, unhealed or infected wounds, urinary tract infection, flu-like symptoms, unexplained weight loss, persistent cough, or unusual bump or sore that does not heal. Stop drug and report immediately persistent nausea, abdominal pain; numbness or tingling; problems with vision; weakness in legs; chest pains, respiratory difficulty; sudden weight gain of >3-5 pounds/week; swelling of extremeties; joint pain; skin rash; redness, swelling, or pain at injection site. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [pediatric; preservative free]:

Humira®: 20 mg/0.4 mL (0.4 mL) [contains polysorbate 80]

Injection, solution [preservative free]:

Humira®: 40 mg/0.8 mL (0.8 mL) [contains polysorbate 80]

Generic AvailableNo

40 mg/0.8 mL (2): $1559.26

Kit (Humira Pen)

40 mg/0.8 mL (2): $1585.92

Mechanism of ActionAdalimumab is a recombinant monoclonal antibody that binds to human tumor necrosis factor alpha (TNF-alpha), thereby interfering with binding to TNFα receptor sites and subsequent cytokine-driven inflammatory processes. Elevated TNF levels in the synovial fluid are involved in the pathologic pain and joint destruction in immune-mediated arthritis. Adalimumab decreases signs and symptoms of psoriatic arthritis, rheumatoid arthritis, and ankylosing spondylitis. It inhibits progression of structural damage of rheumatoid and psoriatic arthritis. Reduces signs and symptoms and maintains clinical remission in Crohn's disease; reduces epidermal thickness and inflammatory cell infiltration in plaque psoriasis.

Pharmacodynamics/Kinetics

Distribution: V_d: 4.7-6 L; Synovial fluid concentrations: 31% to 96% of serum

Bioavailability: Absolute: 64%

Half-life elimination: Terminal: ~2 weeks (range 10-20 days)

Time to peak, serum: SubQ: 131 ± 56 hours

Excretion: Clearance increased in the presence of antiadalimumab antibodies; decreased in patients 40 years and older

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause confusion; may exacerbate pre-existing or recent-onset demyelinating CNS disorder

Mental Health: Effects on Psychiatric TreatmentRare reports of pancytopenia, including aplastic anemia, have been reported with TNF-α-blocking agents. Medically-significant thrombocytopenia and leukopenia have been infrequently reported; use with caution in patients receiving clozapine, carbamazepine, valproic acid, and mirtazapine.

ManufacturerGalderma Laboratories, L.P.

Index TermsBenzoyl Peroxide and Adapalene

Adapalene

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(a DAP a leen)
U.S. Brand NamesDifferin®
Canadian Brand NamesDifferin®; Differin® XP
Pharmacologic CategoryAcne Products; Topical Skin Product, Acne
Use: Labeled IndicationsTreatment of acne vulgaris
Dosing: AdultsAcne: Topical: Apply once daily before bedtime; results appear after 8-12 weeks of therapy.
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricChildren >12 years: Refer to adult dosing.
ContraindicationsHypersensitivity to adapalene or any component in the vehicle gel
Warnings/Precautions

Concerns related to adverse effects:

- Photosensitivity: Use is associated with increased susceptibility/sensitivity to UV light; avoid sunlamps or excessive sunlight exposure. Daily sunscreen use and other protective measures recommended.

- Skin irritation: Certain cutaneous signs and symptoms such as erythema, dryness, scaling, burning, or pruritus may occur during treatment; these are most likely to occur during the first 2-4 weeks and will usually lessen with continued use.

Disease-related concerns:

- Eczema: Use with caution in patients with eczema.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Other warnings/precautions:

- Appropriate use: For external use only; avoid contact with abraded skin, mucous membranes, eyes, mouth, angles of the nose.

Pregnancy Risk FactorC
Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Use only if benefit outweighs the potential risk to fetus.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

>10%: Dermatologic: Erythema, scaling, dryness, pruritus, burning, pruritus or burning immediately after application

≤1%: Skin irritation, stinging, sunburn, acne flares, dermatitis, contact dermatitis, eyelid edema, conjunctivitis, skin discoloration, eczema, rash (topical cream)

Drug Interactions

Vitamin A: May enhance the adverse/toxic effect of Retinoid-like Compounds. *Risk D: Consider therapy modification*

Nursing: Physical Assessment/MonitoringAssess knowledge/teach patient appropriate use and adverse symptoms to report.
Patient EducationApply with gloves in thin film at night to thoroughly clean/dry skin; avoid area around eyes or mouth. Do not apply occlusive dressing. Results may take 8-12 weeks to appear. You may experience transient burning or stinging immediately after applying. Report worsening of condition or skin redness, dryness, peeling, or burning that persists between applications. Avoid excessive exposure to sunlight or sunlamps.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, topical:

Differin®: 0.1% (15 g, 45 g)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(a DEF o veer)

U.S. Brand NamesHepsera™

Canadian Brand NamesHepsera™

Pharmacologic CategoryAntiretroviral Agent, Reverse Transcriptase Inhibitor (Nucleoside)

Use: Labeled IndicationsTreatment of chronic hepatitis B with evidence of active viral replication (based on persistent elevation of ALT/AST or histologic evidence), including patients with lamivudine-resistant hepatitis B

Dosing: AdultsHepatitis B (chronic): Oral: 10 mg once daily. **Note:** Usual treatment duration is at least 1 year and varies with HBeAg status, consult current guidelines and literature.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricHepatitis B (chronic): Oral: Children ≥12 years: Refer to adult dosing.

Dosing: Renal ImpairmentAdult recommendations only (no dosage adjustment recommendations available for patients <18 years with renal impairment):

Cl_{cr} ≥50 mL/minute: No dosage adjustment necessary

Cl_{cr} 30-49 mL/minute: 10 mg every 48 hours

Cl_{cr} 10-29 mL/minute: 10 mg every 72 hours

Hemodialysis: 10 mg every 7 days (following dialysis)

Dosing: Hepatic ImpairmentNo adjustment required.

Calculations

- Creatinine Clearance: Adults

Administration: OralMay be administered without regard to food.

Dietary ConsiderationsMay be taken without regard to food.

StorageStore controlled room temperature of 25°C (77 °F).

ContraindicationsHypersensitivity to adefovir or any component of the formulation

Allergy Considerations

- Adefovir Allergy

Warnings/Precautions

Boxed warnings:

- Chronic hepatitis B: See “Disease-related concerns” below.
- Human immunodeficiency virus (HIV): See “Disease-related concerns” below.
- Lactic acidosis/hepatomegaly: See “Concerns related to adverse effects” below.
- Renal impairment: See “Disease-related concerns” below.

Concerns related to adverse effects:

- Lactic acidosis/hepatomegaly: **[U.S Boxed Warning]: Lactic acidosis and severe hepatomegaly with steatosis have been reported with nucleoside analogues, including fatal cases;** use with caution in patients with risk factors for liver disease (risk may be increased with female gender, obesity, pregnancy or prolonged exposure) and suspend treatment in any patient who develops clinical or laboratory findings suggestive of lactic acidosis or hepatotoxicity (transaminase elevation may/may not accompany hepatomegaly and steatosis).

Disease-related concerns:

- Chronic hepatitis B: **[U.S. Boxed Warning]: Severe, acute exacerbation of hepatitis B may occur upon discontinuation.** Exacerbations may occur in up to 25% of patients and usually within 12 weeks and may be self-limited or resolve upon resuming treatment; risk may be increased with advanced liver disease or cirrhosis. Monitor liver function several months after stopping treatment; reinitiation of antihepatitis B therapy may be required.

    Resistant hepatitis B virus (HBV): In patients with lamivudine-resistant HBV, switching to adefovir was associated with a higher risk of adefovir-resistance compared to adding adefovir to lamivudine therapy (Lok, 2007).

    Nonresponse to adefovir monotherapy (<2 log drop in HBV DNA after 6 months of treatment): Consider alternative treatment (Lok, 2007).

- HIV: **[U.S. Boxed Warning]:May cause the development of HIV resistance in chronic hepatitis B patients with unrecognized or untreated HIV infection.** Determine HIV status prior to initiating treatment with adefovir.

- Renal impairment: **[U.S. Boxed Warning]: Use with caution in patients with renal dysfunction or in patients at risk of renal toxicity (including concurrent nephrotoxic agents or NSAIDs).** Chronic administration may result in nephrotoxicity. Dosage adjustment is required in adult patients with renal dysfunction or in patients who develop renal dysfunction during therapy; no data available for use in children ≥12 years or adolescents with renal impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <12 years of age.

Pregnancy Risk FactorC
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Use in pregnancy only when clearly needed. Pregnant women exposed to adefovir should be registered with the pregnancy registry (800-258-4263).
LactationExcretion in breast milk unknown/not recommended
Adverse Reactions
>10%:

Central nervous system: Headache (24% to 25%)

Gastrointestinal: Abdominal pain (15% to 18%), diarrhea (up to 13%)

Hepatic: Hepatitis exacerbation (up to 25% within 12 weeks of adefovir discontinuation)

Neuromuscular & skeletal: Weakness (13% to 25%)

Renal: Hematuria (grade ≥3: 11%)

1% to 10%:

Dermatologic: Rash, pruritus

Endocrine & metabolic: Hypophosphatemia (<2 mg/dL: 1% and 3% in pre-/post-liver transplant patients, respectively)

Gastrointestinal: Flatulence (up to 8%), dyspepsia (5% to 9%), nausea, vomiting

Renal: Serum creatinine increased (≥0.5 mg/dL: 2% to 3% in compensated liver disease; incidence may be higher in patients with decompensated cirrhosis or in liver transplant recipients), renal failure

Note: In liver transplant patients with baseline renal dysfunction, frequency of increased serum creatinine has been observed to be as high as 32% to 51% at 48 and 96 weeks post-transplantation, respectively; considering the concomitant use of other potentially nephrotoxic medications, baseline renal insufficiency, and predisposing comorbidities, the role of adefovir in these changes could not be established.

Respiratory: Cough (6% to 8%), rhinitis (up to 5%)

Postmarketing and/or case reports: Fanconi syndrome, hepatitis, myopathy, nephrotoxicity, osteomalacia

Drug Interactions

Ganciclovir-Valganciclovir: May enhance the adverse/toxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Hematologic toxicity is of specific concern. *Risk D: Consider therapy modification*

Ribavirin: May enhance the hepatotoxic effect of Reverse Transcriptase Inhibitors (Nucleoside). Lactic acidosis may occur. *Risk D: Consider therapy modification*

Tenofovir: Adefovir may diminish the therapeutic effect of Tenofovir. Specifically, adefovir-associated mutations in Hepatitis B viral reverse transcriptase may decrease viral susceptibility to tenofovir. Tenofovir may increase the serum concentration of Adefovir. Similarly, Adefovir may increase the concentration of Tenofovir. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: Should be avoided in hepatitis B infection due to potential hepatic toxicity.

Food: Does not have a significant effect on adefovir absorption.

Monitoring ParametersHIV status (prior to initiation of therapy); serum creatinine (prior to initiation and during therapy; every 3 months in patients with medical conditions which predispose to renal insufficiency and in all patients treated for >1 year; more frequent monitoring required if preexisting real insufficiency detected [Lok, 2007]); viral load; LFTs for several months following discontinuation of adefovir
Nursing: Physical Assessment/MonitoringUse with caution in presence of renal dysfunction or risk of renal toxicity. Assess other pharmacological or herbal products patient may be taking for potential interactions or toxicity (especially any nephrotoxic agents). Assess results of laboratory tests, patient response (viral load), and adverse reactions (eg, lactic acidosis, altered hepatic status) on a regular basis throughout therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.
Monitoring: Lab TestsHIV status (prior to initiation of therapy); serum creatinine (prior to initiation and during therapy; every 3 months in patients with medical conditions which predispose to renal insufficiency and in all patients treated for >1 year; more frequent monitoring required if preexisting real insufficiency detected [Lok, 2007]); viral load; LFTs for several months following discontinuation of adefovir
Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. Use

appropriate precautions to prevent spread to other persons. Take as directed. Do not discontinue medication without consulting prescriber. You will require frequent blood tests; follow recommended schedule. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may be more susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause headache or abdominal pain (consult prescriber for approved analgesia); or nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report unusual bleeding (blood in urine, tarry stools, or easy bruising); unresolved nausea or vomiting; signs of infection (eg, fever, chills, sore throat, burning urination, flu-like symptoms); persistent fatigue; muscle weakness; changes in urinary pattern; or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as dipivoxil:

Hepsera®: 10 mg

Generic AvailableNo

ManufacturerGilead Sciences Inc

Pricing: U.S. (www.drugstore.com)

Tablets (Hepsera)

10 mg (30): $753.68

Mechanism of ActionAcyclic nucleotide reverse transcriptase inhibitor (adenosine analog) which interferes with HBV viral RNA-dependent DNA polymerase resulting in inhibition of viral replication.

Pharmacodynamics/Kinetics

Distribution: 0.35-0.39 L/kg

Protein binding: ≤4%

Metabolism: Prodrug; rapidly converted to adefovir (active metabolite) in intestine

Bioavailability: 59%

Half-life elimination: 7.5 hours; prolonged in renal impairment

Time to peak: 1.75 hours

Excretion: Urine (45% as active metabolite within 24 hours)

Pharmacotherapy PearlsAdefovir dipivoxil is a prodrug, rapidly converted to the active component (adefovir). It was previously investigated as a treatment for HIV infections (at dosages substantially higher than the approved dose for hepatitis B). The NDA was withdrawn, and no further studies in the treatment of HIV are anticipated (per manufacturer).

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentChronic administration may cause nephrotoxicity. In patients receiving lithium, gabapentin, or levetiracetam, a dosage adjustment may be needed; monitor.

Index TermsAdefovir Dipivoxil; Bis-POM PMEA

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(a DEN oh seen)

U.S. Brand NamesAdenocard®; Adenoscan®

Canadian Brand NamesAdenocard®; Adenoscan®; Adenosine Injection, USP

Pharmacologic CategoryAntiarrhythmic Agent, Class IV; Diagnostic Agent

Use: Labeled Indications

Adenocard®: Treatment of paroxysmal supraventricular tachycardia (PSVT) including that associated with accessory bypass tracts (Wolff-Parkinson-White syndrome); when clinically advisable, appropriate vagal maneuvers should be attempted prior to adenosine administration; **not effective in atrial flutter, atrial fibrillation, or ventricular tachycardia**

Adenoscan®: Pharmacologic stress agent used in myocardial perfusion thallium-201 scintigraphy

Use: Unlabeled/InvestigationalAdenoscan®: Acute vasodilator testing in pulmonary artery hypertension

Dosing: Adults

Paroxysmal supraventricular tachycardia (Adenocard®): I.V. (rapid - over 1-2 seconds, via peripheral line): 6 mg; if not effective within 1-2 minutes, 12 mg may be given; may repeat 12 mg bolus if needed; maximum single dose: 12 mg.

Follow each I.V. bolus of adenosine with normal saline flush.

Note: Preliminary results in adults suggest adenosine may be administered via a central line at lower doses (ie, initial adult dose: 3 mg).

Pharmacologic stress agent (Adenoscan®): I.V.: Continuous I.V. infusion via peripheral line: 140 mcg/kg/minute for 6 minutes using syringe or columetric infusion pump; total dose: 0.84 mg/kg. Thallium-201 is injected at midpoint (3 minutes) of infusion.

Acute vasodilator testing (unlabeled use) (Adenoscan®): I.V.: Initial: 50 mcg/kg/minute increased by 50 mcg/kg/minute every 2 minutes to a maximum dose of 500 mcg/kg/minute; acutely assess vasodilator response

Dosing: ElderlyRefer to adult dosing. Elderly may be more sensitive to effects of adenosine.

Dosing: Pediatric

Paroxysmal supraventricular tachycardia (Adenocard®): Rapid I.V. push (over 1-2 seconds) via peripheral line: Infants and Children (manufacturer's recommendation):

Children <50 kg: 0.05-0.1 mg/kg. If conversion of PSVT does not occur within 1-2 minutes, may increase dose by 0.05-0.1 mg/kg. May repeat until sinus rhythm is established or to a maximum single dose of 0.3 mg/kg or 12 mg. Follow each dose with normal saline flush.

Children ≥50 kg: Refer to adult dosing.

Pediatric advanced life support (PALS): Treatment of SVT: I.V., I.O.: 0.1 mg/kg; if not effective, administer 0.2 mg/kg; maximum single dose: 12 mg. Follow each dose with normal saline flush.

Dosing: Renal Impairment

Hemodialysis: Significant drug removal is unlikely based on physiochemical characteristics.

Peritoneal dialysis: Significant drug removal is unlikely based on physiochemical characteristics.

Note: Higher doses may be needed for administration via peripheral versus central vein.

Administration: I.V.For rapid bolus I.V. use only. Administer I.V. push over 1-2 seconds at a peripheral I.V. site as proximal as possible to trunk (ie, not in lower arm, hand, lower leg, or foot). If administered into an I.V. line, administer as close to the patient's heart as possible (followed by saline flush).

Administration: I.V. DetailDo not mix with any other drugs in syringe or solution.

Dietary ConsiderationsAvoid dietary caffeine for 12-24 hours prior to pharmacologic stress testing.

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F). Do **not** refrigerate; precipitation may occur (may dissolve by warming to room temperature).

CompatibilityStable in D_5LR, D_5W, LR, NS.

ContraindicationsHypersensitivity to adenosine or any component of the formulation; second- or third-degree AV block or sick sinus syndrome (except in patients with a functioning artificial pacemaker), atrial flutter, atrial fibrillation, and ventricular tachycardia (this drug is not effective in converting these arrhythmias to sinus rhythm). The manufacturer states that Adenoscan® should be avoided in patients with known or suspected bronchoconstrictive or bronchospastic lung disease.

Warnings/Precautions

Concerns related to adverse effects:

- Atrial fibrillation/flutter: There have been reports of atrial fibrillation/flutter in patients with paroxysmal supraventricular tachycardia (PSVT) associated with accessory conduction pathways after adenosine. Does not convert afib/flutter to normal sinus rhythm; risk of serious arrhythmias/hypotension. Not for use in patients with afib/flutter associated with Wolff-Parkinson-White Syndrome.

- Conduction disturbances: Adenosine decreases conduction through the AV node and may produce first-, second-, or third-degree heart block. Patients with pre-existing S-A nodal dysfunction may experience prolonged sinus pauses after adenosine; use caution in patients with first-degree AV block or bundle branch block; avoid use of adenosine for pharmacologic stress testing in patients with high-grade AV block or sinus node dysfunction (unless a functional pacemaker is in place). Rare, prolonged episodes of asystole have been reported, with fatal outcomes in some cases.

- Hypotension: May produce profound vasodilation with subsequent hypotension. When used as a bolus dose (PSVT), effects are generally self-limiting (due to the short half-life of adenosine). However, when used as a continuous infusion (pharmacologic stress testing), effects may be more pronounced and persistent, corresponding to continued exposure. Use infusions with caution in patients with autonomic dysfunction, carotid stenosis (with cerebrovascular insufficiency), uncorrected hypovolemia, pericarditis, pleural effusion and/or stenotic valvular heart disease.

- Proarrhythmic effects: Watch for proarrhythmic effects; monitor and adjust dose to prevent QT_c prolongation.

Disease-related concerns:

- Asthma: A limited number of patients with asthma have received adenosine and have not experienced exacerbation of their asthma. Adenosine may cause bronchoconstriction in patients with asthma; should be used cautiously in patients with obstructive lung disease not associated with bronchoconstriction (eg, emphysema, bronchitis).

- Electrolyte imbalance: Correct electrolyte disturbances, especially hypokalemia or hypomagnesemia, prior to use and throughout therapy.

Concurrent drug therapy issues:

- Caffeine: Pharmacologic stress testing: Withhold for five half-lives prior to adenosine use; avoid dietary caffeine for 12-24 hours prior to pharmacologic stress testing.

- Drugs which slow AV conduction: Use with caution in patients receiving other drugs which slow AV conduction (eg, digoxin, verapamil).

- Theophylline: Withhold for five half-lives prior to adenosine use whenever possible (eg, pharmacological stress testing).

Special populations:

- Elderly: Use with caution in the elderly; may be at increased risk of hemodynamic effects, bradycardia, and/or AV block.

Dosage form specific issues:

- Adenocard®: Transient AV block is expected. When used in PSVT, at the time of conversion to normal sinus rhythm, a variety of new rhythms may appear on the ECG. Administer as a rapid bolus, either directly into a vein or (if administered into an I.V. line), as close to the patient as possible (followed by saline flush).

Other warnings/precautions:

- CAST trial: In the Cardiac Arrhythmia Suppression Trial (CAST), recent (>6 days but <2 years ago) myocardial infarction patients with asymptomatic, non-life-threatening ventricular arrhythmias did not benefit and may have been harmed by attempts to suppress the arrhythmia with flecainide or encainide. An increased mortality or nonfatal cardiac arrest rate (7.7%) was seen in the active treatment group compared with patients in the placebo group (3%). The applicability of the CAST results to other populations is unknown. Antiarrhythmic agents should be reserved for patients with life-threatening ventricular arrhythmias.

Geriatric ConsiderationsElderly patients may be more sensitive to the effects of this medication.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReports of administration during pregnancy have indicated no adverse effects on fetus or newborn attributable to adenosine.

LactationExcretion in breast milk unknown

Adverse Reactions**Note:** Frequency varies based on use; higher frequency of infusion-related effects, such as flushing and lightheadedness, were reported with continuous infusion (Adenoscan®).

>10%:

Cardiovascular: Facial flushing (18% to 44%)

Central nervous system: Headache (2% to 18%), lightheadedness (2% to 12%)

Neuromuscular & skeletal: Discomfort of neck, throat, jaw (<1% to 15%)

Respiratory: Dyspnea (12% to 28%), chest pressure/discomfort (7% to 40%)

1% to 10%:

Cardiovascular: Hypotension (<1% to 2%), AV block (infusion 6%; third degree <1%), ST segment depression (3%), palpitation, chest pain

Central nervous system: Dizziness, nervousness (2%), apprehension

Gastrointestinal: Nausea (3%)

Neuromuscular & skeletal: Upper extremity discomfort (up to 4%), numbness (up to 2%), paresthesia (up to 2%)

Respiratory: Hyperventilation

Miscellaneous: Diaphoresis

<1% (Limited to important or life-threatening): Back discomfort, burning sensation, blurred vision, intracranial pressure increased, metallic taste, pressure in groin

Postmarketing and/or case reports: Asystole (prolonged), atrial fibrillation, bradycardia, bronchospasm, hypertension (transient), injection site reaction, respiratory arrest, seizure, torsade de pointes, ventricular fibrillation, ventricular tachycardia

Drug Interactions

Dipyridamole: May enhance the therapeutic effect of Adenosine. Dose reduction of adenosine may be needed. *Risk D: Consider therapy modification*

Nicotine: May enhance the AV-blocking effect of Adenosine. Nicotine may enhance the tachycardic effect of Adenosine. *Risk C: Monitor therapy*

Theophylline Derivatives: May diminish the therapeutic effect of Adenosine. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Avoid food or drugs with caffeine. Adenosine's therapeutic effect may be decreased if used concurrently with caffeine. Avoid dietary caffeine for 12-24 hours prior to pharmacologic stress testing.

Monitoring ParametersECG monitoring, heart rate, blood pressure

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Requires use of infusion pump and continuous cardiac and hemodynamic monitoring during infusion. Monitor for adverse reactions. Note that adenosine could produce bronchoconstriction in patients with asthma.

Patient EducationAdenosine is administered in emergencies; patient education should be appropriate to the situation. May cause facial flushing. Report chest pain or pressure, difficulty breathing immediately. **Pregnancy precautions:** Inform prescriber if you are pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]: 3 mg/mL (2 mL, 4 mL)

Adenocard®: 3 mg/mL (2 mL, 4 mL)

Adenoscan®: 3 mg/mL (20 mL, 30 mL)

Generic AvailableYes

ManufacturerFujisawa Healthcare, Inc

Mechanism of ActionSlows conduction time through the AV node, interrupting the re-entry pathways through the AV node, restoring normal sinus rhythm

Pharmacodynamics/Kinetics

Onset of action: Rapid

Duration: Very brief

Metabolism: Blood and tissue to inosine then to adenosine monophosphate (AMP) and hypoxanthine

Half-life elimination: <10 seconds

Related Information

- Antiarrhythmic Drugs

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDizziness is common; may cause nervousness, anxiety, drowsiness, or emotional instability

Mental Health: Effects on Psychiatric TreatmentUse caution with carbamazepine and tricyclic antidepressants, may increase heart block. Postmarking experience reports seizures as a potential adverse reaction. Psychotropics have the potential to lower seizure threshold. Monitor for seizure activity.

Cardiovascular ConsiderationsAdenosine may be effective in interrupting re-entrant tachycardias, both AV-nodal re-entrant tachycardias and supraventricular tachycardias secondary to accessory pathways. Adenosine acts via interruption of AV-nodal conduction and, when used for this purpose, requires administration as rapid intravenous push in increasing doses. Because of more direct access when administered through a central line, lower doses of adenosine may be tried in these situations. It is not uncommon to see heart block and sinus pause soon after adenosine administration. Cardiac denervation after cardiac transplantation may cause patients to be hypersensitive to the effects of adenosine. Patients will often experience shortness of breath and/or chest pain having unknown etiology. While adenosine will not convert atrial fibrillation or atrial flutter, the consequent AV-nodal conduction slowing (reduced ventricular rate), in this setting, may aid in the identification of the arrhythmia by making the atrial fibrillation or flutter electrocardiographic morphology more apparent.

Pulmonary Artery Hypertension: Patients with pulmonary artery hypertension who respond acutely to vasodilators have improved survival with the long-term use of a calcium channel blocker.

Anesthesia and Critical Care Concerns/Other ConsiderationsShort action is an advantage; has prolonged effects in patients taking dipyridamole or carbamazepine and in denervated transplanted hearts; adjust doses or choose alternative agent accordingly.

Adenosine acts via interruption of AV-nodal conduction and, when used for this purpose, requires administration as rapid intravenous push in increasing doses. Because of more direct access when administered through a central line, lower doses of adenosine may be tried in these situations. It is not uncommon to see heart block and sinus pause soon after adenosine administration. May aid in the identification of the arrhythmia by making the atrial fibrillation or flutter electrocardiographic morphology more apparent.

Agalsidase Alfa

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Agalsidase alfa may be confused with agalsidase beta, alglucerase, alglucosidase alfa

Pronunciation(aye GAL si days AL fa)

Canadian Brand NamesReplagal™

Pharmacologic CategoryEnzyme

Use: Labeled IndicationsReplacement therapy for Fabry disease

Dosing: Adults**Note:** Premedication with oral antihistamines and corticosteroids may alleviate infusion-related reactions associated with agalsidase alfa.

Fabry disease: I.V.: 0.2 mg/kg every 2 weeks

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Premedication with oral antihistamines and corticosteroids may alleviate infusion-related reactions associated with agalsidase alfa.

Fabry disease: Refer to adult dosing.

Dosing: Renal ImpairmentNo dosage adjustment necessary.

Dosing: Hepatic ImpairmentNo data available.

Administration: I.V.Infuse over 40 minutes using a dedicated I.V. line with filter. Do not infuse other agents through same I.V. line. Interrupt infusion in the presence of infusion-related reactions (eg, chills, flushing, dyspnea, rigors, tachycardia, urticaria). Infusion may be restarted after 5-10 minutes if symptoms subside or after administration of analgesics, antipyretics, antihistamines, and/or corticosteroids.

StorageStore vials between 2°C to 8°C (36°F to 46°F). Product is preservative free. Administration within 3 hours after dilution is recommended, however, diluted solution is stable for 24 hours at 25°C (77°).

ReconstitutionTo make final infusion, add the desired amount of solution (based on patient weight) to 100 mL NS. Mix gently and avoid shaking. Discard unused product.

CompatibilityStable in NS. Do not mix or infuse with other products.

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to agalsidase alfa or any component of the formulation; concomitant use with chloroquine, amiodarone, monobenzone, or gentamicin (these agents have the potential to inhibit intracellular agalsidase alfa activity)

Warnings/Precautions

Concerns related to adverse effects:

- Antibody formation: The presence IgG antibodies has been observed within 3 months from the onset of therapy in ~55% of treated patients. Approximately 60% of these patients are free of antibodies and >80% demonstrate immune tolerance, based on reduced titers of antibody within 12-18 months.

- Infusion reactions: Mild acute reactions (chills, facial flushing) are common and may occur during or within 1 hour after infusion. Severe reactions (nausea, pyrexia, rigors, tachycardia, urticaria, vomiting) are rare and usually occur within 2-4 months from the onset of therapy. Patients with a history of reactions may be premedicated with oral corticosteroids and antihistamines 1-3 hours prior to subsequent infusions.

Disease-related concerns:

- Fabry disease: Common symptoms observed in this patient population may be confused with adverse reactions related to treatment.

- Hepatic impairment: Safety and efficacy have not been established.

Pregnancy ConsiderationsAdverse events were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women. The benefits versus risks should be considered carefully before initiating agalsidase alfa therapy in pregnant women.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions**Note:** The most common and serious adverse reactions are infusion reactions (symptoms may include chills, dyspnea, facial flushing, fever, hypertension, nausea, rigors, tachycardia, urticaria, and vomiting).

>10%:

Cardiovascular: Flushing (24%)

Central nervous system: Fever (20%), headache (11%)

Neuromuscular & skeletal: Rigors (20%)

Miscellaneous: IgG antibody formation (55%), infusion-related reactions (13%)

1% to 10%:

Cardiovascular: Chest tightness (7%), hypertension (4%), tachycardia (4%), chest pain (2%), edema (2%), peripheral coldness (2%), peripheral edema (2%)

Central nervous system: Dizziness (9%), fatigue (9%), fatigue aggravated (7%), hypersomnia (2%), hypoesthesia (2%), panic attack (2%), pain/discomfort (7%), somnolence (2%), vertigo (2%)

Dermatologic: Acne (9%), erythema (7%), mottled skin(4%), pruritus (4%), dry skin (2%), eczema (2%), rash (2%)

Gastrointestinal: Nausea (9%), dysgeusia (6%), diarrhea (4%), vomiting (4%), abdominal pain (2%), dyspepsia (2%), gastrointestinal upset (2%), stomach cramps (2%), stomach discomfort (2%)

Neuromuscular & skeletal: Myalgia (6%), neuropathic pain (6%), tremor (4%), musculoskeletal discomfort (2%), back pain (2%), limb pain (2%), paraesthesia (2%), weakness (2%)

Ocular: Lacrimation increased (2%), periorbital edema (2%)

Respiratory: Hoarseness (6%), throat tightness (6%), cough (4%), dyspnea (4%), nasopharyngitis (4%), pharyngitis (4%), nasal congestion (2%), snoring (2%), throat irritation (2%)

Miscellaneous: Feeling hot (4%), influenza-like syndrome(2%), parosmia (2%)

<1%, postmarketing, and/or case reports: Chills, facial flushing, urticaria

Drug Interactions

Amiodarone: May inhibit the intracellular activity of agalsidase alfa; concomitant use is contraindicated.

Chloroquine: May inhibit the intracellular activity of agalsidase alfa; concomitant use is contraindicated.

Gentamicin: May inhibit the intracellular activity of agalsidase alfa; concomitant use is contraindicated.

Monobenzone: May inhibit the intracellular activity of agalsidase alfa; concomitant use is contraindicated.

Monitoring ParametersCreatinine clearance, ECG, echocardiography, Gb-3 levels (serum and urine)

Nursing: Physical Assessment/MonitoringAssess patient for previous experience with enzyme replacement therapy prior to beginning therapy. Assess risk potential for interactions with other prescriptions or herbal products patient may be taking. Note specific dosing information in product labeling. Premedication with antipyretics or corticosteroids for patients with previous infusion reactions is recommended. Patient should be monitored for infusion reactions during and following infusions. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Patient EducationThis medication can only be administered by infusion; you will be closely monitored during infusion. Report immediately unusual acute pain; difficulty breathing or chest tightness; vomiting; difficulty swallowing; itching or rash; or redness, swelling, or pain at infusion site. Between treatments, maintain adequate hydration (2-3 L/day of fluids, unless instructed to restrict fluid intake) and nutrition (small frequent meals). You may experience abdominal discomfort or vomiting (small, frequent meals and good mouth care may help); headache, fatigue, or dizziness (use caution when driving or engaging in tasks that require alertness until response to medication is known); limb, back, or muscle pain (consult prescriber for appropriate analgesia). Report chest discomfort, palpitations, rapid heart beat, or acute headache; signs of infection or rash; swelling of limbs or significant weight increase; difficulty breathing or chest tightness; persistent gastrointestinal discomfort or vomiting; tingling, pain, or numbness in extremities; or other unusual, persistent adverse reactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Injection, solution [preservative free]:

Replagal™ [CAN]: 1 mg/1mL (3.5 mL) [not available in the U.S.]

Generic AvailableNo

ManufacturerShire Human Genetic Therapies Inc

Mechanism of ActionAgalsidase alfa is a recombinant form of the enzyme alpha-galactosidase-A, which catalyzes the hydrolysis of globotriaosylceramide (Gb-3) and other glycosphingolipids. These compounds may accumulate (over many years) within the tissues of patients with Fabry disease, leading to renal and cardiovascular complications. Agalsidase has been noted to reduce cellular levels of Gb-3 within the liver, heart, kidney, blood vessels, and in plasma.

Pharmacodynamics/Kinetics

Distribution: V_d: 17% of body weight

Metabolism: Plasma; via peptide hydrolysis

Half-life elimination: ~1.5-2 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness, fatigue, hypersomnia, or panic attacks

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsAgalsidase Alpha; Alpha-Galactosidase-A (Gene-Activated)

Medication Safety Issues

Sound-alike/look-alike issues:

Agalsidase beta may be confused with agalsidase alfa, alglucerase, alglucosidase alfa

International issues:

Agalsidase beta may be confused with agalsidase alfa, which is available in international markets

Pronunciation(aye GAL si days BAY ta)
U.S. Brand NamesFabrazyme®
Canadian Brand NamesFabrazyme®
Pharmacologic CategoryEnzyme
Use: Labeled IndicationsReplacement therapy for Fabry disease
Dosing: AdultsFabry disease: I.V.: 1 mg/kg every 2 weeks
Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Fabry disease: Children ≥8 years: I.V.: 1 mg/kg every 2 weeks

Dosing: Renal ImpairmentNo dosage adjustment required.
Dosing: Adjustment for ToxicityPatient with IgE antibodies to agalsidase beta (rechallenge): 0.5 mg/kg every 2 weeks at an initial maximum infusion rate of 0.01 mg/minute; may gradually escalate dose (to maximum of 1 mg/kg every 2 weeks) and/or infusion rate (doubling the infusion rate every 30 minutes to a maximum rate of 0.25 mg/minute) as tolerated.
Administration: I.V.Antipyretics should be administered prior to infusion.
Administration: I.V. DetailInitial infusion rate should not exceed 0.25 mg/minute (15 mg/hour). Interrupt or decrease rate in the event of an infusion reaction; may be restarted after resolution of symptoms and/or after administration of antipyretics, antihistamines, and/or steroids. After patient tolerance to the infusion is established, rate may be increased in increments of 0.05-0.08 mg/minute (3-5 mg/hour) with each subsequent infusion. Maximum infusion rate: Patients <30 kg: 0.25 mg/minute; patients ≥30 kg: Infuse over at least 1.5 hours. An initial maximum infusion rate of 0.01 mg/minute should be used for rechallenge in patients with IgE antibodies; may increase infusion rate (doubling the infusion rate every 30 minutes) to a maximum rate of 0.25 mg/minute as tolerated. A 0.2 micron low protein-binding filter may be used during administration.
StorageStore intact vials between 2°C and 8°C (36°F and 46°F). Reconstituted vials and final infusion should be used immediately if possible, but may be stored for up to 24 hours between 2°C and 8°C (36°F and 46°F).
ReconstitutionEach 35 mg vial should be reconstituted with 7.2 mL SWFI; reconstitute 5 mg vials with 1.1 mL SWFI; inject down internal side wall of vial; roll and tilt gently. Resulting solution contains 5 mg/mL. Do not use filter needle to prepare. To make final infusion, add the desired amount of reconstituted solution to make a final volume based on patient weight. The minimum total volume will range from 50 mL in patients ≤35 kg to 500 mL in patients >100 kg. Avoid vigorous shaking or agitation.
CompatibilityStable in NS.

Compatibility when admixed: Do not mix with other products.

ContraindicationsHypersensitivity to agalsidase beta or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Antibody formation: Development of IgG antibodies is common, however some patients may also develop IgE antibodies; consider IgE testing in patients with allergic reaction. Rechallenge of patients with IgE-mediated reaction may be done with caution.

- Infusion reactions: Infusion-related reactions are common, and may be severe; pretreatment with antipyretics is advised. Medication for the treatment of reactions should be readily available.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease; may have increased risk of complications from infusion reactions; monitor closely.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <8 years of age.

Other warnings/precautions:

- Registry: A registry has been created to monitor therapeutic responses and adverse effects during long-term treatment; patients should be encouraged to register (www.fabryregistry.com or 1-800-745-4447).

Pregnancy Risk FactorB

Pregnancy ConsiderationsAnimal reproduction studies have not demonstrated adverse effects. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential are encouraged to enroll in Fabry registry.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsNursing mothers are encouraged to enroll in Fabry registry.

Adverse Reactions**Note:** The most common and serious adverse reactions are infusion reactions (symptoms may include fever, tachycardia, hypertension, throat tightness, dyspnea, chills, abdominal pain, pruritus, urticaria, vomiting).

>10%:

Cardiovascular: Peripheral edema (21%)

Otic: Tinnitus (8%), hearing impairment (5%)

Renal: Creatinine increased (9%), proteinuria (5%)

Respiratory: Sinusitis (9%), bronchitis (8%), congestion (8%), dyspnea (8%), pharyngitis (6%), wheezing (6%)

Miscellaneous: Feeling cold (10%), viral infection (5% to 6%), fungal infection (5%), infusion reactions (≥5%)

Other reported severe reactions (frequency not established): Abdominal pain, arrhythmia, ataxia, bradycardia, cardiac arrest, cardiac output decreased, chest pain, face edema, flushing, hypotension, nausea, nephrotic syndrome, pallor, stroke, throat tightness, urticaria, vertigo

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersDevelopment of IgG or IgE antibodies in patients with suspected allergic reactions (test available from manufacturer). Monitor for infusion-related reactions.

Nursing: Physical Assessment/MonitoringAssess patient for previous experience with enzyme replacement therapy prior to beginning therapy. Note specific administration details related to initial infusion rate and subsequent rates. Premedication with antipyretics is recommended. Patient must be monitored closely for infusion reactions (fever, chills, dyspnea, tachycardia, hypertension, pruritus, vomiting) during and following infusion; medication/equipment for treating reactions should be readily available. Encourage patients to enroll in Frabry registry (see product inset). Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsDevelopment of IgG or IgE antibodies in patients with suspected allergic reactions (test available from manufacturer).

Patient EducationThis medication can only be administered by infusion; you will be closely monitored during infusion. Report immediately unusual acute pain; difficulty breathing or chest tightness; vomiting; difficulty swallowing; itching or rash; or redness, swelling, or pain at infusion site. Between treatments, maintain adequate hydration (2-3 L/day of fluids, unless instructed to restrict fluid intake) and nutrition (small frequent meals). You may experience abdominal discomfort or vomiting (small, frequent meals and good mouth care may help); headache, fatigue, or dizziness (use caution when driving or engaging in tasks that require alertness until response to medication is known); or limb, back, or muscle pain (consult prescriber for appropriate analgesia). Report chest discomfort, palpitations, rapid heart beat, or acute headache; signs of infection or rash; swelling of limbs or significant weight increase; difficulty breathing or chest tightness; persistent gastrointestinal discomfort or vomiting; tingling, pain, or numbness in extremities; or other unusual, persistent adverse reactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Fabrazyme®: 5 mg [contains mannitol 33 mg; derived from Chinese hamster cells]; 35 mg [contains mannitol 222 mg; derived from Chinese hamster cells]

Generic AvailableNo

ManufacturerGenzyme

Mechanism of ActionAgalsidase beta is a recombinant form of the enzyme alpha-galactosidase-A, which is required for the hydrolysis of GL-3 and other glycosphingolipids. The compounds may accumulate (over many years) within the tissues of patients with Fabry disease, leading to renal and cardiovascular complications. In clinical trials of limited duration, agalsidase been noted to reduce tissue inclusions of a key sphingolipid (GL-3). It is believed that long-term enzyme replacement may reduce clinical manifestations of renal failure, cardiomyopathy, and stroke. However, the relationship to a reduction in clinical manifestations has not been established.

Pharmacodynamics/Kinetics

Distribution: V_{dss}: Children: 247-1097 mL/kg; Adults: 112-570 mL/kg

Half-life elimination: Children: 86-151 minutes; Adults: 45-119 minutes

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusAnxiety and dizziness are common; may cause depression
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsAlpha-Galactosidase-A (Recombinant); r-h α-GAL

International Brand NamesFabrazyme (AT, AU, BE, BG, CH, CZ, DE, DK, ES, FI, FR, GB, GR, HN, IE, IL, IT, KP, NL, NO, NZ, PL, PT, RU, SE, TR)

Pharmacologic CategoryChemotherapy Regimen, Soft Tissue Sarcoma

Regimen UseSoft tissue sarcoma

RegimenNOTE: Multiple variations are listed below.

Variation 1:

Doxorubicin: I.V.: 25 mg/m^2/day continuous infusion days 1, 2, and 3

[total dose/cycle = 75 mg/m^2]

Ifosfamide: I.V.: 2 g/m^2/day days 1 to 5

[total dose/cycle = 10 g/m^2]

Mesna: I.V.: 400 mg/m^2 day 1

followed by I.V.: 1200 mg/m^2/day continuous infusion days 1 to 5

[total dose/cycle = 6400 mg/m^2]

Repeat cycle every 3 weeks

Variation 2:

Doxorubicin: I.V.: 30 mg/m^2/day continuous infusion days 1, 2, and 3

[total dose/cycle = 90 mg/m^2]

Ifosfamide: I.V.: 2.5 g/m^2 /day days 1 to 4

[total dose/cycle = 10 g/m^2]

Mesna: I.V.: 500 mg/m^2 day 1

followed by I.V.: 1500 mg/m^2/day continuous infusion days 1 to 4

[total dose/cycle = 6500 mg/m^2]

Filgrastim: SubQ: 5 mcg/kg/day days 5 through ANC recovery

Repeat cycle every 3 weeks

Albendazole

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

International issues:

Albenza® may be confused with Avanza® which is a brand name for mirtazapine in Australia

Pronunciation(al BEN da zole)
U.S. Brand NamesAlbenza®
Pharmacologic CategoryAnthelmintic
Use: Labeled IndicationsTreatment of parenchymal neurocysticercosis caused by *Taenia solium* and cystic hydatid disease of the liver, lung, and peritoneum caused by *Echinococcus granulosus*
Use: Unlabeled/InvestigationalAlbendazole has activity against *Ascaris lumbricoides* (roundworm); *Ancylostoma caninum*; *Ancylostoma duodenale* and *Necator americanus* (hookworms); cutaneous larva migrans; *Enterobius vermicularis* (pinworm); *Gnathostoma spinigerum*; *Gongylonema* sp; *Mansonella perstans* (filariasis); *Opisthorchis sinensis* (liver fluke); visceral larva migrans (toxocariasis); activity has also been shown against the liver fluke *Clonorchis sinensis*, *Giardia lamblia*, *Cysticercus cellulosae*, and *Echinococcus multilocularis*. Albendazole has also been used for the treatment of intestinal microsporidiosis (*Encephalitozoon intestinalis*), disseminated microsporidiosis (*E. hellem*, *E. cuniculi*, *E. intestinalis*, *Pleistophora* sp, *Trachipleistophora* sp, *Brachiola vesicularum*), and ocular microsporidiosis (*E. hellem*, *E. cuniculi*, *Vittaforma corneae*).
Dosing: Adults
Neurocysticercosis: Oral:

<60 kg: 15 mg/kg/day in 2 divided doses (maximum: 800 mg/day) for 8-30 days

≥60 kg: 800 mg/day in 2 divided doses for 8-30 days

Note: Give concurrent anticonvulsant and steroid therapy during first week.

Hydatid: Oral:

<60 kg: 15 mg/kg/day in 2 divided doses (maximum: 800 mg/day)

≥60 kg: 800 mg/day in 2 divided doses

Note: Administer dose for three 28-day cycles with a 14-day drug-free interval in between. The manufacturer recommends a total of 3 cycles.

***Ancylostoma caninum*, *Ascaris lumbricoides*(roundworm), *Ancylostoma duodenale (hookworm)*, and *Necator americanus*(hookworm) (unlabeled use):** Oral: 400 mg as a single dose

***Clonorchis sinensis*(Chinese liver fluke) (unlabeled use):** Oral: 10 mg/kg for 7 days

Cutaneous larva migrans (unlabeled use): Oral: 400 mg once daily for 3 days

***Enterobius vermicularis*(pinworm) (unlabeled use):** Oral: 400 mg as a single dose; may repeat in 2 weeks

***Gnathostoma spinigerum* (unlabeled use):** Oral: 800 mg/day in 2 divided doses for 21 days

Gongylonemiasis (unlabeled use): Oral: 10 mg/kg/day for 3 days

***Mansonella perstans*(unlabeled use):** Oral: 800 mg/day in 2 divided doses for 10 days

Visceral larva migrans (toxocariasis) (unlabeled use): Oral: 800 mg/day in 2 divided doses for 5 days

***Cysticercus cellulosae*(unlabeled use):** Oral: 800 mg/day in 2 divided doses for 8-30 days; may be repeated as necessary

Disseminated microsporidiosis (unlabeled use): Oral: 800 mg/day in 2 divided doses

***Echinococcus granulosus*(tapeworm) (unlabeled use):** Oral: 800 mg/day in 2 divided doses for 1-6 months

Intestinal microsporidiosis (unlabeled use): Oral: 800 mg/day in 2 divided doses for 21 days

Ocular microsporidiosis (unlabeled use): Oral: 800 mg/day in 2 divided doses, in combination with fumagillin

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Neurocysticercosis: Oral: Refer to adult dosing.

Hydatid: Oral: Refer to adult dosing.

***Cysticercus cellulosae*(unlabeled use):** Oral: 15 mg/kg/day (maximum: 800 mg/day) in 2 divided doses for 8-30 days; may be repeated as necessary

***Echinococcus granulosus*(tapeworm) (unlabeled use):** Oral: 15 mg/kg/day (maximum: 800 mg) divided twice daily for 1-6 months

For the following unlabeled uses, refer to adult dosing:

Ancylostoma caninum, *Ascaris lumbricoides* (roundworm), *Ancylostoma duodenale* (hookworm), *Clonorchis sinensis*, (Chinese liver fluke), cutaneous larva migrans, *Enterobius vermicularis* (pinworm), *Gnathostoma spinigerum*, gongylonemiasis, *Mansonella perstans*, *Necator americanus* (hookworm), visceral larva migrans (toxocariasis)

Administration: OralShould be administered with a high-fat meal. Administer anticonvulsant and steroid therapy during first week of neurocysticercosis therapy. If patients have difficulty swallowing, tablets may be crushed or chewed, then swallowed with a drink of water.

Dietary ConsiderationsShould be taken with a high-fat meal.

StorageStore between 20°C and 25°C (68°F to 77°F)

ContraindicationsHypersensitivity to albendazole, benzimidazoles, or any component of the formulation

Allergy Considerations

- Benzimidazole Anthelmintics Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Bone marrow suppression: Agranulocytosis, aplastic anemia, granulocytopenia, leukopenia, and pancytopenia have occurred leading to fatalities (rare); use with caution in patients with hepatic impairment (more susceptible to hematologic toxicity). Discontinue therapy in all patients who develop clinically significant decreases in blood cell counts.

- Transaminase elevations: Reversible elevations in hepatic enzymes have been reported. Patients with abnormal LFTs and hepatic echinococcosis are at an increased risk of hepatotoxicity. Discontinue therapy if LFT elevations are >2 times the upper limit of normal; may consider restarting treatment (with frequent monitoring of LFTs) when hepatic enzymes return to pretreatment values.

Disease-related concerns:

- Neurocysticercosis: Appropriate use: Corticosteroids should be administered before or upon initiation of albendazole therapy to minimize inflammatory reactions and prevent cerebral hypertension. Anticonvulsant therapy should be used concurrently during the first week of therapy to prevent seizures. If retinal lesions exist, weigh risk of further retinal damage due to albendazole-induced changes to the retinal lesion vs benefit of disease treatment.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAlbendazole has been shown to be teratogenic in laboratory animals and should not be used during pregnancy, if at all possible. Women should be advised to avoid pregnancy for at least 1 month following therapy. Discontinue if pregnancy occurs during treatment.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%:

Central nervous system: Headache (11% neurocysticercosis; 1% hydatid)

Hepatic: LFTs increased (16% hydatid; <1% neurocysticercosis)

1% to 10%:

Central nervous system: Intracranial pressure increased (up to 2%), dizziness (≤1%), fever (≤1%), vertigo (≤1%), meningeal signs (1%)

Dermatologic: Alopecia (<1% to 2%)

Gastrointestinal: Abdominal pain (up to 6%), nausea/vomiting (4% to 6%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening symptoms): Acute liver failure, acute renal failure, aplastic anemia, agranulocytosis, erythema multiforme, granulocytopenia, hepatitis, hypersensitivity reaction, leukopenia, neutropenia, pancytopenia, rash, Stevens-Johnson syndrome, thrombocytopenia, urticaria

Metabolism/Transport Effects**Substrate** (minor) of CYP1A2, 3A4; **Inhibits** CYP1A2 (weak)

Drug Interactions

Aminoquinolines (Antimalarial): May decrease the serum concentration of Anthelmintics. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Albendazole serum levels may be increased if taken with a fatty meal (increases the oral bioavailability by up to 5 times).

Monitoring ParametersMonitor fecal specimens for ova and parasites for 3 weeks after treatment; if positive, retreat; LFTs and CBC with differential at start of each 28-day cycle and every 2 weeks during therapy (more frequent monitoring for patients with liver disease); pregnancy test

Nursing: Physical Assessment/MonitoringDosing based on identification of parasite. Note pretreatment suggestions. Assess laboratory results for therapeutic effectiveness (reduction or elimination of ova and parasites) and adverse reactions (eg, elevated LFTs, leukopenia). Teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsMonitor fecal specimens for ova and parasites for 3 weeks after treatment; if positive, retreat; LFTs and CBC with differential at start of each 28-day cycle and every 2 weeks during therapy (more frequent monitoring for patients with liver disease); pregnancy test

Patient EducationYou may be prescribed other medications to take during first week of therapy. Do not take any other new medication during therapy unless approved by prescriber. Laboratory tests may be required; maintain recommended schedule. Take as directed, with a high-fat meal. Follow prescriber's suggestions to prevent reinfection. May cause loss of hair (reversible); nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or dizziness or headaches (use caution when driving or engaging in tasks that require alertness until response to drug is known). Report unusual fever, persistent or unresolved abdominal pain, vomiting, yellowing of skin or eyes, darkening of urine, or light colored stools. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended. Becoming pregnant within 1 month following therapy is not advised.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Albenza®: 200 mg

Generic AvailableNo

ManufacturerSmithKline Beecham Pharmaceuticals

Pricing: U.S. (www.drugstore.com)

Tablets (Albenza)

200 mg (12): $26.99

Mechanism of ActionActive metabolite, albendazole sulfoxide, causes selective degeneration of cytoplasmic microtubules in intestinal and tegmental cells of intestinal helminths and larvae; glycogen is depleted, glucose uptake and cholinesterase secretion are impaired, and desecratory substances accumulate intracellulary. ATP production decreases causing energy depletion, immobilization, and worm death.

Pharmacodynamics/Kinetics

Absorption: Poor; may increase up to 5 times when administered with a fatty meal

Distribution: Well inside hydatid cysts and CSF

Protein binding: 70%

Metabolism: Hepatic; extensive first-pass effect; pathways include rapid sulfoxidation to active metabolite (albendazole sulfoxide [major]), hydrolysis, and oxidation

Half-life elimination: 8-12 hours

Time to peak, serum: 2-5 hours

Excretion: Urine (<1% as active metabolite); feces

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay rarely cause bone marrow suppression; use caution with clozapine and carbamazepine. Carbamazepine may increase the metabolism of albendazole.

Medication Safety Issues

Sound-alike/look-alike issues:

Albutein® may be confused with albuterol

Buminate® may be confused with bumetanide

Pronunciation(al BYOO min)
U.S. Brand NamesAlbumarc®; Albuminar®; AlbuRx™; Albutein®; Buminate®; Flexbumin; Plasbumin®
Canadian Brand NamesPlasbumin®-25; Plasbumin®-5
Pharmacologic CategoryBlood Product Derivative; Plasma Volume Expander, Colloid
Use: Labeled IndicationsPlasma volume expansion and maintenance of cardiac output in the treatment of certain types of shock or impending shock; may be useful for burn patients, ARDS, and cardiopulmonary bypass; other uses considered by some investigators (but not proven) are retroperitoneal surgery, peritonitis, and ascites; unless the condition responsible for hypoproteinemia can be corrected, albumin can provide only symptomatic relief or supportive treatment
Use: Unlabeled/InvestigationalIn cirrhotics, administered with diuretics to help facilitate diuresis; large volume paracentesis; volume expansion in dehydrated, mildly-hypotensive cirrhotics
Dosing: Adults

Note: Use **5%** solution in hypovolemic patients or intravascularly-depleted patients. Use **25%** solution in patients in whom fluid and sodium intake is restricted.

Usual dose: 25 g; initial dose may be repeated in 15-30 minutes if response is inadequate; no more than 250 g should be administered within 48 hours.

Hypoproteinemia: I.V.: 0.5-1 g/kg/dose; repeat every 1-2 days as calculated to replace ongoing losses.

Hypovolemia: 5% albumin: 0.5-1 g/kg/dose; repeat as needed. **Note:** May be considered after inadequate response to crystalloid therapy and when nonprotein colloids are contraindicated. The volume administered and the speed of infusion should be adapted to individual response.

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Note:5% should be used in hypovolemic patients or intravascularly-depleted patients. **25%** should be used in patients in whom fluid and sodium intake must be minimized.

Dose depends on condition of patient: Hypovolemia: I.V.: 0.5-1 g/kg/dose (10-20 mL/kg/dose of albumin 5%); maximum dose: 6 g/kg/day

Administration: I.V.For I.V. administration only. Use within 4 hours after opening vial; discard unused portion. In emergencies, may administer as rapidly as necessary to improve clinical condition. After initial volume replacement:

5%: Do not exceed 2-4 mL/minute in patients with normal plasma volume; 5-10 mL/minute in patients with hypoproteinemia

25%: Do not exceed 1 mL/minute in patients with normal plasma volume; 2-3 mL/minute in patients with hypoproteinemia

Administration: I.V. DetailDo not dilute 5% solution. Rapid infusion may cause vascular overload. Albumin 25% may be given undiluted or diluted in normal saline. May give in combination or through the same administration set as saline or carbohydrates. Do not use with ethanol or protein hydrolysates, precipitation may form.

pH: 6.4-7.4

Dietary Considerations

Albumarc®, Albuminar®, Albutein®, Buminate®, Flexbumin: 5% [50 mg/mL] and 25% [250 mg/mL] contain sodium 130-160 mEq/L

Plasbumin®: 5% [50 mg/mL] and 25% [250 mg/mL] contain sodium ~145 mEq/L

StorageStore at a temperature ≤30°C (86°F); do not freeze. Do not use solution if it is turbid or contains a deposit; use within 4 hours after opening vial; discard unused portion.
ReconstitutionIf 5% human albumin is unavailable, it may be prepared by diluting 25% human albumin with 0.9% sodium chloride or 5% dextrose in water. Do not use sterile water to dilute albumin solutions, as this has been associated with hypotonic-associated hemolysis.
CompatibilityStable in dextran 6% in D_5W, dextran 6% in NS, D_5LR, D_5NS, $D_5{}^1/_2NS$, $D_5{}^1/_4NS$, D_5W, $D_{10}W$, LR, NS, ${}^1/_2NS$; **incompatible** with sterile water.

Y-site administration: Compatible: Diltiazem, lorazepam. **Incompatible:** Midazolam, vancomycin, verapamil.

Compatibility when admixed: Compatible: TPN. **Incompatible:** Verapamil.

ContraindicationsHypersensitivity to albumin or any component of the formulation; patients with severe anemia or cardiac failure
Warnings/Precautions

Concerns related to adverse effects:

- Hypervolemia: All patients should be observed for signs of hypervolemia such as pulmonary edema; monitor closely with rapid infusions.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; protein load may exacerbate or precipitate encephalopathy.

- Renal impairment: Use with caution in patients with renal impairment; protein load may precipitate azotemia.

Special populations:

- Preterm infants: Avoid 25% concentration in preterm infants due to risk of intraventricular hemorrhage.

- Sodium restricted patients: Use with caution in those patients for whom sodium restriction is necessary.

Other warnings/precautions:

- Nutritional supplementation: Is not an appropriate indication for albumin.

Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/compatible
Adverse ReactionsFrequency not defined.

Cardiovascular: CHF precipitation, edema, hyper-/hypotension, hypervolemia, tachycardia

Central nervous system: Chills, fever, headache

Dermatologic: Pruritus, rash, urticaria

Gastrointestinal: Nausea, vomiting

Respiratory: Bronchospasm, pulmonary edema

Miscellaneous: Anaphylaxis

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersBlood pressure, pulmonary edema, hematocrit
Nursing: Physical Assessment/MonitoringAsses patient for hepatic or renal failure. Patient should be monitored closely for pulmonary edema and cardiac failure (vital signs, central venous pressure) during administration, with frequent assessment for hypovolemia or fluid overload. If adverse reactions (eg, fever, tachycardia, hypotension, or dyspnea) occur, infusion should be stopped and prescriber notified. Teach patient adverse symptoms to report.
Monitoring: Lab TestsHematocrit
Patient EducationEducation is provided as appropriate for patient condition. This medication can only be administered intravenously. You will be monitored closely during the infusion. Report immediately any pain or bruising at infusion site, acute headache, difficulty breathing, chills, chest pain or tightness, palpitations, or sudden pain. **Pregnancy precaution:** Inform prescriber if you are pregnant.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free; human]: 5% (250 mL, 500 mL); 25% (50 mL, 100 mL)

Albuminar®: 5% (50 mL, 250 mL, 500 mL) [50 mg/mL; contains sodium 130-160 mEq/L and potassium ≤1 mEq/L; packaging contains dry natural rubber]; 25% (20 mL, 50 mL, 100 mL) [250 mg/mL; contains sodium 130-160 mEq/L and potassium ≤1 mEq/L; packaging contains dry natural rubber]

AlbuRx™: 5% (250 mL, 500 mL) [50 mg/mL; contains sodium 130-160 mEq/L and potassium ≤2 mEq/L]; 25% (50 mL, 100 mL) [250 mg/mL; contains sodium 130-160 mEq/L and potassium ≤2 mEq/L]

Albutein®: 5% (250 mL, 500 mL) [50 mg/mL; contains sodium 130-160 mEq/L and potassium ≤2 mEq/L]

Buminate®: 5% (250 mL, 500 mL) [50 mg/mL; contains sodium 130-160 mEq/L and potassium ≤2 mEq/L; packaging contains dry natural rubber]; 25% (20 mL, 50 mL, 100 mL) [250 mg/mL; contains sodium 130-160 mEq/L and potassium ≤2 mEq/L; packaging contains dry natural rubber]

Flexbumin: 25% (50 mL, 100 mL) [250 mg/mL; contains sodium 130-160 mEq/L and potassium ≤2 mEq/L]

Human Albumin Grifols®: 25% (50 mL, 100 mL) [250 mg/mL; contains sodium 130-160 mEq/L and potassium ≤2 mEq/L]

Plasbumin®: 5% (50 mL, 250 mL) [50 mg/mL; contains sodium ~145 mEq/L and potassium ≤2 mEq/L]; 25% (20 mL, 50 mL, 100 mL) [250 mg/mL; contains sodium ~145 mEq/L and potassium ≤2 mEq/L]

Generic AvailableYes
Mechanism of ActionProvides increase in intravascular oncotic pressure and causes mobilization of fluids from interstitial into intravascular space

Pharmacotherapy Pearls Albumin 5% and 25% solutions contain 130-160 mEq/L sodium and are considered isotonic with plasma. Dilution of albumin 25% solution with sterile water produces a hypotonic solution; administration of such can cause hemolysis and/or renal failure. An albumin 5% solution is osmotically equivalent to an equal volume of plasma, whereas a 25% solution is osmotically equivalent to 5 times its volume of plasma. Albumin solutions are heated to 60°C for 10 hours, decreasing any possible risk of viral hepatitis transmission. To date, there have been no reports of viral transmission using these products.

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment None reported

Anesthesia and Critical Care Concerns/Other Considerations An Australian/New Zealand group recently published results from their evaluation of resuscitation fluid (4% albumin versus normal saline) in a heterogeneous intensive care population (Finfer, 2004). They conducted this multicenter, randomized, double-blind trial to compare the effects of resuscitation fluid on mortality from any cause during the 28-day period after randomization. Patients were eligible for inclusion if the treating clinician judged that fluid resuscitation was required for intravascular fluid depletion as supported by one of the following criteria:

Heart rate >90 bpm,

Systolic BP <100 mm Hg,

Mean arterial BP <75 mm Hg,

Decrease of 40 mm Hg in systolic or mean arterial BP (as compared with baseline),

CVP <10 mm Hg,

PCWP <12 mm Hg,

Respiratory variation in systolic or mean BP >5 mm Hg,

Capillary refill time >1 second, or

Urine output <0.5 mL/kg for 1 hour

Patients were excluded for a variety of reasons, including ICU transfer following cardiac or liver transplantation surgery, or burn treatment. Almost 7000 patients were randomized; 3497 to albumin and 3500 to saline. Baseline characteristics were similar between the groups, except CVP pressure was slightly higher in the albumin group (9.0 in albumin versus 8.6 in saline). There was no significant mortality difference between groups (726 deaths in albumin group; 729 deaths in saline group). There were no significant differences in secondary endpoints (length of stay in the ICU or hospital, days of mechanical ventilation, and days of renal replacement therapy). Similar outcomes resulted from use of either fluid for resuscitation in this patient population.

Index Terms Albumin (Human); Normal Human Serum Albumin; Normal Serum Albumin (Human); Salt Poor Albumin; SPA

FDA Advisory: Transition to HFA-Propelled Albuterol Inhalers - June 2008

The Food and Drug Administration (FDA) has issued a Public Health Advisory to announce a phase out of albuterol chlorofluorocarbon (CFC) propelled inhalers to hydrofluoralkane (HFA) propelled albuterol inhalers. The CFC propelled albuterol inhalers will not be available in the U.S. after December 31, 2008, and patients should be transitioned to a hydrofluoralkane (HFA) propelled albuterol inhaler now. To date, the three HFA-propelled albuterol inhalation aerosol inhalers on the market include ProAir™ HFA, Proventil® HFA, and Ventolin® HFA. In addition, levalbuterol, the (R) enantiomer of racemic albuterol, is also available as Xoponex HFA™ inhalation aerosol.

This national transition from CFC-propelled inhalers to HFA-propelled inhalers is ongoing and other medications using CFC-propelled inhalers will be phased out over the next several years.

Additional information may be found at http://www.fda.gov/cder/drug/advisory/albuterol_cfc.htm

Medication Safety Issues

Sound-alike/look-alike issues:

Albuterol may be confused with Albutein®, atenolol

Proventil® may be confused with Bentyl®, Prilosec® Prinivil®

Salbutamol may be confused with salmeterol

Ventolin® may be confused with phentolamine, Benylin®, Vantin®

Volmax® may be confused with Flomax®

Pronunciation(al BYOO ter ole)

U.S. Brand NamesAccuNeb®; ProAir™ HFA; Proventil® HFA; Proventil® [DSC]; Ventolin® HFA; VoSpire ER®

Canadian Brand NamesAiromir; Alti-Salbutamol; Apo-Salvent®; Apo-Salvent® CFC Free; Apo-Salvent® Respirator Solution; Apo-Salvent® Sterules; Gen-Salbutamol; PMS-Salbutamol; ratio-Inspra-Sal; ratio-Salbutamol; Rhoxal-salbutamol; Salbu-2; Salbu-4; Ventolin®; Ventolin® Diskus; Ventolin® HFA; Ventolin® I.V. Infusion; Ventrodisk

Pharmacologic CategoryBeta$_2$ Agonist

Use: Labeled IndicationsBronchodilator in reversible airway obstruction due to asthma or COPD; prevention of exercise-induced bronchospasm

Use: Unlabeled/InvestigationalAs tocolytic agent (injectable form; not available in U.S.)

Dosing: Adults

Bronchospasm:

Metered-dose inhaler: 2 puffs every 4-6 hours as needed (NIH Guidelines, 2007):

Solution for nebulization: 1.25-5 mg every 4 to 8 hours as needed (NIH Guidelines, 2007)

Oral: 2-4 mg/dose 3-4 times/day; maximum dose not to exceed 32 mg/day (divided doses)

Extended release: 8 mg every 12 hours; maximum dose not to exceed 32 mg/day (divided doses). A 4 mg dose every 12 hours may be sufficient in some patients, such as adults of low body weight.

I.V. continuous infusion (Ventolin® I.V. solution [not available in U.S.]): Severe bronchospasm and status asthmaticus: Initial: 5 mcg/minute; may increase up to 10-20 mcg/minute at 15- to 30-minute intervals if needed

Exacerbation of asthma (acute, severe) (NIH Guidelines, 2007):

Metered-dose inhaler: 4-8 puffs every 20 minutes for up to 4 hours, then every 1-4 hours as needed

Solution for nebulization: 2.5-5 mg every 20 minutes for 3 doses, then 2.5-10 mg every 1-4 hours as needed, **or** 10-15 mg/hour by continuous nebulization

Exercise-induced bronchospasm (prevention):*Metered-dose inhaler:* 2 puffs 5-30 minutes prior to exercise

Dosing: Elderly

Inhalation: Refer to adult dosing.

Bronchospasm (treatment): Oral: 2 mg 3-4 times/day; maximum: 8 mg 4 times/day

Dosing: Pediatric

Bronchospasm:

Oral, regular release:

Children 2-6 years: 0.1-0.2 mg/kg/dose 3 times/day (maximum: 12 mg/day)

Children 6-12 years: 2 mg/dose 3-4 times/day (maximum 24 mg/day)

Children >12 years: 2-4 mg/dose 3-4 times/day (maximum: 32 mg/day)

Oral, extended release:

Children 6-12 years: 4 mg every 12 hours (maximum: 24 mg/day)

Children >12 years: 8 mg every 12 hours (maximum 32 mg/day)

Metered-dose inhaler (90 mcg/puff): NIH Guidelines, 2007: Quick relief:

Children ≤4 years: 1-2 puffs every 4-6 hours as needed

Children 5-11 years: 2 puffs every 4-6 hours as needed

Children ≥12 years: 2 puffs every 4-6 hours as needed

Solution for nebulization:

Manufacturer's recommendations:

Children 2-12 years (AccuNeb®): 0.63-1.25 mg every 4-6 hours as needed

Children ≥12 years: 2.5 mg every 4-8 hours as needed

NIH Guidelines, 2007: Quick relief:

Children ≤4 years: 0.63-2.5 mg every 4-6 hours as needed

Children ≥5 years: 1.25-5 mg every 4-8 hours as needed

I.V. (Ventolin® I.V. solution [not available in U.S.]): Dosage not established for children

Exacerbation of asthma (acute, severe) (NIH Guidelines, 2007):

Metered-dose inhaler (90 mcg/puff):

Children <12 years: 4-8 puffs every 20 minutes for 3 doses, then every 1-4 hours as needed

Children ≥12 years: 4-8 puffs every 20 minutes for up to 4 hours, then every 1-4 hours as needed

Solution for nebulization:

Children <12 years: 0.15 mg/kg (minimum: 2.5 mg) every 20 minutes for 3 doses, then 0.15-0.3 mg/kg (maximum: 10 mg) every 1-4 hours as needed, **or** 0.5 mg/kg/hour by continuous nebulization

Children ≥12 years: 2.5-5 mg every 20 minutes for 3 doses, then 2.5-10 mg every 1-4 hours as needed, **or** 10-15 mg/hour by continuous nebulization

Exercise-induced bronchospasm (prevention):*Metered-dose inhaler (90 mcg/puff):*

Children ≤4 years: 1-2 puffs 5 minutes prior to exercise (NIH Guidelines, 2007)

Children >4 years: 2 puffs 5-30 minutes prior to exercise

Dosing: Renal ImpairmentNot removed by hemodialysis

Administration: I.V.Infusion solution (Ventolin® I.V.): Do not inject undiluted. Reduce concentration by at least 50% before infusing. Administer as a continuous infusion via infusion pump. Discard unused portion of infusion within 24 hours of preparation.

Administration: OralDo not crush or chew extended release tablets.

Administration: Inhalation

Metered-dose inhaler: Shake well before use; prime prior to first use, and whenever inhaler has not been used for >2 weeks or when it has been dropped, by releasing 3-4 test sprays into the air (away from face). A spacer device or valved holding chamber is recommended for use with metered-dose inhalers.

Solution for nebulization: Concentrated solution should be diluted prior to use. Blow-by administration is not recommended, use a mask device if patient unable to hold mouthpiece in mouth for administration.

Dietary ConsiderationsOral forms should be administered with water 1 hour before or 2 hours after meals.

Storage

HFA aerosols: Store at 15°C to 25°C (59°F to 77°F).

Ventolin® HFA: Discard after using 200 actuations or 3 months after removal from protective pouch, whichever comes first. Store with mouthpiece down.

Infusion solution (not available in U.S.): Ventolin® I.V.: Store at 15°C to 30°C (59°F to 86°F). Protect from light. After dilution, discard after 24 hours.

Solution for nebulization (0.5%): Store at 2°C to 30°C (36°F to 86°F).

AccuNeb®: Store at 2°C to 25°C (36°F to 77°F). Do not use if solution changes color or becomes cloudy. Use within 1 week of opening foil pouch.

Syrup: Store at 2°C to 30°C (36°F to 86°F).

Tablet: Store at 2°C to 30°C (36°F to 86°F).

Tablet, extended release: Store at 20°C to 25°C (68°F to 77°F)

ReconstitutionSolution for nebulization: To prepare a 2.5 mg dose, dilute 0.5 mL of solution to a total of 3 mL with normal saline; also compatible with cromolyn or ipratropium nebulizer solutions.

Compatibility

Intravenous solution: Stable in water for injection, NS, D_5W, and D_5NS when mixed in PC bags or glass bottles. Avoid addition of other medications to infusion solution.

Solution for nebulization: **Compatible** with cromolyn sodium, budesonide inhalation suspension, ipratropium solution for nebulization

ContraindicationsHypersensitivity to albuterol, adrenergic amines, or any component of the formulation

Injection formulation (not available in U.S.): Patients with tachyarrhythmias; risk of abortion during first or second trimester

Warnings/Precautions

Concerns related to adverse effects:

- Bronchospasm: Rarely, paradoxical bronchospasm may occur with use of inhaled bronchodilating agents; this should be distinguished from inadequate response.

- Hypersensitivity reactions: Immediate hypersensitivity reactions (urticaria, angioedema, rash, bronchospasm) have been reported.

Disease-related concerns:

- Asthma: Appropriate use: Optimize anti-inflammatory treatment before initiating maintenance treatment with albuterol. Do not use as a component of chronic therapy without an anti-inflammatory agent. Only the mildest forms of asthma (Step 1 and/or exercise-induced) would not require concurrent use based upon asthma guidelines.

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (arrhythmia or hypertension or HF); beta-agonists may cause elevation in blood pressure, heart rate and result in CNS stimulation/excitation. Beta$_2$-agonists may also increase risk of arrhythmias.

- Diabetes: Use with caution in patients with diabetes mellitus; beta$_2$-agonists may increase serum glucose.

- Glaucoma: Use with caution in patients with glaucoma; may elevate intraocular pressure.

- Hyperthyroidism: Use with caution in hyperthyroidism; may stimulate thyroid activity.

- Hypokalemia: Use with caution in patients with hypokalemia; beta$_2$-agonists may decrease serum potassium.

- Seizures: Use with caution in patients with seizure disorders; beta-agonists may result in CNS stimulation/excitation.

Special populations:

- Pediatrics: Face masks should be used in children <4 years of age.

Dosage form specific issues:

- Chlorofluorocarbons: Patient response may vary between inhalers that contain chlorofluorocarbons and those which are chlorofluorocarbon-free.

Other warnings/precautions:

- Appropriate use: Do not exceed recommended dose; serious adverse events, including fatalities, have been associated with excessive use of inhaled sympathomimetics.

- Patient information: Patients must be instructed to seek medical attention in cases where acute symptoms are not relieved or a previous level of response is diminished. The need to increase frequency of use may indicate deterioration of asthma, and treatment must not be delayed. A spacer device or valved holding chamber is recommended when using a metered-dose inhaler.

Geriatric ConsiderationsBecause of its minimal effect on beta$_1$-receptors and its relatively long duration of action, albuterol is a rational choice in elderly when a beta-agonist is indicated. Elderly patients may find it beneficial to utilize a spacer device when using a metered dose inhaler. Oral use should be avoided due to adverse effects.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAlbuterol crosses the placenta; tocolytic effects, fetal tachycardia, fetal hypoglycemia secondary to maternal hyperglycemia with oral or intravenous routes reported. Available evidence suggests safe use as an inhalation during pregnancy, and albuterol is the preferred short-acting beta agonist for use in asthma according to the NHLBI 2007 Guidelines for the Diagnosis and Management of Asthma.

Use of the parenteral formulation (not available in the U.S.) as a tocolytic agent has been associated with myocardial ischemia. Patients with a history of cardiac disease should be referred to a cardiologist for evaluation prior to initiating therapy in premature labor. If therapy is initiated, patients should be carefully monitored for ECG changes as well as for changes in fluid balance and cardiopulmonary function. Maternal pulse rate should not exceed 140 beats per minute during I.V. infusion of salbutamol. Consider discontinuing therapy with the development of signs of pulmonary edema or myocardial ischemia. Cautious use of parenteral salbutamol, as with other beta$_2$-agonists, is also warranted when used during labor and delivery for the relief of bronchospasm.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsIncidence of adverse effects is dependent upon age of patient, dose, and route of administration.

Cardiovascular: Angina, atrial fibrillation, arrhythmias, chest discomfort, chest pain, extrasystoles, flushing, hyper-/hypotension, palpitation, supraventricular tachycardia, tachycardia

Central nervous system: CNS stimulation, dizziness, drowsiness, headache, insomnia, irritability, lightheadedness, migraine, nervousness, nightmares, restlessness, seizure

Dermatologic: Angioedema, rash, urticaria

Endocrine & metabolic: Hyperglycemia, hypokalemia, lactic acidosis

Gastrointestinal: Diarrhea, dry mouth, dyspepsia, gastroenteritis, nausea, unusual taste, vomiting

Genitourinary: Micturition difficulty

Local: Injection: Pain, stinging

Neuromuscular & skeletal: Muscle cramps, musculoskeletal pain, tremor, weakness

Otic: Otitis media, vertigo

Respiratory: Asthma exacerbation, bronchospasm, cough, epistaxis, laryngitis, oropharyngeal drying/irritation, oropharyngeal edema, pharyngitis, rhinitis, upper respiratory inflammation, viral respiratory infection

Miscellaneous: Allergic reaction, anaphylaxis, diaphoresis, lymphadenopathy

Postmarketing and/or case reports: Anxiety, glossitis, hoarseness, myocardial ischemia, pulmonary edema, throat irritation, tongue ulceration

Drug Interactions

Alpha-/Beta-Blockers: May diminish the therapeutic effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Atomoxetine: May enhance the tachycardic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Beta-Blockers (Beta1 Selective): May diminish the bronchodilatory effect of Beta2-Agonists. Of particular concern with nonselective beta-blockers or higher doses of the beta1 selective beta-blockers. *Risk C: Monitor therapy*

Beta-Blockers (Nonselective): May diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Betahistine: May diminish the therapeutic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Avoid or limit caffeine (may cause CNS stimulation).

Herb/Nutraceutical: Avoid ephedra, yohimbe (may cause CNS stimulation). Avoid St John's wort (may decrease the levels/effects of albuterol).

Test InteractionsIncreased renin (S), increased aldosterone (S)

Monitoring ParametersFEV$_1$, peak flow, and/or other pulmonary function tests; blood pressure, heart rate; CNS stimulation; serum glucose, serum potassium; asthma symptoms; arterial or capillary blood gases (if patients condition warrants)

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor vital signs, effectiveness of therapy, and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Monitoring: Lab TestsArterial or capillary blood gases (if patients condition warrants); FEV_1, peak flow, and/or other pulmonary function tests; serum potassium, serum glucose (in selected patients)

Patient EducationUse exactly as directed; do not use more often than recommended. Take oral medicine with water 1 hour before or 2 hours after meals. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience nervousness, dizziness, or fatigue (use caution when driving or engaging in hazardous activities until response to drug is known); dry mouth, unpleasant taste, stomach upset (frequent, small meals, frequent mouth care, chewing gum, or sucking lozenges may help); or difficulty urinating (always void before treatment). Report unresolved GI upset, dizziness or fatigue, vision changes, chest pain or palpitations, persistent inability to void, nervousness or insomnia, muscle cramping or tremor, seizures, unusual swelling of extremities and weight gain, unusual respiratory difficulty, or unusual cough. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Self-administered inhalation: Do not freeze. Shake canister before using. Sit when using medication. Close eyes when administering albuterol to avoid spray getting into eyes. Exhale slowly and completely through nose; inhale deeply through mouth while administering aerosol. Hold breath for 5-10 seconds after inhalation. Wait at least 1 full minute between inhalations. Wash mouthpiece between use. If more than one inhalation medication is used, use albuterol first and wait 5 minutes between medications. Prime inhaler prior to first use, and whenever the inhaler has not been used for more than 2 weeks, by releasing 4 test sprays into the air (away from face). Discard inhaler after labeled number of doses are used, even if the canister does not feel empty. **Ventolin® HFA:** Discard canister after 200 actuations or 3 months after removal from foil pouch, whichever comes first. Store with mouthpiece down. Do not allow metal canister to become wet.

Self-administered nebulizer: Wash hands before and after treatment. Wash and dry nebulizer after each treatment. Twist open the top of one unit-dose vial and squeeze contents into nebulizer reservoir. Connect nebulizer reservoir to the mouthpiece or face mask. Connect nebulizer to compressor. Sit in comfortable, upright position. Place mouthpiece in your mouth or put on face mask and turn on compressor. If face mask is used, avoid leakage around the mask to avoid mist getting into eyes which may cause vision problems. Breathe calmly and deeply until no more mist is formed in nebulizer (about 5 minutes). At this point, treatment is finished.

Volmax®: Tablets should be swallowed whole; do not crush or chew. Outer coating of tablet is not absorbed and may be found eliminated in stool.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product; [CAN] = Canadian brand name

Aerosol, for oral inhalation: 90 mcg/metered inhalation (17 g) [200 metered inhalations; contains chlorofluorocarbons]

Proventil®: 90 mcg/metered inhalation (17 g) [200 metered inhalations; contains chlorofluorocarbons] [DSC]

Aerosol, for oral inhalation:

ProAir™ HFA: 90 mcg/metered inhalation (8.5 g) [200 metered inhalations; chlorofluorocarbon free]

Proventil® HFA: 90 mcg/metered inhalation (6.7 g) [200 metered inhalations; chlorofluorocarbon free]

Ventolin® HFA: 90 mcg/metered inhalation (8 g) [60 metered inhalation; chlorofluorocarbon free]; (18 g) [200 metered inhalations; chlorofluorocarbon free]

Injection, solution, as sulphate:

Ventolin® I.V. [CAN]: 1 mg/1mL (5 mL) [not available in U.S.]

Solution for nebulization: 0.042% (3 mL); 0.083% (3 mL); 0.5% (0.5 mL, 20 mL)

AccuNeb® [preservative free]: 0.63 mg/3 mL (3 mL) [0.021%]; 1.25 mg/3 mL (3 mL) [0.042%]

Proventil®: 0.083% (3 mL) [DSC] [preservative free]

Syrup, as sulfate: 2 mg/5 mL (480 mL)

Tablet: 2 mg, 4 mg

Tablet, extended release: 4 mg, 8 mg

VoSpire ER®: 4 mg, 8 mg

Mechanism of ActionRelaxes bronchial smooth muscle by action on beta$_2$-receptors with little effect on heart rate

Pharmacodynamics/Kinetics

Onset of action: Peak effect:

Nebulization/oral inhalation: 0.5-2 hours

CFC-propelled albuterol: 10 minutes

Ventolin® HFA: 25 minutes

Oral: 2-3 hours

Duration: Nebulization/oral inhalation: 3-4 hours; Oral: 4-6 hours

Metabolism: Hepatic to an inactive sulfate

Half-life elimination: Inhalation: 3.8 hours; Oral: 3.7-5 hours

Excretion: Urine (30% as unchanged drug)

Related Information

- Bronchodilators
- Inhalant Agents

Pharmacotherapy PearlsThe 2007 National Heart, Lung, and Blood Institute Guidelines for the Diagnosis and Management of Asthma do not recommend the use of oral systemic albuterol as a quick-relief medication and do not recommend regularly scheduled daily, chronic use of inhaled beta-agonists for long-term control of asthma.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay produce CNS stimulation resulting in anxiety, tremor, and insomnia

Mental Health: Effects on Psychiatric TreatmentEffect of propranolol may be reduced; cardiovascular effects (tachycardia, palpitations) may be increased with MAO inhibitors, TCAs, and amphetamines

Cardiovascular ConsiderationsBeta-agonists will induce increases in heart rate. This should be considered in patients with resting tachycardia. Because of the frequent coexistence of chronic obstructive lung disease and coronary artery disease, many patients are on simultaneous therapy with beta-agonists and beta-blockade. This combination should, for obvious reasons, be avoided. Frequent use of inhaled beta-agonists when used in patients with atrial fibrillation may counteract pharmacologic interventions directed at rate control. Inhaled beta-agonists may be used to treat acute hyperkalemia in patients with renal failure.

Anesthesia and Critical Care Concerns/Other ConsiderationsFrequent use of inhaled beta-agonists in patients with atrial fibrillation may counteract pharmacologic interventions directed at rate control. Inhaled beta-agonists may be used to treat acute hyperkalemia in patients with renal failure.

Index TermsAlbuterol Sulfate; Salbutamol; Salbutamol Sulphate

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Aclovate® may be confused with Accolate®

Pronunciation(al kloe MET a sone)

U.S. Brand NamesAclovate®

Pharmacologic CategoryCorticosteroid, Topical

Use: Labeled IndicationsTreatment of inflammation of corticosteroid-responsive dermatosis (low to medium potency topical corticosteroid)

Use: DentalTreatment of inflammation of corticosteroid-responsive dermatosis (low to medium potency topical corticosteroid)

Dosing: AdultsSteroid-responsive dermatoses: Topical: Apply a thin film to the affected area 2-3 times/day. **Note:** Therapy should be discontinued when control is achieved; if no improvement is seen within 2 weeks, reassessment of diagnosis may be necessary.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricSteroid-responsive dermatoses: Topical: Children ≥1 year: Apply thin film to affected area 2-3 times/day. **Note:** Therapy should be discontinued when control is achieved; if no improvement is seen within 2 weeks, reassessment of diagnosis may be necessary. Do not use for >3 weeks.

Administration: TopicalFor external use only. Do not use on open wounds. Should not be used in the presence of open or weeping lesions. Apply sparingly to occlusive dressings.

StorageStore between 2°C and 30°C (36°F and 86°F).

ContraindicationsHypersensitivity to alclometasone or any component of the formulation; viral, fungal, or tubercular skin lesions

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: Systemic absorption of topical corticosteroids may cause hypothalamic-pituitary-adrenal (HPA) axis suppression (reversible) particularly in younger children. HPA axis suppression may lead to adrenal crisis. Risk is increased when used over large surface areas, for prolonged periods, or with occlusive dressings.
- Contact dermatitis: Allergic contact dermatitis can occur, it is usually diagnosed by failure to heal rather than clinical exacerbation.
- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.
- Systemic effects: Adverse systemic effects including hyperglycemia, glycosuria, fluid and electrolyte changes, and HPA suppression may occur when used on large surface areas, for prolonged periods, or with an occlusive dressing.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <1 year of age. Chronic use of corticosteroids in children may interfere with growth and development. Not for the treatment of diaper dermatitis.

Geriatric ConsiderationsDue to age-related changes in skin, limit use of topical glucocorticosteroids.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects have been observed in animals administered topical corticosteroids.

Adverse ReactionsFrequency not defined.

Dermatologic: Acne, allergic dermatitis, hypopigmentation, maceration of the skin, perioral dermatitis, skin atrophy, striae, miliaria, telangiectasia

Endocrine & metabolic: HPA suppression, Cushing's syndrome, growth retardation

Local: Burning, erythema, itching, irritation, dryness, folliculitis, hypertrichosis, papular rash

Miscellaneous: Secondary infection

Drug Interactions

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

Patient EducationBefore applying, gently wash area to reduce risk of infection. Apply a thin film to cleansed area and rub in gently and thoroughly until medication vanishes. Avoid exposure to sunlight; severe sunburn may occur.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream, as dipropionate: 0.05% (15 g, 45 g, 60 g)

Aclovate®: 0.05% (15 g, 60 g)

Ointment, as dipropionate: 0.05% (15 g, 45 g, 60 g)

Aclovate®: 0.05% (15 g, 45 g, 60 g)

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Cream (Aclovate)

0.05% (45): $73.99

Cream (Alclometasone Dipropionate)

0.05% (45): $38.99

0.05% (60): $52.99

Ointment (Aclovate)

0.05% (15): $44.99

Mechanism of ActionStimulates the synthesis of enzymes needed to decrease inflammation, suppress mitotic activity, and cause vasoconstriction

Pharmacodynamics/Kinetics

Absorption: Topical: ~3% absorbed systemically after 8 hours when applied to intact skin

Related Information

- Corticosteroids

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsAlclometasone Dipropionate

Ethanol may be confused with Ethyol®, Ethamolin®

Pronunciation(AL koe hol, ETH il)

U.S. Brand NamesEpiClenz™ [OTC]; Gel-Stat™ [OTC]; GelRite [OTC]; Isagel® [OTC] ; Lavacol® [OTC]; Prevacare® [OTC]; Protection Plus® [OTC]; Purell® 2 in 1 [OTC]; Purell® with Aloe [OTC]; Purell® [OTC]

Canadian Brand NamesBiobase-G™; Biobase™

Pharmacologic CategoryAntidote; Pharmaceutical Aid

Use: Labeled IndicationsTopical anti-infective; pharmaceutical aid; therapeutic neurolysis (nerve or ganglion block); replenishment of fluid and carbohydrate calories

Use: Unlabeled/InvestigationalAntidote for ethylene glycol overdose; antidote for methanol overdose; treatment of fat occlusion of central venous catheters

Dosing: Adults

Antiseptic:*Liquid denatured alcohol:* Topical: Apply 1-3 times/day as needed

Therapeutic neurolysis (nerve or ganglion block):*Dehydrated alcohol injection 98%:* Intraneural: Dosage variable depending upon the site of injection (eg, trigeminal neuralgia: 0.05-0.5 mL as a single injection per interspace vs subarachnoid injection: 0.5-1 mL as a single injection per interspace); single doses >1.5 mL are seldom required

Replenishment of fluid and carbohydrate calories:*Dehydrated alcohol infusion:* Alcohol 5% and dextrose 5%: 1-2 L/day by slow infusion

Treatment of methanol or ethylene glycol ingestion (unlabeled use):Note: I.V. administration is the preferred route; continue therapy until ethylene glycol and/or methanol is no longer detected or levels are <20 mg/dL **and** the patient is asymptomatic **and** metabolic acidosis has been corrected. If ethylene glycol and/or methanol levels are not available in a timely manner, continue therapy until the estimated time of clearance of ethylene glycol and/or methanol has elapsed **and** the patient is asymptomatic with a normal pH. If patient has coingested ethanol, measure the baseline serum ethanol concentration and adjust the ethyl alcohol loading dose based on results to achieve a serum ethanol level of ~100 mg/dL.

Absolute ethyl alcohol [98% (196 proof) = 77.4 g EtOH/dL]:

Oral: Solution must be diluted to a ≤20% concentration with water or juice and administered orally or via a nasogastric tube.

Initial: 600-700 mg/kg [equivalent to 0.78-0.9 mL/kg using a **98% solution**]

Maintenance: Goal of therapy is to maintain serum ethanol levels >100 mg/dL

Nondrinker: 66 mg/kg/hour [equivalent to 0.09 mL/kg/hour using a **98% solution**]

Chronic drinker: 154 mg/kg/hour [equivalent to 0.20 mL/kg/hour using a **98% solution**]

Dosage adjustment for hemodialysis: Maintenance dose:

Nondrinker: 169 mg/kg/hour [equivalent to 0.22 mL/kg/hour using a **98% solution**]

Chronic drinker: 257 mg/kg/hour [equivalent to 0.33 mL/kg/hour using a **98% solution**]

I.V.:

Initial: 600 mg/kg [equivalent to 7.6-8.9 mL/kg using a **10% solution**]

Maintenance: Goal of therapy is to maintain serum ethanol levels >100 mg/dL.

Nondrinker: 66 mg/kg/hour [equivalent to 0.83 mL/kg/hour using a **10% solution**]

Chronic drinker: 154 mg/kg/hour [equivalent to 1.96 mL/kg/hour using a **10% solution**]

Dosage adjustment for hemodialysis: Maintenance dose:

Nondrinker: 169 mg/kg/hour [equivalent to 2.13 mL/kg/hour using a **10% solution**]

Chronic drinker: 257 mg/kg/hour [equivalent to 3.26 mL/kg/hour using a **10% solution**]

Treatment of fat occlusion of central venous catheters (unlabeled use):*Dehydrated alcohol injection:* I.V. (see institutional-based protocol for catheter clearance assessment, the following assessment is a general methodology): Up to 3 mL of ethanol 70% (maximum: 0.55 mL/kg); the volume to instill is equal to the internal volume of the catheter

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Antiseptic:*Liquid denatured alcohol:* Refer to adult dosing.

Treatment of methanol or ethylene glycol ingestion (unlabeled use):*Absolute ethanol/ethyl alcohol:* Refer to adult dosing.

Treatment of fat occlusion of central venous catheters (unlabeled use):*Dehydrated alcohol injection:* Refer to adult dosing.

Dosing: Renal ImpairmentTreatment of methanol or ethylene glycol ingestion (unlabeled use): Absolute ethanol/ethyl alcohol: Dosage adjustment for hemodialysis: Maintenance dose:

Oral:

Nondrinker: 169 mg/kg/hour [equivalent to 0.22 mL/kg/hour using a **98% solution**]

Chronic drinker: 257 mg/kg/hour [equivalent to 0.33 mL/kg/hour using a **98% solution**]

I.V.:

Nondrinker: 169 mg/kg/hour [equivalent to 2.13 mL/kg/hour using a **10% solution**]

Chronic drinker: 257 mg/kg/hour [equivalent to 3.26 mL/kg/hour using a **10% solution**]

Administration: I.V.

Ethylene glycol or methanol poisoning: I.V. administration is the preferred route. Administer as a 10% solution in D$_5$W. Initial dose should be administered over 1 hour.

Treatment of occluded central venous catheter: Instill a 70% solution with a volume equal to the internal volume of the catheter. Assess patency at 30-60 minutes (or per institutional protocol).

Administration: OralEthylene glycol or methanol poisoning: Dilute ethyl alcohol to ≤20% solution with water or juice and administer hourly by mouth or via nasogastric tube. Out-of-hospital management with orally-administered ethanol is not recommended.

Administration: OtherIntraneural: Separate needles should be used for each of multiple injections or sites to prevent residual alcohol deposition at sites not intended for tissue destruction. Inject slowly after determining proper placement of needle. Since dehydrated alcohol is hypobaric when compared with spinal fluid, proper positioning of the patient is essential to control localization of injections into the subarachnoid space.

ContraindicationsHypersensitivity to ethyl alcohol or any component of the formulation; seizure disorder and diabetic coma; subarachnoid injection of dehydrated alcohol in patients receiving anticoagulants; pregnancy (prolonged use or high doses at term)

Warnings/Precautions

Disease-related concerns:

- Diabetes: Use with caution in patients with diabetes mellitus; ethyl alcohol may decrease blood sugar.
- Gout: Use with caution in patients with gout.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Shock: Use with caution in patients with shock.

Special populations:

- Cranial surgery: Use with caution in patients following cranial surgery.
- Infants: Minimize dermal exposure of ethyl alcohol in infants as significant systemic absorption and toxicity can occur. Ethyl alcohol passes freely into breast milk at a level approximately equivalent to maternal serum level.
- Pregnancy: Use with caution in pregnant women with anticipated postpartum hemorrhage.

Other warnings/precautions:

- Administration: Proper positioning of the patient for neurolytic administration is essential to control localization of the injection of dehydrated alcohol (which is hypobaric) into the subarachnoid space; avoid extravasation. Not for SubQ administration. Do not administer simultaneously with blood due to the possibility of pseudoagglutination or hemolysis; may potentiate severe hypoprothrombic bleeding. Avoid extravasation during I.V. administration.
- Monitoring: Clinical evaluation and periodic lab determinations, including serum ethanol levels, are necessary to monitor effectiveness, changes in electrolyte concentrations, and acid-base balance (when used as an antidote). Monitor blood glucose closely, particularly in children as treatment of ingestions is associated with hypoglycemia.
- Proper storage: Flammable liquid and should be kept cool and away from any heat source.

Pregnancy Risk FactorC (D per expert opinion)/X (prolonged use or high doses at term)

Pregnancy ConsiderationsReproduction studies have not been conducted with alcohol injection. Ethanol crosses the placenta, enters the fetal circulation, and has teratogenic effects in humans. The following withdrawal symptoms have been noted in the neonate following maternal ethanol consumption during pregnancy: Crying, hyperactivity, irritability, poor suck, tremors, seizures, poor sleeping pattern, hyperphagia, and diaphoresis. Fetal alcohol syndrome (FAS) is a term referring to a combination of physical, behavioral, and cognitive abnormalities resulting from ethanol exposure during fetal development. Since a “safe” amount of ethanol consumption during pregnancy has not been determined, the AAP recommends those women who are pregnant or planning a pregnancy refrain from all ethanol intake. When used as an antidote during the second or third trimester, FAS is not likely to occur due to the short treatment period; use during the first trimester is controversial.

LactationEnters breast milk/use caution (AAP rates “compatible”)

Breast-Feeding ConsiderationsEthanol is found in breast milk. Drowsiness, diaphoresis, deep sleep, weakness, decreased linear growth, and abnormal weight gain have been reported in infants following large amounts of ethanol ingestion by the mother. Ingestion >1 g/kg/day decreases milk ejection reflex. The actual clearance of ethanol from breast milk is dependent upon the mother's weight and amount of ethanol consumed.

Adverse ReactionsFrequency not defined.

Cardiovascular: Flushing, hypotension

Central nervous system: Disorientation, encephalopathy, sedation, seizure (rare), vertigo

Endocrine & metabolic: Hypoglycemia

Genitourinary: Urinary retention

Local: Nerve and tissue destruction

Miscellaneous: Intoxication

Drug Interactions

Acitretin: Alcohol (Ethyl) may enhance the teratogenic effect of Acitretin. *Risk X: Avoid combination*

Amprenavir: Alcohol (Ethyl) may enhance the adverse/toxic effect of Amprenavir. This is specifically related to the propylene glycol contained in amprenavir oral solution, not capsules. *Risk X: Avoid combination*

Cefamandole: May enhance the adverse/toxic effect of Alcohol (Ethyl). A disulfiram-like reaction may occur. *Risk C: Monitor therapy*

Cefotetan: May enhance the adverse/toxic effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

CNS Depressants: May enhance the CNS depressant effect of Alcohol (Ethyl). **Exceptions:** Epinastine; Ketotifen; Levocabastine; Olopatadine. *Risk C: Monitor therapy*

Disulfiram: May enhance the adverse/toxic effect of Alcohol (Ethyl). A disulfiram-like reaction may occur. *Risk X: Avoid combination*

Furazolidone: May enhance the adverse/toxic effect of Alcohol (Ethyl). A disulfiram-like reaction may occur. *Risk C: Monitor therapy*

Griseofulvin: May enhance the adverse/toxic effect of Alcohol (Ethyl). A disulfiram-like reaction may occur. *Risk C: Monitor therapy*

MetroNIDAZOLE: May enhance the adverse/toxic effect of Alcohol (Ethyl). A disulfiram-like reaction may occur. *Risk C: Monitor therapy*

NIFEdipine: Alcohol (Ethyl) may increase the serum concentration of NIFEdipine. *Risk C: Monitor therapy*

Propranolol: Alcohol (Ethyl) may decrease the serum concentration of Propranolol. Alcohol (Ethyl) may increase the serum concentration of Propranolol. *Risk C: Monitor therapy*

Sulfonylureas: May enhance the adverse/toxic effect of Alcohol (Ethyl). A flushing reaction may occur. *Risk C: Monitor therapy*

Tacrolimus: May enhance the dermatologic adverse effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Verapamil: May increase the serum concentration of Alcohol (Ethyl). *Risk C: Monitor therapy*

Monitoring ParametersAntidotal therapy: Blood ethanol levels every 1-2 hours until steady state, then every 2-4 hours; blood glucose, electrolytes (including serum magnesium), arterial pH, blood gases, methanol or ethylene glycol blood levels; heart rate, blood pressure

Reference RangeAntidote for methanol/ethylene glycol: Blood ethanol level: Goal range: 100-150 mg/dL

Monitoring: Lab TestsAntidotal therapy: Blood ethanol levels every 1-2 hours until steady state, then every 2-4 hours; blood glucose, electrolytes (including serum magnesium), arterial pH, blood gases, methanol or ethylene glycol blood levels

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Foam, topical:

Epi-Clenz™: 62% (240 mL, 480 mL) [instant hand sanitizer; contains aloe vera and vitamin E]

Gel, topical:

Epi-Clenz™: 70% (45 mL, 120 mL, 480 mL) [instant hand sanitizer; contains aloe vera and vitamin E]

GelRite: 67% (120 mL, 480 mL, 800 mL) [instant hand sanitizer; contains vitamin E)

Gel-Stat™: 62% (120 mL, 480 mL) [instant hand sanitizer]

Isagel®: 60% (59 mL, 118 mL, 621 mL, 800 mL) [instant hand sanitizer]

Prevacare®: 60% (120 mL, 240 mL, 960 mL, 1200 mL, 1500 mL) [instant hand sanitizer]

Protection Plus®: 62% (800 mL) [instant hand sanitizer]

Purell®: 62% (15 mL, 30 mL, 59 mL, 120 mL, 236 mL, 250 mL, 360 mL, 500 mL, 800 mL, 1000 mL, 2000 mL) [instant hand sanitizer; contains moisturizers and vitamin E]

Purell® Moisture Therapy: 62% (75 mL) [instant hand sanitizer]

Purell® with Aloe: 62% (15 mL, 59 mL, 236 mL, 360 mL, 800 mL, 1000 mL, 2000 mL) [instant hand sanitizer; contains aloe and tartrazine]

Infusion [in D_5W, dehydrated]: Alcohol 5% (1000 mL) [DSC]

Injection, solution [dehydrated]: 98% (1 mL, 5 mL)

Liquid, topical [denatured]: 70% (3840 mL)

Lavacol®: 70% (473 mL)

Lotion, topical:

Purell® 2 in 1: 62% (60 mL, 360 mL, 1000 mL) [instant hand sanitizer]

Towelettes, topical:

Isagel®: 60% (50s, 300s) [instant hand sanitizer]

Purell®: 62% (35s, 175s) [instant hand sanitizer]

Generic AvailableYes

Mechanism of ActionWhen used to treat ethylene glycol or methanol toxicity, ethyl alcohol competitively inhibits alcohol dehydrogenase, an enzyme which catalyzes the metabolism of ethylene glycol and methanol to their toxic metabolites.

Pharmacodynamics/Kinetics

Absorption: Oral: Rapid

Distribution: V_d: 0.6-0.7 L/kg; decreased in women

Metabolism: Hepatic (90% to 98%) to acetaldehyde or acetate

Half-life elimination: Rate: 15-20 mg/dL/hour (range: 10-34 mg/dL/hour); increased in alcoholics

Excretion: Kidneys and lungs (~2% unchanged)

Pharmacotherapy Pearls

Neurolytic block: Pain will occur after initial injection for a short period of time and will subside when neurolysis occurs; agent will destroy nerve and should be administered when pain is from malignant origin only; administer carefully.

Replenishment of fluid and carbohydrate calories: If the daily fluid requirement is >3 L/day, use of alcohol 5% in dextrose 5% is not recommended.

Undiluted ethanol 196 proof = 98% solution = 77.4 g ethanol/dL

I.V. solution 10% = 7.9 g ethanol/dL

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause confusion, disorientation, encephalopathy, sedation, and dizziness

Mental Health: Effects on Psychiatric TreatmentAvoid use in patients receiving psychotropic agents. Concomitant use with psychotropic agents may produce additive sedation.

Anesthesia and Critical Care Concerns/Other Considerations

Neurolytic Block: Pain will occur after initial injection for a short period of time and will subside when neurolysis occurs. This agent will destroy nerve and should be administered when pain is from malignant origin only; administer carefully.

Methanol/ethylene Glycol Poisoning: Treatment involves inhibiting the formation of toxic metabolites by inhibiting alcohol dehydrogenase and/or urgent dialytic removal of these alcohols and their metabolites. Fomepizole and ethanol are both inhibitors of alcohol dehydrogenase and have been used to prevent toxicity. Currently, fomepizole is the drug of choice because of its ease of use and lack of CNS toxicity. When ethanol is used, a target serum level of 100-200 mg/dL (depending upon concurrent ethanol use) is maintained during treatment. Patients are treated until serum levels of the poison (ethylene glycol/methanol) are <20 mg/dL and patient is asymptomatic with normal pH or poison levels are undetectable.

Index TermsAlcohol, Absolute; Alcohol, Dehydrated; Ethanol; Ethyl Alcohol; EtOH

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Aldesleukin may be confused with oprelvekin

Proleukin® may be confused with oprelvekin

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(al des LOO kin)

U.S. Brand NamesProleukin®

Canadian Brand NamesProleukin®

Pharmacologic CategoryAntineoplastic Agent, Miscellaneous; Biological Response Modulator

Use: Labeled IndicationsTreatment of metastatic renal cell cancer, metastatic melanoma

Use: Unlabeled/InvestigationalHIV infection, and AIDS; non-Hodgkin's lymphoma

Dosing: AdultsRefer to individual protocols.

Renal cell carcinoma: I.V.: 600,000 int. units/kg every 8 hours for a maximum of 14 doses; repeat after 9 days for a total of 28 doses per course. Retreat if needed 7 weeks after previous course.

Melanoma:

I.V.:

Single-agent use: 600,000 int. units/kg every 8 hours for a maximum of 14 doses; repeat after 9 days for a total of 28 doses per course. Retreat if needed 7 weeks after previous course.

In combination with cytotoxic agents (unlabeled use): 24 million int. units/m^2 days 12-16 and 19-23

SubQ (unlabeled route):

Single-agent doses: 3-18 million int. units/day for 5 days each week, up to 6 weeks

In combination with interferon:

5 million int. units/m^2 3 times/week

1.8 million int. units/m^2 twice daily 5 days/week for 6 weeks

Investigational regimen: SubQ: 11 million int. units (flat dose) daily for 4 days per week for 4 consecutive weeks; repeat every 6 weeks

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo specific recommendations by manufacturer. Use with caution.

Dosing: Combination Regimens

Melanoma:

Cisplatin-Dacarbazine-Interferon Alfa-2b-Aldesleukin

IL-2 + IFN

Renal cell cancer:

Interleukin 2 (Low Dose)-Interferon Alfa 2b

Interleukin 2-Interferon Alfa-2

Interleukin 2-Interferon Alfa-2-Fluorouracil

Calculations

- Body Surface Area: Adults

Administration: I.V.Infuse over 15 minutes. Do not administer with an inline filter. Flush before and after with D$_5$W, particularly if

maintenance I.V. line contains sodium chloride.
⇧ Administration: I.V. Detail

Management of symptoms related to vascular leak syndrome:

If actual body weight increases >10% above baseline, or rales or rhonchi are audible:

Administer furosemide at dosage determined by patient response.

Administer dopamine hydrochloride 1-5 mcg/kg/minute to maintain renal blood flow and urine output.

If patient has dyspnea at rest: Give supplemental oxygen by facemask.

If patient has severe respiratory distress: Intubate patient and provide mechanical ventilation. Administer ranitidine (as the hydrochloride salt) 50 mg I.V. every 8-12 hours as prophylaxis against stress ulcers.

⇧ Administration: OtherMay be administered by SubQ injection (unlabeled route).
⇧ StorageStore vials of lyophilized injection in a refrigerator at 2°C to 8°C (36°F to 46°F). Reconstituted vials and solutions diluted for infusion are stable for 48 hours at room temperature or refrigerated, per the manufacturer. Solution diluted with D_5W to a concentration of 220 mg/mL and repackaged into tuberculin syringes was reported to be stable for 14 days refrigerated.
⇧ Reconstitution Reconstitute vials with 1.2 mL SWFI to a concentration of 18 million units/1 mL (sterile water should be injected towards the side of the vial). Gently swirl; do not shake. Further dilute with 50 mL of D_5W. Smaller volumes of D_5W should be used for doses <1.5 mg; avoid concentrations <30 mcg/mL and >70 mcg/mL (an increased variability in drug delivery has been seen).

Note: Filtration will result in significant loss of bioactivity.

Final Dilution Concentration (mcg/mL)	**Final Dilution Concentration (10^6 int. units/mL)**	**Stability**
<30	<0.49	Albumin must be added to bag **prior to addition** of aldesleukin at a final concentration of 0.1% (1 mg/mL) albumin; stable at room temperature or at ≥32°C (89°F) for 6 days[1,2]
≥30 to ≤70	≥0.49 to ≤1.1	Stable at room temperature at 6 days without albumin added or at ≥32°C (89°F) for 6 days only if albumin is added (0.1%)[1,2]
70-100	1.2-1.6	Unstable; avoid use
>100-500	1.7-8.2	Stable at room temperature and at ≥32°C (89°F) for 6 days[1,2]

[1] These solutions do not contain a preservative; use for more than 24 hours may not be advisable.

[2] Continuous infusion via ambulatory infusion device raises aldesleukin to this temperature.

⇧ CompatibilityStable in D_5W.

Y-site administration: Compatible: Amikacin, amphotericin B, calcium gluconate, co-trimoxazole, diphenhydramine, dopamine, fat emulsion 10%, fluconazole, foscarnet, gentamicin, heparin, magnesium sulfate, metoclopramide, morphine, ondansetron, piperacillin, potassium chloride, ranitidine, thiethylperazine, ticarcillin, tobramycin. **Incompatible:** Ganciclovir, lorazepam, NS, pentamidine, prochlorperazine edisylate, promethazine.

Compatibility when admixed: Incompatible with NS.

⇧ ContraindicationsHypersensitivity to aldesleukin or any component of the formulation; patients with abnormal thallium stress or pulmonary function tests; patients who have had an organ allograft; retreatment in patients who have experienced sustained ventricular tachycardia (≥5 beats), refractory cardiac rhythm disturbances, recurrent chest pain with ECG changes consistent with angina or myocardial infarction, intubation ≥72 hours, pericardial tamponade, renal dialysis for ≥72 hours, coma or toxic psychosis lasting ≥48 hours, repetitive or refractory seizures, bowel ischemia/perforation, GI bleeding requiring surgery
⇧ Warnings/Precautions

Boxed warnings:

- Capillary leak syndrome (CLS): See “Concerns related to adverse effects” below.

- Experienced physician: See “Other warnings/precautions” below.
- Infection: See “Concerns related to adverse effects” below.
- Lethargy/somnolence: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Adverse effects: Are frequent and sometimes fatal.
- Capillary leak syndrome (CLS): **[U.S. Boxed Warning]: High-dose aldesleukin therapy has been associated with capillary leak syndrome (CLS) resulting in hypotension and reduced organ perfusion which may be severe and can result in death.** Therapy should be restricted to patients with normal cardiac and pulmonary functions as defined by thallium stress and formal pulmonary function testing. Extreme caution should be used in patients with a history of prior cardiac or pulmonary disease. Patients must have a serum creatinine ≤1.5 mg/dL prior to treatment.
- CNS effects: Mental status changes (irritability, confusion, depression) can occur and may indicate bacteremia, hypoperfusion, CNS malignancy, or CNS toxicity.
- Infection: **[U.S. Boxed Warning]: Impaired neutrophil function is associated with treatment; patients are at risk for sepsis, bacterial endocarditis, and central line-related gram-positive infections.** Antibiotic prophylaxis which has been associated with a reduced incidence of staphylococcal infections in aldesleukin studies includes the use of oxacillin, nafcillin, ciprofloxacin, or vancomycin.
- Lethargy/somnolence: **[U.S. Boxed Warning]: Withhold treatment for patients developing moderate-to-severe lethargy or somnolence; continued treatment may result in coma.**

Disease-related concerns:

- Autoimmune/inflammatory disorders: Use with caution in patients with autoimmune disease or inflammatory disorders; may exacerbate condition.
- CNS metastases: Patients should be evaluated and treated for CNS metastases and have a negative scan prior to treatment.

Concurrent drug therapy issues:

- Supportive care for high-dose treatment: Standard prophylactic supportive care during high-dose aldesleukin treatment includes acetaminophen to relieve constitutional symptoms and an H_2 antagonist to reduce the risk of GI ulceration and/or bleeding.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician in a facility with cardiopulmonary or intensive specialists and intensive care facilities available.**

Pregnancy Risk FactorC

Pregnancy ConsiderationsMaternal toxicity and embryocidal effects were noted in animal studies. There are no adequate and well-controlled studies in pregnant women; use during pregnancy only if benefits to the mother outweigh potential risk to the fetus. Contraception is recommended for fertile males or females using this medication.

LactationExcretion unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for serious adverse reactions in the nursing infant, breast-feeding should be discontinued during treatment.

Adverse Reactions

>10%:

Cardiovascular: Hypotension (71%; grade 4: 3%), peripheral edema (28%), tachycardia (23%), edema (15%), vasodilation (13%), cardiovascular disorder (11%; includes blood pressure changes, CHF and ECG changes)

Central nervous system: Chills (52%), confusion (34%), fever (29%; grade 4: 1%), malaise (27%), somnolence (22%), anxiety (12%), pain (12%), dizziness (11%)

Dermatologic: Rash (42%), pruritus (24%), exfoliative dermatitis (18%)

Endocrine & metabolic: Acidosis (12%), hypomagnesemia (12%), hypocalcemia (11%)

Gastrointestinal: Diarrhea (67%), vomiting (19% to 50%), nausea (19% to 35%), stomatitis (22%), anorexia (20%), weight gain (18%), abdominal pain (11%)

Hematologic: Thrombocytopenia (37%; grade 4: 1%), anemia (29%), leukopenia (16%)

Hepatic: Hyperbilirubinemia (40%), AST increased (23%)

Neuromuscular & skeletal: Weakness (23%)

Renal: Oliguria (63%; grade 4: 6%), creatinine increased (33%)

Respiratory: Dyspnea (43%), lung disorder (24%; includes pulmonary congestion, rales, and rhonchi), cough (11%), respiratory disorder (11%; includes acute respiratory distress syndrome, infiltrates and pulmonary changes)

Miscellaneous: Infection (13%; grade 4: 1%)

1% to 10%:

Cardiovascular: Arrhythmia (10%), cardiac arrest (grade 4: 1%), MI (grade 4: 1%), supraventricular tachycardia (grade 4: 1%), ventricular tachycardia (grade 4: 1%)

Gastrointestinal: Abdomen enlarged (10%)

Hematologic: Coagulation disorder (grade 4: 1%)

Hepatic: Alkaline phosphatase increased (10%)

Renal: Anuria (grade 4: 5%), acute renal failure (grade 4: 1%)

Respiratory: Rhinitis (10%), apnea (grade 4: 1%)

Miscellaneous: Sepsis (grade 4: 1%)

<1%, postmarketing, and/or case reports (limited to important or life threatenting): Acute tubular necrosis, allergic interstitial nephritis, allergic reactions, anaphylaxis, atrial arrhythmia, AV block, blindness (transient or permanent), bowel necrosis, bradycardia, bullous pemphigoid, BUN increased, cardiomyopathy, cellulitis, cerebral edema, cerebral lesions, cerebral vasculitis, CHF, cholecystitis, colitis, coma, crescentic IgA glomuleronephritis, Crohn’s disease exacerbation, depression (severe; leading to suicide), diabetes mellitus, duodenal ulcer, encephalitis, endocarditis, extrapyramidal syndrome, gastrointestinal hemorrhage, hematemesis, hemoptysis, hemorrhage, hepatic failure, hepatitis, hepatosplenomegaly, hypertension, hyperuricemia, hyperventilation, hypothermia, hyperthyroidism, hypoventilation, hypoxia, inflammatory arthritis, injection site necrosis, intestinal obstruction, intestinal perforation, leukocytosis, malignant hyperthermia, meningitis, myocardial ischemia, myocarditis, myopathy, myositis, neuritis, neuropathy, neutropenia, oculobulbar myasthenia gravis, optic neuritis, pancreatitis, pericardial effusion, pericarditis, peripheral gangrene, phlebitis, pneumonia, pneumothorax, pulmonary edema, pulmonary embolus, renal failure, respiratory acidosis, respiratory arrest, respiratory failure, retroperitoneal hemorrhage, rhabdomyolysis, scleroderma, seizure (including grand mal), shock, Stevens-Johnson syndrome, stroke, syncope, thrombosis, thyroiditis, tracheoesophageal fistula, transient ischemic attack, urticaria, ventricular extrasystoles

Oncology: VesicantNo

Oncology: Emetic PotentialModerate-to-high (30% to 90%)

Drug Interactions

Contrast Media (Non-ionic): May enhance the potential for allergic or hypersensitivity reactions to Aldesleukin. *Risk C: Monitor therapy*

Interferons (Alfa): May enhance the adverse/toxic effect of Aldesleukin. In particular, risks of myocardial and renal toxicity may be increased by this combination. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsEthanol: May increase CNS adverse effects.

Monitoring Parameters

The following clinical evaluations are recommended for all patients prior to beginning treatment and then frequently during drug administration:

CBC with differential, blood chemistries including electrolytes, renal and hepatic function tests

Chest x-rays

Monitoring during therapy should include vital signs (temperature, pulse, blood pressure, and respiration rate) and weight; in a patient with a decreased blood pressure, especially <90 mm Hg, cardiac monitoring for rhythm should be conducted. If an abnormal complex or rhythm is seen, an ECG should be performed; vital signs in these hypotension patients should be taken hourly and central venous pressure (CVP) checked; monitor for change in mental status.

Pulmonary function (baseline and periodic) basis.

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. See Administration I.V. specifics. Infusion site should be monitored for extravasation. Vital signs; cardiac, respiratory, and CNS status; fluid balance; signs of systemic sepsis, changes in mental status, and laboratory reports should be assessed daily prior to beginning infusion and for 2 hours following infusion. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential; blood chemistries including electrolytes, renal and hepatic function; chest x-rays

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Avoid alcohol. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You will be susceptible to infection (avoid crowds and exposure to infection and do not have any vaccinations without consulting prescriber). May cause increased sensitivity to sunlight (use sunblock 15 SPF or greater, wear protective clothing, avoid direct sun exposure); or nausea, vomiting, stomatitis, anorexia (frequent mouth care, small frequent meals, chewing gum, or sucking lozenges may help). This drug may result in many side effects; you will be monitored and assessed closely during therapy, however, it is important that you report any changes or problems for evaluation. Report any changes in urination, unusual bruising or bleeding, chest pain or palpitations, acute dizziness, respiratory difficulty, fever or chills, changes in cognition, rash, feelings of pain or numbness in extremities, severe or persistent GI upset or diarrhea, vaginal discharge or mouth sores, yellowing of eyes or skin, or changes in color of urine or stool. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Proleukin®: 22 x 10^6 int. units [18 million int. units/mL = 1.1 mg/mL when reconstituted]

Generic AvailableNo

ManufacturerChiron Therapeutics

Pricing: U.S. (www.drugstore.com)

Solution (reconstituted) (Proleukin)

22000000 unit (1): $855.71

Mechanism of ActionAldesleukin promotes proliferation, differentiation, and recruitment of T and B cells, natural killer (NK) cells, and thymocytes; causes cytolytic activity in a subset of lymphocytes and subsequent interactions between the immune system and malignant cells; can stimulate lymphokine-activated killer (LAK) cells and tumor-infiltrating lymphocytes (TIL) cells.

Pharmacodynamics/Kinetics

Distribution: V_d: 4-7 L; primarily in plasma and then in the lymphocytes

Half-life elimination: I.V.: Initial: 6-13 minutes; Terminal: 80-120 minutes

Alefacept

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(a LE fa sept)
U.S. Brand NamesAmevive®
Canadian Brand NamesAmevive®
Pharmacologic Category[Monoclonal Antibody]
Use: Labeled IndicationsTreatment of moderate to severe chronic plaque psoriasis in adults who are candidates for systemic therapy or phototherapy
Dosing: AdultsPsoriasis (moderate-to-severe chronic plaque psoriasis):

I.M.: 15 mg once weekly; usual duration of treatment: 12 weeks

Second course: A second course of treatment may be initiated at least 12 weeks after completion of the initial course of treatment, provided CD4$^+$ T-lymphocyte counts are within the normal range.

Note: CD4$^+$ T-lymphocyte counts should be monitored before initiation of treatment and every 2 weeks during therapy. Dosing should be withheld if CD4$^+$ counts are <250 cells/µL, and dosing should be permanently discontinued if CD4$^+$ lymphocyte counts remain at <250 cell/µL for longer than 1 month.

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentNo dosage adjustment required.
Administration: I.M.I.M. injections should be administered at least 1 inch from previous administration sites.
StorageStore under refrigeration at 2°C to 8°C (36°F to 46°F); protect from light. Following reconstitution, may be stored for up to 4 hours at 2°C to 8°C (36°F to 46°F). Discard any unused solution after 4 hours.
ReconstitutionReconstitute 15 mg vial for I.M. solution with 0.6 mL of SWFI (supplied); 0.5 mL of reconstituted solution contains 15 mg of alefacept. Gently swirl to avoid foaming. Do not filter reconstituted solutions. Do not mix with other medications or solutions.
CompatibilityDo not mix with other medications or solutions.
RestrictionsAlefacept will be distributed directly to physician offices or to a specialty pharmacy; injections are intended to be administered in the physician's office
ContraindicationsHypersensitivity to alefacept or any component of the formulation; history of severe malignancy; patients with HIV infection or other clinically-important infections
Warnings/Precautions

Concerns related to adverse effects:

- Hepatic injury: In post-marketing reports, significant transaminase elevations, as well as rare cases of hepatitis, fatty liver, decompensation of cirrhosis, and acute hepatic failure have occurred (causal relationship not established). Discontinue if signs and symptoms of hepatic injury occur.

- Hypersensitivity reactions: Has been associated with hypersensitivity reactions; rare anaphylaxis also reported. Discontinue use if severe reaction occurs.

- Immune suppression: May increase the risk of infection and may reactivate latent infection; monitor for new infections. Avoid use in patients receiving other immunosuppressant drugs or phototherapy.

- Infusion reactions: Acute infusion reactions may occur. Medication and equipment for management should be available for immediate use.

- Lymphopenia: Induces a decline in circulating T-lymphocytes (CD4$^+$ and CD8$^+$); CD4$^+$ lymphocyte counts should be monitored every 2 weeks throughout therapy. Do not initiate in pre-existing depression of CD4$^+$ lymphocytes and withhold treatment in any patient who develops a depressed CD4$^+$ lymphocyte count (<250 cells/µL) during treatment; permanently discontinue if CD4$^+$ lymphocyte counts remain <250 cells/µL for 1 month.

- Malignancy: May increase the risk of malignancies; use caution in patients at high risk for malignancy. Discontinue if malignancy develops during therapy.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Immunizations: Patients should be brought up to date with all immunizations before initiating therapy. Live vaccines should not be given concurrently; there is no data available concerning secondary transmission of live vaccines in patients receiving therapy.

Pregnancy Risk FactorB
Pregnancy ConsiderationsEffects in pregnancy are not known. Teratogenic effects have not been observed in animal studies. Patients who

become pregnant during therapy or within 8 weeks of treatment are advised to enroll in pregnancy registry (866-263-8483).

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsIt is not known whether alefacept is excreted in breast milk. Since alefacept is an immunosuppressant, and transfer of proteins into breast milk may occur, breast-feeding women are cautioned to discontinue breast-feeding or to discontinue use of the drug while breast-feeding (recommendations per manufacturer).

Adverse Reactions

≥10%:

Hematologic: Lymphopenia (up to 10% of patients required temporary discontinuation, up to 17% during a second course of therapy)

Local: Injection site reactions (up to 16% of patients; includes pain, inflammation, bleeding, edema, or other reaction)

1% to 10%:

Central nervous system: Chills (6%; primarily during intravenous administration), dizziness (≥2%)

Dermatologic: Pruritus (≥2%)

Gastrointestinal: Nausea (≥2%)

Neuromuscular & skeletal: Myalgia (≥2%)

Respiratory: Pharyngitis (≥2%), cough increased (≥2%)

Miscellaneous: Malignancies (1% vs 0.5% in placebo), antibodies to alefacept (3%; significance unknown), infection (1% requiring hospitalization)

<1%: Anaphylaxis, allergic reaction, angioedema, headache, hepatitis, hepatic failure, MI, transaminases increased (≥3 times ULN), urticaria

Drug InteractionsThere are no known significant interactions.

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase risk of liver toxicity).

Monitoring ParametersBaseline $CD4^+$ T-lymphocyte counts prior to initiation and every 2 weeks during treatment course; severity of psoriatic lesions; signs and symptoms of infection

Nursing: Physical Assessment/MonitoringMonitor closely for the development of malignancies or infections. Assess results of laboratory tests, therapeutic effectiveness, and adverse response. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsBaseline $CD4^+$ T-lymphocyte counts prior to initiation and every 2 weeks during treatment course

Patient EducationThis medication can only be administered by injection; report immediately any pain, redness, swelling at injection site, chills, rash, difficulty swallowing or breathing, or feelings of tightness in chest. Avoid alcohol. You will need weekly blood tests while receiving this medication. May cause nausea or muscle pain. Report unusual feelings of fatigue or weakness; signs of infection (eg, cough, runny nose, sore throat, unusual cough, swollen glands, mouth sores, vaginal itching or discharge, burning on urination, fever, chills, or unhealed sores); abdominal pain; jaundice; easy bruising; dark urine; or pale stools. Notify prescriber if pregnancy occurs during therapy or within 8 weeks of treatment. **Breast-feeding precaution:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Amevive®: 15 mg [for I.M. administration; contains sucrose 12.5 mg; supplied with SWFI]

Generic AvailableNo

ManufacturerBiogen

Mechanism of ActionBinds to CD2, a receptor on the surface of lymphocytes, inhibiting their interaction with leukocyte functional antigen 3 (LFA-3). Interaction between CD2 and LFA-3 is important for the activation of T lymphocytes in psoriasis. Activated T lymphocytes secrete a number of inflammatory mediators, including interferon gamma, which are involved in psoriasis. Since CD2 is primarily expressed on T lymphocytes, treatment results in a reduction in $CD4^+$ and $CD8^+$ T lymphocytes, with lesser effects on other cell populations (NK and B lymphocytes).

Pharmacodynamics/Kinetics

Distribution: V_d: 0.094 L/kg

Bioavailability: 63% (following I.M. administration)

Half-life: 270 hours (following I.V. administration)

Excretion: Clearance: 0.25 mL/hour/kg

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentNone reported

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Alemtuzumab: Reports of Infection-Related Fatalities - November 2008

Bayer HealthCare and Genzyme, in conjunction with Health Canada, have issued notice to Canadian hospitals concerning reports of infection-related fatalities in patients receiving consolidation therapy with MabCampath® (alemtuzumab). Preliminary safety data from the ongoing phase II U.S. clinical trial CALGB10101 has reported fatalities in 6 out of 51 patients with B-cell chronic lymphocytic leukemia (B-CLL) receiving fludarabine and rituximab induction therapy followed by alemtuzumab therapy for remission consolidation.

Fatal infections included viral meningitis, *Listeria* meningitis, *Legionella* pneumonia, cytomegalovirus (CMV), *Pneumocystis jiroveci* pneumonia (PCP), and Epstein-Barr virus (EBV) associated lymphoproliferative disorder.

The potential contributory role of any of the three chemotherapeutic agents is not clear based on available data. The infectious complications may have resulted from prolonged immunosuppression. An additional noninfection-related fatality, thought to be transfusion-associated graft-versus-host disease (TAGVHD), has also been reported.

Use of alemtuzumab as consolidation therapy is presently not approved in Canada. An updated product monograph including this new important safety information is forthcoming. Further information can be found at http://www.hc-sc.gc.ca/dhp-mps/medeff/advisories-avis/prof/_2008/mabcampath_nth-aah-eng.php

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(ay lem TU zoo mab)

U.S. Brand NamesCampath®

Canadian Brand NamesMabCampath®

Pharmacologic CategoryAntineoplastic Agent, Monoclonal Antibody

Use: Labeled IndicationsTreatment of B-cell chronic lymphocytic leukemia (B-CLL)

Use: Unlabeled/InvestigationalTreatment of refractory T-cell prolymphocytic leukemia (T-PLL); rheumatoid arthritis; graft-versus-host disease; multiple myeloma; preconditioning regimen for stem-cell transplantation and renal and liver transplantation; post-transplant rejection (renal); treatment of autoimmune cytopenias

Dosing: Adults

B-CLL: I.V. infusion, SubQ (unlabeled route):

Initial: 3 mg/day beginning on day 1; when tolerated (no grade 3 or 4 infusion reactions), increase to maintenance dose of 30 mg/dose 3 times/week on alternate days for a total duration of therapy of up to 12 weeks

Maximum dose/day: 30 mg; maximum cumulative dose/week: 90 mg

Note: Dose escalation is required; usually accomplished in 3-7 days. Do not exceed single doses >30 mg or cumulative doses >90 mg/week. Pretreatment (with acetaminophen and an oral antihistamine) is recommended prior to the first dose, with dose escalations, and as clinically indicated; I.V. hydrocortisone may be used for severe infusion-related reactions.

Dosing: ElderlyRefer to adult dosing.

Dosing: Adjustment for ToxicityHematologic toxicity (severe neutropenia or thrombocytopenia, not autoimmune): **Note:** If delay between dosing is ≥7 days, restart at 3 mg/day and escalate as tolerated.

First occurrence: ANC <250/µL and/or platelet count ≤25,000/µL: Hold therapy; resume at 30 mg/dose when ANC ≥500/µL and platelet count ≥50,000/µL

Second occurrence: ANC <250/µL and/or platelet count ≤25,000/µL: Hold therapy; resume at 10 mg/dose when ANC ≥500/µL and platelet count ≥50,000/µL

Third occurrence: ANC <250/µL and/or platelet count ≤25,000/µL: Permanently discontinue therapy

Patients with a baseline ANC ≤250/µL and/or a baseline platelet count ≤25,000/µL at initiation of therapy: If ANC and/or platelet counts decrease to ≤50% of the baseline value, hold therapy

First occurrence: When ANC and/or platelet count return to baseline, resume therapy at 30 mg/dose

Second occurrence: When ANC and/or platelet count return to baseline, resume therapy at 10 mg/dose

Third occurrence: Permanently discontinue therapy

Calculations

- ANC: Absolute Neutrophil Count

Administration: I.V.Administer by I.V. infusion over 2 hours. Consider premedicating with diphenhydramine 50 mg and acetaminophen 500-1000 mg 30 minutes before initiation of infusion. Hydrocortisone 200 mg has been effective in decreasing severe infusion-related events. Start anti-infective prophylaxis. Other drugs should not be added to or simultaneously infused through the same I.V. line. Do not give I.V. push.

Administration: I.V. DetailpH: 6.8-7.4

Administration: OtherSubQ (unlabeled route): A longer dose escalation time (1-2 weeks) may be needed due to injection site reactions. Premedication and anti-infective prophylaxis regimens should be given as are recommended with I.V. administration.

StoragePrior to dilution, store at 2°C to 8°C (36°F to 46°F); do not freeze (if accidentally frozen, thaw in refrigerator prior to administration). Do not shake; protect from light. Following dilution, store at room temperature or refrigerate; protect from light; use within 8 hours.

ReconstitutionDilute with 100 mL NS or D_5W. Gently invert the bag to mix the solution. Do not shake prior to use.

CompatibilityMedications should not be added to the solution or simultaneously infused through the same I.V. line.

ContraindicationsThere are no contraindications listed in the manufacturer's labeling

Warnings/Precautions

Boxed warnings:

- Hematologic toxicity: See “Concerns related to adverse effects” below.
- Infections: See “Concerns related to adverse effects” below.
- Infusion reactions: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Hematologic toxicity: **[U.S. Boxed Warning]: Severe, prolonged myelosuppression, autoimmune anemia, and autoimmune thrombocytopenia have occurred.** Single doses >30 mg and cumulative weekly doses >90 mg are associated with an increased incidence of pancytopenia and should not be administered. Hemolytic anemia, pure red cell aplasia, bone marrow aplasia, and hypoplasia have also been reported. Median duration of neutropenia is 21 days; median duration of thrombocytopenia is 21 days. Discontinue therapy during serious hematologic or other serious toxicity (except lymphopenia) until the event resolves. Permanently discontinue if autoimmune anemia or autoimmune thrombocytopenia occurs. Patients receiving blood products should only receive irradiated blood products due to the potential for GVHD during lymphopenia.
- Infections: **[U.S. Boxed Warning]: Serious infections (bacterial, viral, fungal, and protozoan) have been reported. Prophylactic therapy against PCP pneumonia and herpes viral infections is recommended upon initiation of therapy** and for at least 2 months following last dose or until $CD4^+$ counts are ≥200 cells/µL (whichever is later). $CD4^+$ and $CD8^+$ lymphocyte counts may not return to baseline levels for more than 1 year. Withhold treatment during serious infections; may be reinitiated upon resolution of infection.
- Infusion reactions: **[U.S. Boxed Warning]: Serious and potentially fatal infusion-related reactions (acute respiratory distress syndrome, bronchospasm, cardiac arrest, cardiac arrhythmias, chills, fever, hypotension, myocardial infarction, pulmonary infiltrates, rash, rigors, shortness of breath, syncope) may occur,** especially during the first week of treatment. Premedication with acetaminophen and an oral antihistamine is recommended. Withhold infusion for grade 3 or 4 infusion reaction. Use caution and carefully monitor blood pressure in patients with ischemic heart disease and patients on antihypertensive therapy. Gradual escalation to the recommended maintenance dose is required at initiation and after interruption of therapy for ≥7 days to minimize infusion-related reactions.

Special populations:

- Men of reproductive potential: Should use effective contraceptive methods during treatment and for a minimum of 6 months following therapy.
- Pediatrics: Safety and efficacy have not been established in children.
- Women of childbearing potential: Should use effective contraceptive methods during treatment and for a minimum of 6 months following therapy.

Other warnings/precautions:

- Immunizations: Patients should not be immunized with live, viral vaccines during or recently after treatment. The ability to respond to any vaccine following therapy is unknown.

Pregnancy Risk FactorC

Pregnancy ConsiderationsHuman IgG is known to cross the placental barrier; therefore, alemtuzumab may also cross the barrier and cause fetal B- and T-lymphocyte depletion. Well-controlled human trials have not been done. Use during pregnancy only if the benefit to the mother outweighs the potential risk to the fetus. Effective contraception is recommended during and for 6 months after treatment for women of childbearing potential and men of reproductive potential.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsHuman IgG is excreted in breast milk; therefore, alemtuzumab may also be excreted in milk. Breast-feeding should be discontinued during treatment and for at least 3 months following the last dose.

Adverse Reactions

>10%:

- Cardiovascular: Hypotension (15% to 32%), peripheral edema (13%), hypertension (11% to 15%), dysrhythmia/tachycardia/SVT (10% to 14%)
- Central nervous system: Fever (69% to 85%), chills (53%), fatigue (22% to 34%), headache (13% to 24%), dysthesias (15%), dizziness (12%)
- Dermatologic: Rash (13% to 40%), urticaria (16% to 30%), pruritus (14% to 24%)
- Gastrointestinal: Nausea (47% to 54%), vomiting (33% to 41%), anorexia (20%), diarrhea (10% to 22%), stomatitis/mucositis (14%), abdominal pain (11%)
- Hematologic: Lymphopenia (grades 3/4: 97%), neutropenia (77% to 85%; grade 3/4: 42% to 70%; median duration: 28 days), anemia (76% to 80%; grade 3/4: 13% to 47%), thrombocytopenia (71% to 72%; grade 3/4: 13% to 52%; median duration: 21 days)
- Local: Injection site reaction (SubQ administration: 90%)
- Neuromuscular & skeletal: Rigors (86% to 89%), skeletal pain (24%), weakness (13%), myalgia (11%)
- Respiratory: Dyspnea (14% to 26%), cough (25%), bronchitis/pneumonitis (21%), pneumonia (16%), pharyngitis (12%)
- Miscellaneous: Infection (43% to 74%; grades 3/4: 21% to 37%; incidence is lower if prophylactic anti-infectives are utilized), CMV viremia (55%), infusion reactions (grades 3/4: 10% to 35%), diaphoresis (19%), CMV infection (16%), sepsis (15%), herpes viral infections (1% to 11%)

1% to 10%:

- Cardiovascular: Chest pain (10%)
- Central nervous system: Insomnia (10%), malaise (9%), anxiety (8%), depression (7%), temperature change sensation (5%), somnolence (5%)
- Dermatologic: Purpura (8%), erythema (4%)
- Gastrointestinal: Dyspepsia (10%), constipation (9%)
- Hematologic: Neutropenic fever (10%), pancytopenia/marrow hypoplasia (5% to 6%; grade 3/4: 3%), positive Coombs' test without hemolysis (2%), autoimmune thrombocytopenia (2%), autoimmune hemolytic anemia (1%)
- Neuromuscular & skeletal: Back pain (10%), tremor (3% to 7%)
- Respiratory: Bronchospasm (9%), epistaxis (7%), rhinitis (7%)
- Miscellaneous: Moniliasis (8%)

<1%, postmarketing, and/or case reports (limited to important or life-threatening): Acidosis, acute renal failure, acute respiratory distress syndrome, agranulocytosis, alkaline phosphatase increased, allergic reactions, anaphylactoid reactions, angina pectoris, angioedema, anuria, aphasia, aplastic anemia, arrhythmia, ascites, asthma, atrial fibrillation, bacterial infection, biliary pain, bone marrow aplasia, bullous eruption, capillary fragility, cardiac arrest, cardiac failure, cardiac insufficiency, cardiomyopathy, cellulitis, cerebral hemorrhage, cerebrovascular disorder, chronic inflammatory demyelinating polyradiculoneuropathy, coagulation abnormality, colitis, coma, COPD, coronary artery disorder, cyanosis, deep vein thrombosis, dehydration, diabetes mellitus exacerbation, disseminated intravascular coagulation (DIC), duodenal ulcer, ejection fraction decreased, endophthalmitis, Epstein-Barr virus associated lymphoproliferative disorder, esophagitis, fluid overload, flu-like syndrome, gastrointestinal hemorrhage, Goodpasture’s syndrome, Graves' disease, Guillain-Barré syndrome, hallucinations, hematemesis, hematoma, hematuria, hemolysis, hemolytic anemia, hemoptysis, hepatic failure, hepatocellular damage, hyperbilirubinemia, hyper-/hypoglycemia, hyper-/hypokalemia, hyperthyroidism, hypoalbuminemia, hyponatremia, hypovolemia, hypoxia, idiopathic thrombocytopenic purpura (ITP), interstitial pneumonitis, intestinal obstruction, intestinal perforation, intracranial hemorrhage, *Legionella* pneumonia, *Listeria* meningitis, lymphadenopathy, marrow depression, melena, MI, mouth edema, myositis, optic neuropathy, osteomyelitis, pancreatitis, paralysis, paralytic ileus, paroxysmal nocturnal hemoglobinuria-like monocytes, peptic ulcer, pericarditis, peritonitis, plasma cell dyscrasia, phlebitis, pleural effusion, pleurisy, *Pneumocystis jiroveci* pneumonia, pneumothorax, polymyositis, progressive multifocal leukoencephalopathy, pseudomembranous colitis, pulmonary edema, pulmonary embolism, pulmonary fibrosis, pulmonary infiltration, pure red cell aplasia, purpuric rash, renal dysfunction, respiratory alkalosis, respiratory arrest, respiratory depression, respiratory insufficiency, seizure (grand mal), serum sickness, splenic infarction, splenomegaly, stridor, subarachnoid hemorrhage, syncope, toxic nephropathy, thrombocythemia, thrombophlebitis, throat tightness, tuberculosis, tumor lysis syndrome, ureteric obstruction, urinary retention, urinary tract infection, ventricular arrhythmia, ventricular tachycardia, viral meningitis

Oncology: VesicantNo

Oncology: Emetic PotentialLow (10% to 30%)

Drug Interactions

Abciximab: May enhance the potential for allergic or hypersensitivity reactions to Monoclonal Antibodies. Also may cause thrombocytopenia or diminished therapeutic effects. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Echinacea may diminish the therapeutic effect of alemtuzumab.
Test InteractionsMay interfere with diagnostic serum tests that utilize antibodies.
Monitoring ParametersVital signs; carefully monitor BP especially in patient with ischemic heart disease or on antihypertensive medications; CBC with differential and platelets (weekly); signs and symptoms of infection; CD4$^+$ lymphocyte counts (after treatment until recovery). Monitor closely for infusion reactions (including hypotension, rigors, fever, shortness of breath, bronchospasm, chills, and/or rash).
Nursing: Physical Assessment/MonitoringSee Warnings/Precautions and Contraindications for extensive use cautions. Note preinfusion medication instructions (see Administration). Monitor closely for alterations in blood pressure (especially in patients with heart disease or on antihypertensive medications) and/or infusion-related reactions during and for several hours following infusion. Assess knowledge/teach patient to monitor closely for postinfusion adverse reactions, appropriate interventions to reduce side effects, and symptoms to report (see Patient Education). **Pregnancy risk C** - benefits of use should outweigh possible risks. Breast-feeding is contraindicated.
Monitoring: Lab TestsCBC with differential and platelets; CD4$^+$ lymphocyte counts
Patient EducationThis medication can only be administered I.V. During infusion, you will be closely monitored. You will need frequent laboratory tests during course of therapy. Do not use any prescription or OTC medications unless approved by your prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake, and nutrition (small, frequent meals will help). You may experience abdominal pain, mouth sores, nausea, or vomiting (small, frequent meals, good mouth care with soft toothbrush or swabs, sucking lozenges or chewing gum, and avoidance of spicy or salty foods may help). Report unresolved GI problems, persistent fever, chills, muscle pain, skin rash, unusual bleeding or bruising, signs of infection (mouth sores, sore throat, white plaques in mouth or perianal area, burning on urination); swelling of extremities; respiratory difficulty; chest pain or palpitations; or other persistent adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Campath®: 30 mg/mL (1 mL) [contains polysorbate 80; disodium edetate]

Generic AvailableNo
ManufacturerBerlex Laboratories, Inc
Mechanism of ActionBinds to CD52, a nonmodulating antigen present on the surface of B and T lymphocytes, a majority of monocytes, macrophages, NK cells, and a subpopulation of granulocytes. After binding to CD52$^+$ cells, an antibody-dependent lysis of leukemic cells occurs.
Pharmacodynamics/Kinetics

Distribution: V_d: 0.1-0.4 L/kg

Metabolism: Clearance decreases with repeated dosing (due to loss of CD52 receptors in periphery), resulting in a sevenfold increase in AUC.

Half-life elimination: 11 hours (following first 30 mg dose; range: 2-32 hours); 6 days (following the last 30 mg dose; range: 1-14 days)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis and mucositis.
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusFatigue is common; may cause dizziness, depression, insomnia
Mental Health: Effects on Psychiatric TreatmentHypotension is common; concurrent use with psychotropics may produce additive hypotensive effects; monitor. Nausea, vomiting, and diarrhea are common; may be additive when used with SSRIs; monitor. Neutropenia is common; use caution with clozapine and carbamazepine.
Index TermsC1H; Campath-1H; Humanized IgG1 Anti-CD52 Monoclonal Antibody; NSC-715969

Bisphosphonates: Safety Update Regarding Possible Association With Atrial Fibrillation - November 2008

The Food and Drug Administration (FDA) has been reviewing placebo-controlled trials of the 7 bisphosphonates currently marketed in the US. This review is in response to study results associating an increased incidence of atrial fibrillation (AF) with alendronate or zoledronic acid use in women (65-89 years of age) with osteoporosis.

The FDA reviewed all the submitted data (19,687 bisphosphonate-treated patients and 18,358 placebo-treated patients) from these studies. Overall, the occurrence of AF was rare in each study with an absolute difference in event rates between each of the bisphosphonate and placebo arms of 0-3 per 1000. A zoledronic acid study showed a statistically significant increase in the rate of AF in the active treatment arm. However, no clear association between bisphosphonate use and AF could be established. In this study, AF events were diagnosed more than 30 days after receiving zoledronic acid in 47 of the 50 patients diagnosed with AF. According to the FDA, healthcare providers should not alter their prescribing patterns for bisphosphonates and patients should not stop taking their medication.

The FDA will continue monitoring the safety of bisphosphonates through postmarketing reports and is assessing the need for additional epidemiologic studies.

Further information is available at http://www.fda.gov/cder/drug/early_comm/bisphosphonates_update_200811.htm

Bisphosphonates: Possible Association with Severe Musculoskeletal Pain - January 2008

The Food and Drug Administration (FDA) is informing healthcare practitioners of the possible association between bisphosphonate use and the development of severe (possibly incapacitating) bone, muscle, and/or joint pain. The severe musculoskeletal pain may develop days, months, or years after initiating a bisphosphonate. This is a distinct event from the acute phase response (eg, fever, chills, bone pain, myalgia, arthralgia) that may occur following initial bisphosphonate administration which generally resolves within several days of continued use.

Frequency of and contributing risk factors between severe musculoskeletal pain and bisphosphonate use are currently unknown.

Further information is available at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Bisphosphonates

Pronunciation (a LEN droe nate & kole e kal SI fer ole)

U.S. Brand Names Fosamax Plus D™

Canadian Brand Names Fosavance

Pharmacologic Category Bisphosphonate Derivative; Vitamin D Analog

Use: Labeled Indications Treatment of osteoporosis in postmenopausal females; increase bone mass in males with osteoporosis

Dosing: Adults **Osteoporosis:** Oral: One tablet (alendronate 70 mg/cholecalciferol 2800 int. units **or** alendronate 70 mg/cholecalciferol 5600 int. units) once weekly. Appropriate dose in most osteoporotic women or men: Alendronate 70 mg/cholecalciferol 5600 int. units once weekly.

Dosing: Elderly Refer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} 35-60 mL/minute: No adjustment needed.

Cl_{cr} <35 mL/minute: Not recommended.

Dosing: Hepatic Impairment Alendronate: None necessary. Cholecalciferol: May not be adequately absorbed in patients who have malabsorption due to inadequate bile production.

Calculations

- Creatinine Clearance: Adults

Administration: Oral Alendronate must be taken with plain water (6-8 oz) first thing in the morning and ≥30 minutes before the first food, beverage, or other medication of the day. Patient should be instructed to stay upright (not to lie down) for at least 30 minutes and until after first food of the day (to reduce esophageal irritation).

Dietary Considerations Ensure adequate calcium and vitamin D intake; supplemental calcium should be provided in patients whose dietary intake is inadequate. Recommended intake of vitamin D is 400-800 int. units daily. Certain patients may require additional vitamin D supplementation, particularly patients at risk for vitamin D deficiency (eg, malabsorption syndromes, chronically ill, >70 years of age).

Consider monitoring 25-hydroxy vitamin D in patients with malabsorption syndromes. Wait at least 30 minutes after taking alendronate with cholecalciferol before taking any supplement. Must be taken with at least 6-8 oz. plain water first thing in the morning and at least 30 minutes before the first food or beverage of the day. Administer with plain water only; do not administer with mineral-enriched water.

StorageStore at 20°C to 25°C (68°F to 77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from moisture and light. Keep sealed in blister container or original bottle (with desiccant) until use.

ContraindicationsHypersensitivity to alendronate, other bisphosphonates, vitamin D derivatives, or any component of the formulation; hypocalcemia; abnormalities of the esophagus which delay esophageal emptying such as stricture or achalasia; inability to stand or sit upright for at least 30 minutes

Warnings/Precautions

Concerns related to adverse effects:

- Bone/joint/muscle pain: Severe (and occasionally debilitating) bone, joint, and/or muscle pain have been reported during bisphosphonate treatment. The onset of pain ranged from a single day to several months. Symptoms usually resolve upon discontinuation. Some patients experienced recurrence when rechallenged with same drug or another bisphosphonate; avoid use in patients with a history of these symptoms in association with bisphosphonate therapy. Discontinue use if severe symptoms occur.

- Gastrointestinal mucosa irritation: May cause irritation to upper gastrointestinal mucosa. Esophagitis, esophageal ulcers, esophageal erosions, and esophageal stricture (rare) have been reported with oral bisphosphonates; risk increases in patients unable to comply with dosing instructions. Use with caution in patients with dysphagia, esophageal disease, gastritis, duodenitis, or ulcers (may worsen underlying condition).

- Osteonecrosis of the jaw: Bisphosphonate therapy has been associated with osteonecrosis, primarily of the jaw; this has been observed mostly in cancer patients, but also in patients with postmenopausal osteoporosis and other diagnoses. Risk factors include a diagnosis of cancer, with concomitant chemotherapy, radiotherapy, or corticosteroids; anemia, coagulopathy, infection or pre-existing dental disease. Symptoms included nonhealing extraction socket or an exposed jawbone. There are no data addressing whether discontinuation of therapy reduces the risk of developing osteonecrosis. However, as a precautionary measure, dental exams and preventative dentistry should be performed prior to placing patients with risk factors on chronic bisphosphonate therapy. Invasive dental procedures should be avoided during treatment.

Disease-related concerns:

- Gastrointestinal malabsorption syndrome: Increased doses of vitamin D supplementation may be required in patients with GI malabsorption syndrome; consider monitoring 25-hydroxy vitamin D levels.

- Hypercalcemia: May exacerbate hypercalcemia and/or hypercalciuria in certain disease states (eg, leukemia, lymphoma, sarcoidosis); monitor serum and urine calcium levels.

- Hypocalcemia/vitamin D deficiency: Before therapy initiation hypocalcemia and/or vitamin D deficiency must be corrected; ensure adequate calcium and vitamin D intake. Do not use to treat vitamin D deficiency.

- Renal impairment: Use with caution in patients with renal impairment (not recommended for use in patients with Cl_{cr} <35 mL/minute).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have shown delays in delivery and fetal/neonatal death (secondary to hypocalcemia). Bisphosphonates are incorporated into the bone matrix and gradually released over time. Theoretically, there may be a risk of fetal harm when pregnancy follows the completion of therapy. No animal data are available for the use of cholecalciferol in pregnancy; however, high-dose ergocalciferol has demonstrated abortifacient properties and aortic abnormalities in rabbits. There are no adequate and well-controlled studies in pregnant women.

LactationCholecalciferol enters breast milk; excretion of alendronate in breast milk unknown/use caution

Adverse ReactionsSee individual agents.

Drug Interactions

Aminoglycosides: May enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Bisphosphonate Derivatives. Antacids containing aluminum, calcium, or magnesium are of specific concern. **Exceptions:** Magaldrate; Sodium Bicarbonate. *Risk D: Consider therapy modification*

Aspirin: May enhance the adverse/toxic effect of Alendronate. Specifically gastrointestinal adverse events. *Risk C: Monitor therapy*

Calcium Salts: May decrease the absorption of Bisphosphonate Derivatives. *Risk D: Consider therapy modification*

Iron Salts: May decrease the absorption of Bisphosphonate Derivatives. Only oral iron salts are of concern. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Magnesium Salts: May decrease the absorption of Bisphosphonate Derivatives. Only oral magnesium salts are of concern. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Phosphate Supplements: Bisphosphonate Derivatives may enhance the hypocalcemic effect of Phosphate Supplements. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsSee individual agents.

Test InteractionsBisphosphonates may interfere with diagnostic imaging agents such as technetium-99m-diphosphonate in bone scans.

Monitoring ParametersAlkaline phosphatase (measured periodically); urine and serum calcium, serum phosphorus, serum 25-hydroxy vitamin D; monitor pain and fracture rate; hormonal status (male and female) prior to therapy; bone mineral density (should be done prior to initiation of therapy and after 6-12 months of combined glucocorticoid and alendronate treatment)

Reference Range

Calcium (total): Adults: 9.0-11.0 mg/dL (2.05-2.54 mmol/L), may slightly decrease with aging

Phosphorus: 2.5-4.5 mg/dL (0.81-1.45 mmol/L)

25-hydroxyvitamin D: 10-80 ng/mL (higher during summer)

Nursing: Physical Assessment/MonitoringSee individual agent for Alendronate.

Monitoring: Lab TestsAlkaline phosphatase (measured periodically); urine and serum calcium, serum phosphorus, serum 25-hydroxy vitamin D

Patient EducationSee individual agent for Alendronate.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Fosamax Plus D™ 70/2800: Alendronate 70 mg and cholecalciferol 2800 int. units

Fosamax Plus D™ 70/5600: Alendronate 70 mg and cholecalciferol 5600 int. units

Generic AvailableNo

Manufacturer

Merck and Co, Inc

Pricing: U.S. (www.drugstore.com)

Tablets (Fosamax Plus D)

70-2800 mg-unit (4): $86.99

70-5600 mg-unit (4): $82.99

Mechanism of ActionSee individual agents.

Related Information

- Alendronate
- Cholecalciferol

Dental Health Professional ConsiderationsSee Alendronate monograph.

Dental Health: Effects on Dental TreatmentOsteonecrosis of the jaw (ONJ), generally associated with local infection and/or tooth extraction and often with delayed healing, has been reported in patients taking bisphosphonates. Symptoms included nonhealing extraction socket or an exposed jawbone. Most reported cases of bisphosphonate-associated osteonecrosis have been in cancer patients treated with intravenous bisphosphonates. However, some have occurred in patients with postmenopausal osteoporosis taking oral bisphosphonates. Dental surgery may exacerbate ONJ. For patients requiring dental procedures, there are no data available to suggest whether discontinuation of bisphosphonate treatment reduces the risk of ONJ. Patients who develop ONJ while on bisphosphonate therapy should receive care by an oral surgeon. See Dental Comment in Alendronate monograph.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause irritability or sedation; rarely associated with psychosis

Mental Health: Effects on Psychiatric TreatmentSymptoms of overdose are similar to those associated with lithium side effects/toxicity and psychogenic polydipsia.

Index TermsAlendronate Sodium and Cholecalciferol; Cholecalciferol and Alendronate; Vitamin D_3 and Alendronate

Special Alerts

Bisphosphonates: Safety Update Regarding Possible Association With Atrial Fibrillation - November 2008

The Food and Drug Administration (FDA) has been reviewing placebo-controlled trials of the 7 bisphosphonates currently marketed in the US. This review is in response to study results associating an increased incidence of atrial fibrillation (AF) with alendronate or zoledronic acid use in women (65-89 years of age) with osteoporosis.

The FDA reviewed all the submitted data (19,687 bisphosphonate-treated patients and 18,358 placebo-treated patients) from these studies. Overall, the occurrence of AF was rare in each study with an absolute difference in event rates between each of the bisphosphonate and placebo arms of 0-3 per 1000. A zoledronic acid study showed a statistically significant increase in the rate of AF in the active treatment arm. However, no clear association between bisphosphonate use and AF could be established. In this study, AF events were diagnosed more than 30 days after receiving zoledronic acid in 47 of the 50 patients diagnosed with AF. According to the FDA, healthcare providers should not alter their prescribing patterns for bisphosphonates and patients should not stop taking their medication.

The FDA will continue monitoring the safety of bisphosphonates through postmarketing reports and is assessing the need for additional epidemiologic studies.

Further information is available at http://www.fda.gov/cder/drug/early_comm/bisphosphonates_update_200811.htm

Bisphosphonates: Possible Association with Severe Musculoskeletal Pain - January 2008

The Food and Drug Administration (FDA) is informing healthcare practitioners of the possible association between bisphosphonate use and the development of severe (possibly incapacitating) bone, muscle, and/or joint pain. The severe musculoskeletal pain may develop days, months, or years after initiating a bisphosphonate. This is a distinct event from the acute phase response (eg, fever, chills, bone pain, myalgia, arthralgia) that may occur following initial bisphosphonate administration which generally resolves within several days of continued use.

Frequency of and contributing risk factors between severe musculoskeletal pain and bisphosphonate use are currently unknown.

Further information is available at http://www.fda.gov/medwatch/safety/2008/safety08.htm#Bisphosphonates

Medication Safety Issues

Sound-alike/look-alike issues:

Fosamax® may be confused with Flomax®

International issues:

Fosamax® may be confused with Fisamox® which is a brand name for amoxicillin in Australia

Pronunciation(a LEN droe nate)

U.S. Brand NamesFosamax®

Canadian Brand NamesApo-Alendronate®; CO Alendronate; Dom-Alendronate; Fosamax®; Gen-Alendronate; Novo-Alendronate; PHL-Alendronate; PHL-Alendronate-FC; PMS-Alendronate; PMS-Alendronate-FC; ratio-Alendronate; Riva-Alendronate; Sandoz Alendronate

Pharmacologic CategoryBisphosphonate Derivative

Use: Labeled IndicationsTreatment and prevention of osteoporosis in postmenopausal females; treatment of osteoporosis in males; Paget's disease of the bone in patients who are symptomatic, at risk for future complications, or with alkaline phosphatase ≥2 times the upper limit of normal; treatment of glucocorticoid-induced osteoporosis in males and females with low bone mineral density who are receiving a daily dosage ≥7.5 mg of prednisone (or equivalent)

Dosing: Adults**Note:** Patients treated with glucocorticoids and those with Paget's disease should receive adequate amounts of calcium and vitamin D.

Osteoporosis in postmenopausal females: Oral:

Prophylaxis: 5 mg once daily **or** 35 mg once weekly

Treatment: 10 mg once daily **or** 70 mg once weekly

Osteoporosis in males: Oral: 10 mg once daily **or** 70 mg once weekly

Osteoporosis secondary to glucocorticoids in males and females: Oral: Treatment: 5 mg once daily; a dose of 10 mg once daily should be used in postmenopausal females who are not receiving estrogen.

Paget's disease of bone in males and females: Oral: 40 mg once daily for 6 months

Retreatment: Relapses during the 12 months following therapy occurred in 9% of patients who responded to treatment. Specific retreatment data are not available. Following a 6-month post-treatment evaluation period, treatment with alendronate may be considered in patients who have relapsed based on increases in serum alkaline phosphatase, which should be measured periodically. Retreatment may also be considered in those who failed to normalize their serum alkaline phosphatase.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} 35-60 mL/minute: None necessary.

Cl_{cr} <35 mL/minute: Alendronate is not recommended due to lack of experience.

Dosing: Hepatic ImpairmentNo adjustment necessary.

Calculations

- Creatinine Clearance: Adults

Administration: OralAlendronate must be taken with plain water (tablets 6-8 oz; oral solution follow with 2 oz) first thing in the morning and ≥30 minutes before the first food, beverage, or other medication of the day. Do not take with mineral water or with other beverages. Patients should be instructed to stay upright (not to lie down) for at least 30 minutes **and** until after first food of the day (to reduce esophageal irritation). Patients should receive supplemental calcium and vitamin D if dietary intake is inadequate.

Dietary ConsiderationsEnsure adequate calcium and vitamin D intake; however, wait at least 30 minutes after taking alendronate before taking any supplement. Alendronate must be taken with plain water first thing in the morning and at least 30 minutes before the first food or beverage of the day.

StorageStore tablets and oral solution at room temperature of 15°C to 30°C (59°F to 86°F). Keep in well-closed container.

ContraindicationsHypersensitivity to alendronate, other bisphosphonates, or any component of the formulation; hypocalcemia; abnormalities of the esophagus which delay esophageal emptying such as stricture or achalasia; inability to stand or sit upright for at least 30 minutes; oral solution should not be used in patients at risk of aspiration

Allergy Considerations

- Bisphosphonate Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Bone/joint/muscle pain: Severe (and occasionally debilitating) bone, joint, and/or muscle pain have been reported during bisphosphonate treatment. The onset of pain ranged from a single day to several months. Symptoms usually resolve upon discontinuation. Some patients experienced recurrence when rechallenged with same drug or another bisphosphonate; avoid use in patients with a history of these symptoms in association with bisphosphonate therapy. Discontinue use if severe symptoms occur.

- Gastrointestinal mucosa irritation: May cause irritation to upper gastrointestinal mucosa. Esophagitis, esophageal ulcers, esophageal erosions, and esophageal stricture (rare) have been reported with oral bisphosphonates; risk increases in patients unable to comply with dosing instructions. Use with caution in patients with dysphagia, esophageal disease, gastritis, duodenitis, or ulcers (may worsen underlying condition).

- Osteonecrosis of the jaw: Bisphosphonate therapy has been associated with osteonecrosis, primarily of the jaw; this has been observed mostly in cancer patients, but also in patients with postmenopausal osteoporosis and other diagnoses. Risk factors include a diagnosis of cancer, with concomitant chemotherapy, radiotherapy, or corticosteroids; anemia, coagulopathy, infection, or pre-existing dental disease. Symptoms included nonhealing extraction socket or an exposed jawbone. There are no data addressing whether discontinuation of therapy reduces the risk of developing osteonecrosis; however, as a precautionary measure, dental exams and preventative dentistry should be performed prior to placing patients with risk factors on chronic bisphosphonate therapy. Invasive dental procedures should be avoided during treatment.

Disease-related concerns:

- Hypocalcemia: Before therapy initiation hypocalcemia must be corrected; ensure adequate calcium and vitamin D intake.

- Renal impairment: Use with caution in patients with renal impairment (not recommended for use in patients with Cl_{cr} <35 mL/minute).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsSince many elderly patients receive diuretics, evaluation of electrolyte status (calcium, phosphate, magnesium, potassium) may need to be done periodically due to the drug class (bisphosphonate).

Pregnancy Risk FactorC

Pregnancy ConsiderationsSafety and efficacy have not been established in pregnant women. Animal studies have shown delays in delivery and fetal/neonatal death (secondary to hypocalcemia). Bisphosphonates are incorporated into the bone matrix and gradually released over time. Theoretically, there may be a risk of fetal harm when pregnancy follows the completion of therapy. Based on limited case reports with pamidronate, serum calcium levels in the newborn may be altered if administered during pregnancy.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions**Note:** Incidence of adverse effects (mostly GI) increases significantly in patients treated for Paget's disease at 40 mg/day.

>10%: Endocrine & metabolic: Hypocalcemia (transient, mild, 18%); hypophosphatemia (transient, mild, 10%)

1% to 10%:

Cardiovascular: Atrial fibrillation (1% to 2%)

Central nervous system: Headache (up to 3%)

Gastrointestinal: Abdominal pain (1% to 7%), acid reflux (1% to 4%), dyspepsia (1% to 4%), nausea (1% to 4%), flatulence (up to 4%), diarrhea (1% to 3%), gastroesophageal reflux disease (1% to 3%), constipation (up to 3%), esophageal ulcer (up to 2%), abdominal distension (up to 1%), gastritis (up to 1%), vomiting (up to 1%), dysphagia (up to 1%), gastric ulcer (1%), melena (1%)

Neuromuscular & skeletal: Musculoskeletal pain (up to 6%), muscle cramps (up to 1%)

<1%, postmarketing, and/or case reports: Alopecia, anastomotic ulcer, angioedema; bone, muscle, or joint pain (occasionally severe, considered incapacitating in rare cases); dizziness, duodenal ulcer, episcleritis, erythema, esophageal erosions, esophageal perforation, esophageal stricture, esophagitis, fever, flu-like syndrome, hypersensitivity reactions, hypocalcemia (symptomatic), joint swelling, lymphocytopenia, malaise, myalgia, oropharyngeal ulceration, osteonecrosis (jaw), peripheral edema, photosensitivity (rare), pruritus, rash, scleritis (rare), Stevens-Johnson syndrome, taste perversion, toxic epidermal necrolysis, urticaria, uveitis (rare), vertigo, weakness

Drug Interactions

Aminoglycosides: May enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Bisphosphonate Derivatives. Antacids containing aluminum, calcium, or magnesium are of specific concern. **Exceptions:** Magaldrate; Sodium Bicarbonate. *Risk D: Consider therapy modification*

Aspirin: May enhance the adverse/toxic effect of Alendronate. Specifically gastrointestinal adverse events. *Risk C: Monitor therapy*

Calcium Salts: May decrease the absorption of Bisphosphonate Derivatives. *Risk D: Consider therapy modification*

Iron Salts: May decrease the absorption of Bisphosphonate Derivatives. Only oral iron salts are of concern. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Magnesium Salts: May decrease the absorption of Bisphosphonate Derivatives. Only oral magnesium salts are of concern. *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Bisphosphonate Derivatives. Both an increased risk of gastrointestinal ulceration and an increased risk of nephrotoxicity are of concern. *Risk C: Monitor therapy*

Phosphate Supplements: Bisphosphonate Derivatives may enhance the hypocalcemic effect of Phosphate Supplements. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase risk of osteoporosis and gastric irritation).

Food: All food and beverages interfere with absorption. Coadministration with caffeine may reduce alendronate efficacy. Coadministration with dairy products may decrease alendronate absorption. Beverages (especially orange juice and coffee) and food may reduce the absorption of alendronate as much as 60%.

Test InteractionsBisphosphonates may interfere with diagnostic imaging agents such as technetium-99m-diphosphonate in bone scans.

Monitoring ParametersAlkaline phosphatase should be periodically measured; serum calcium and phosphorus; monitor pain and fracture rate; hormonal status (male and female) prior to therapy; bone mineral density (should be done prior to initiation of therapy and after 6-12 months of combined glucocorticoid and alendronate treatment)

Reference RangeCalcium (total): Adults: 9.0-11.0 mg/dL (2.05-2.54 mmol/L), may slightly decrease with aging; phosphorus: 2.5-4.5 mg/dL (0.81-1.45 mmol/L)

Nursing: Physical Assessment/MonitoringAssess history for any previous adverse response to bisphosphonates and ability to comply with administration instructions. Use caution with renal impairment. Correct any hypocalcemia prior to beginning treatment. Patients at risk for osteonecrosis (eg, chemotherapy, corticosteroids, poor oral hygiene) should have dental exams and necessary preventive dentistry should be done before beginning bisphosphonate therapy. Assess results of periodic laboratory tests, therapeutic effectiveness (eg, pain, fracture rate, bone density), and adverse reactions (eg, immediate or long-term musculoskeletal pain). Teach appropriate use and specific administration directions, lifestyle and dietary changes that will have a beneficial impact on Paget's disease or osteoporosis, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsAlkaline phosphatase should be periodically measured; serum calcium and phosphorus; hormonal status (male and female) prior to therapy; bone mineral density (should be done prior to initiation of therapy and after 6-12 months of combined glucocorticoid and alendronate treatment)

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed, with a full glass of water first thing in the morning and at least 30 minutes before the first food or beverage of the day. Wait at least 30 minutes after taking Alendronate before taking anything else. Stay in sitting or standing position for 30 minutes following administration and until after the first food of the day to reduce potential for esophageal irritation. Consult prescriber to determine necessity of lifestyle changes (eg, decreased smoking, decreased alcohol intake, dietary supplements of calcium or vitamin D). May cause flatulence, bloating, nausea, or acid regurgitation; small, frequent meals may help. Bone, joint, and/or muscle pain have been reported, especially at the beginning of treatment; report persistent pain to prescriber. Report acute headache or gastric pain, unresolved GI upset, or acid stomach. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, oral:

Fosamax®: 70 mg/75 mL [contains parabens; raspberry flavor]

Tablet: 5 mg, 10 mg, 35 mg, 40 mg, 70 mg

Fosamax®: 5 mg, 10 mg, 35 mg, 40 mg, 70 mg

Generic AvailableYes: Tablet

Pricing: U.S. (www.drugstore.com)

Solution (Fosamax)

70 mg/75 mL (75): $30.99

Tablets (Alendronate Sodium)

5 mg (100): $255.98

10 mg (100): $234.99

35 mg (4): $49.99

70 mg (4): $32.99

Tablets (Fosamax)

5 mg (30): $85.99

10 mg (30): $88.99

35 mg (4): $81.99

70 mg (4): $83.99

Mechanism of ActionA bisphosphonate which inhibits bone resorption via actions on osteoclasts or on osteoclast precursors; decreases the rate of bone resorption, leading to an indirect increase in bone mineral density. In Paget's disease, characterized by disordered resorption and formation of bone, inhibition of resorption leads to an indirect decrease in bone formation; but the newly-formed bone has a more normal architecture.

Pharmacodynamics/Kinetics

Distribution: 28 L (exclusive of bone)

Protein binding: ~78%

Metabolism: None

Bioavailability: Fasting: 0.6%; reduced 60% with food or drink

Half-life elimination: Exceeds 10 years

Excretion: Urine; feces (as unabsorbed drug)

Dental Health Professional ConsiderationsA report by the Council of Scientific Affairs of the American Dental Association [(accessed at: http://www.ada.org/prof/resources/topics/osteonecrosis.asp)](http://www.ada.org/prof/resources/topics/osteonecrosis.asp) as of July 2006 gave an estimated incidence of 0.7 cases for every 100,000 person-years of exposure to alendronate (Fosamax®). This translates to one case for every 142,857 person-years exposure. This figure from the ADA report was based on information received from Merck & Co citing 170 worldwide cases for alendronate (Fosamax®). In addition, Procter & Gamble Pharmaceuticals has cited 20 cases for risedronate (Actonel®) and Roche Laboratories has cited one case for ibandronate (Boniva®).

Consumer Reports On Health stated that the risk of jaw bone osteoporosis due to alendronate (Fosamax®), risedronate (Actonel®), or ibandronate (Boniva®) taken to prevent osteoporosis is very low and is estimated to be one out of every 20,000 users. That report mentioned that tooth extraction or implants increase the risk of developing osteonecrosis in patients taking any of these drugs for osteoporosis. The report also recommended that patients should stop taking any of these oral drugs 1-2 months before and after such dental treatment. No evidence was presented to support this statement.

In terms of length of exposure to oral bisphosphonates prior to onset of ONJ, data from large population studies or controlled studies is lacking. A report by Marx et al, observed that of three cases of ONJ associated with Fosamax® exposure, one patient had been taking 10 mg/day by mouth for 6 years and the other two patients 10 mg/day by mouth for 3 and 2 years respectively. In contrast, they observed that in cancer patients receiving intravenous bisphosphonates, the time period between the first doses of the bisphosphonate to first recognition of exposed bone either by the patients or by the clinician, was 9.4 months for zoledronate (Zometa®), 14.3 months for pamidronate (Aredia®), and 12.1 months for pamidronate then to zoledronate.

Information on Fosamax® use in Australia and the incidence of ONJ has been reported. A survey form was sent to all of the Australian members of the Australian and New Zealand Association of Oral and Maxillofacial Surgeons requesting cases that they had identified as ONJ in 2004 and 2005. The definition of ONJ for the survey was an area of exposed bone in the jawbones that failed to heal within 6 weeks in patients taking bisphosphonates for bone disease. The frequency of ONJ in osteoporotic patients mainly on weekly oral alendronate was 1 in 8470 to 1 in 2260 (0.01% to 0.04%) patients. If extractions were carried out, the calculated frequency was 1 in 1130 to 1 in 296 (0.09% to 0.34%) patients. The minimum values in these cases were determined from the survey whereas the maximum values were obtained from the extrapolation to the entire Australia of the South Australian survey data. The median time to onset of ONJ in alendronate patients was 24 months.

A study from a Harvard group, shows that there may be a decrease in the incidence of ONJ in Fosamax® users compared to the normal population, and adds new data to the concerns about the Fosamax® user and the risk of developing ONJ. This new study used medical claims data from 714,217 people with osteoporosis or cancer to identify diagnostic codes or procedural codes for inflammatory conditions of the jaw, including osteonecrosis. Oral administration of bisphosphonates (BPs) decreased the risk of inflammatory conditions of the jaw. At the same time, intravenous administration significantly increased the risk of adverse jaw outcomes. While the data from the oral BPs counters previous reports, the intravenous BP data were consistent with reports showing the increased risk of ONJ after intravenous BP use in cancer patients.

The study, published in the Journal of the American Dental Association (Cartsos, 2008), collected data from the medical claims for inflammatory condition of the jaw (defined by the study authors as osteonecrosis of the jaw bone), from 2000-2006. There were 150 claims per 176,889 patients taking oral BPs, giving a ratio of 0.85 claims per 1000 individuals. Among patients with no BP association, there were more claims (339 claims per 263,352 patients) giving a ration of 1.3 claims per 1000 individuals. When statistics were used to calculate significance with a 95% confidence level, there was a definite decrease in the incidence of jaw bone adverse effects in the population taking oral BPs compared with those patients who did not take oral BPS.

Dental Health: Effects on Dental TreatmentOsteonecrosis of the jaw (ONJ), generally associated with local infection and/or tooth extraction and often with delayed healing, has been reported in patients taking bisphosphonates. Symptoms included nonhealing extraction socket or an exposed jawbone. Most reported cases of bisphosphonate-associated osteonecrosis have been in cancer patients treated with intravenous bisphosphonates. However, some have occurred in patients with postmenopausal osteoporosis taking oral bisphosphonates. Dental surgery may exacerbate ONJ. For patients requiring dental procedures, there are no data available to suggest whether discontinuation of bisphosphonate treatment reduces the risk of ONJ. Patients who develop ONJ while on bisphosphonate therapy should receive care by an oral surgeon. See Dental Comment.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely cause dizziness, weakness, and malaise

Mental Health: Effects on Psychiatric TreatmentMay produce GI side effects; concomitant use with SSRIs, carbamazepine, valproic acid, and lithium may produce additive effects

Index TermsAlendronate Sodium

Medication Safety Issues

Sound-alike/look-alike issues:

Alfentanil may be confused with Anafranil®, fentanyl, remifentanil, sufentanil

Alfenta® may be confused with Sufenta®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drug classes which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(al FEN ta nil)

U.S. Brand NamesAlfenta®

Canadian Brand NamesAlfentanil Injection, USP; Alfenta®

Pharmacologic CategoryAnalgesic, Opioid; Anilidopiperidine Opioid

Use: Labeled IndicationsAnalgesic adjunct given by continuous infusion or in incremental doses in maintenance of anesthesia with barbiturate or N_2O or a primary anesthetic agent for the induction of anesthesia in patients undergoing general surgery in which endotracheal intubation and mechanical ventilation are required

Dosing: AdultsDoses should be titrated to appropriate effects; wide range of doses is dependent upon desired degree of analgesia/anesthesia

Anesthesia: I.V.: Dose should be based on ideal body weight as follows (see table).

Alfentanil

Indication	**Approx Duration of Anesthesia (min)**	**Induction Period (Initial Dose) (mcg/kg)**	**Maintenance Period (Increments/ Infusion)**	**Total Dose (mcg/kg)**	**Effects**
Incremental injection	≤30	8-20	3-5 mcg/kg or 0.5-1 mcg/kg/min	8-40	Spontaneously breathing or assisted ventilation when required.
	30-60	20-50	5-15 mcg/kg	Up to 75	Assisted or controlled ventilation required. Attenuation of response to laryngoscopy and intubation.
Continuous infusion	>45	50-75	0.5-3 mcg/kg/min; average infusion rate 1-1.5 mcg/kg/min	Dependent on duration of procedure	Assisted or controlled ventilation required. Some attenuation of response to intubation and incision, with intraoperative stability.
Anesthetic induction	>45	130-245	0.5-1.5 mcg/kg/min or general anesthetic	Dependent on duration of procedure	Assisted or controlled ventilation required. Administer slowly (over 3 minutes). Concentration of inhalation agents reduced by 30% to 50% for initial hour.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Children <12 years: Dose has not been established.

Children ≥12 years: Refer to adult dosing.

Calculations

- Ideal Body Weight: Adults

Administration: I.V.Administer I.V. slowly over 3-5 minutes or by I.V. continuous infusion.
Administration: I.V. DetailpH: 4-6
StorageStore unopened ampuls at 20°C to 25°C (68°F to 77°F). Protect from light. For infusion, dilute in D$_5$W, NS, LR, or D$_5$NS to a concentration of 25-80 mcg/mL.
CompatibilityStable in D$_5$W, NS, LR, D$_5$NS.

Y-site administration: Compatible: Cisatracurium, etomidate, gatifloxacin, linezolid, propofol, remifentanil. **Incompatible:** Amphotericin B cholesteryl sulfate complex, thiopental.

Compatibility in syringe: Compatible: Atracurium, midazolam, ondansetron.

RestrictionsC-II
ContraindicationsHypersensitivity to alfentanil hydrochloride, to narcotics, or any component of the formulation; increased intracranial pressure, severe respiratory depression

Allergy Considerations

- Opioid Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- Hypotension: May cause hypotension; use with caution in patients with hypovolemia, cardiovascular disease (including acute MI), or drugs which may exaggerate hypotensive effects (including phenothiazines or general anesthetics).

- Opioid agonist toxicities: Shares the toxic potentials of opiate agonists, and precautions of opiate agonist therapy should be observed.

Disease-related concerns:

- Bradyarrhythmias: Use with caution when administering to patients with bradyarrhythmias.

- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.

- Head trauma: Use with extreme caution in patients with head injury, intracranial lesions, or elevated intracranial pressure; exaggerated elevation of ICP may occur.

- Obesity: Use with caution in patients who are morbidly obese.

- Respiratory disease: Use with caution in patients with pre-existing respiratory compromise (hypoxia and/or hypercapnia), COPD or other obstructive pulmonary disease, and kyphoscoliosis or other skeletal disorder which may alter respiratory function.

Special populations:

- Neonates: Hypotension has occurred in neonates with respiratory distress syndrome.

- Pediatrics: Safety and efficacy have not been established in children <12 years old.

Other warnings/precautions:

- Rapid infusion: Inject slowly over 3-5 minutes; rapid I.V. infusion may result in skeletal muscle and chest wall rigidity, impaired ventilation, or respiratory distress/arrest; nondepolarizing skeletal muscle relaxant may be required.

- Trained individuals: Due to the high incidence of apnea, hypotension, tachycardia and muscle rigidity; it should be administered by individuals specifically trained in the use of anesthetic agents and should not be used in diagnostic or therapeutic procedures outside the monitored anesthesia setting; resuscitative and intubation equipment should be readily available.

Pregnancy Risk FactorC

Adverse Reactions

>10%:

Cardiovascular: Bradycardia, peripheral vasodilation

Central nervous system: Drowsiness, sedation, intracranial pressure increased

Gastrointestinal: Nausea, vomiting, constipation

Endocrine & metabolic: Antidiuretic hormone release

Ocular: Miosis

1% to 10%:

Cardiovascular: Cardiac arrhythmia, orthostatic hypotension

Central nervous system: Confusion, CNS depression

Ocular: Blurred vision

<1%: Convulsions, mental depression, paradoxical CNS excitation or delirium, dizziness, dysesthesia, rash, urticaria, itching, biliary tract spasm, urinary tract spasm, respiratory depression, bronchospasm, laryngospasm, physical and psychological dependence with prolonged use; cold, clammy skin

Metabolism/Transport Effects**Substrate** of CYP3A4 (major)
Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alvimopan: Analgesics (Opioid) may enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ammonium Chloride: May increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Amphetamines: May enhance the analgesic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Alfentanil. *Risk D: Consider therapy modification*

Antipsychotic Agents (Phenothiazines): May enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Beta-Blockers: Anilidopiperidine Opioids may enhance the bradycardic effect of Beta-Blockers. Anilidopiperidine Opioids may enhance the hypotensive effect of Beta-Blockers. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): Anilidopiperidine Opioids may enhance the bradycardic effect of Calcium Channel Blockers (Nondihydropyridine). Anilidopiperidine Opioids may enhance the hypotensive effect of Calcium Channel Blockers (Nondihydropyridine). *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Alfentanil. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Desmopressin: Analgesics (Opioid) may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Diltiazem: May increase the serum concentration of Alfentanil. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Alfentanil. *Risk D: Consider therapy modification*

Macrolide Antibiotics: May decrease the metabolism of Alfentanil. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

MAO Inhibitors: Anilidopiperidine Opioids may enhance the serotonergic effect of MAO Inhibitors. This could result in serotonin syndrome. Management: Avoid use of fentanyl (and other anilidopiperidine opioids when possible) in patients who have used a monoamine oxidase inhibitor within the past 14 days due to reports of unpredictable but severe adverse effects. *Risk D: Consider therapy modification*

Pegvisomant: Analgesics (Opioid) may diminish the therapeutic effect of Pegvisomant. *Risk C: Monitor therapy*

Propofol: Alfentanil may enhance the adverse/toxic effect of Propofol. Specifically the development of opisthotonus and/or grand mal seizures. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Alfentanil. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: Analgesics (Opioid) may enhance the serotonergic effect of Selective Serotonin Reuptake Inhibitors. This may cause serotonin syndrome. *Risk C: Monitor therapy*

Succinylcholine: May enhance the bradycardic effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Monitoring ParametersRespiratory rate, blood pressure, heart rate
Reference Range100-340 ng/mL (depending upon procedure)
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]: 500 mcg/mL (2 mL, 5 mL)

Alfenta®: 500 mcg/mL (2 mL, 5 mL, 10 mL, 20 mL)

Generic AvailableYes
Mechanism of ActionBinds with stereospecific receptors at many sites within the CNS, increases pain threshold, alters pain perception, inhibits ascending pain pathways; is an ultra short-acting narcotic

Pharmacodynamics/Kinetics

Onset of action: Rapid

Duration (dose dependent): 30-60 minutes

Distribution: V_d: Newborns, premature: 1 L/kg; Children: 0.163-0.48 L/kg; Adults: 0.46 L/kg

Half-life elimination: Newborns, premature: 5.33-8.75 hours; Children: 40-60 minutes; Adults: 83-97 minutes

Related Information

- Narcotic / Opioid Analgesics

Pharmacotherapy PearlsAlfentanil may produce more muscle rigidity compared to fentanyl, therefore, be sure to administer slowly.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Orthostatic hypotension.

Erythromycin inhibits the liver metabolism of alfentanil resulting in increased sedation and prolonged respiratory depression. Clarithromycin may act similarly.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation is common, may see depression or confusion, rarely may cause seizures or delirium

Mental Health: Effects on Psychiatric TreatmentCNS depressant and beta-blockers may increase toxicity; phenothiazines may antagonize analgesic effect

Anesthesia and Critical Care Concerns/Other ConsiderationsAlfentanil may produce more muscle rigidity compared to fentanyl, therefore, be sure to administer slowly.

Index TermsAlfentanil Hydrochloride

Alfuzosin

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(al FYOO zoe sin)
U.S. Brand NamesUroxatral®
Canadian Brand NamesXatral
Pharmacologic CategoryAlpha $_1$ Blocker
Use: Labeled IndicationsTreatment of the functional symptoms of benign prostatic hyperplasia (BPH)
Dosing: AdultsBenign prostatic hyperplasia (BPH): Oral: 10 mg once daily
Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentBioavailability and maximum serum concentrations are increased by ~50% with mild, moderate, or severe renal impairment.

Note: Safety has not been evaluated in patients with creatinine clearances <30 mL/minute.

Dosing: Hepatic Impairment

Mild hepatic impairment: Use has not been studied.

Moderate or severe hepatic impairment (Child-Pugh class B and C): Clearance is decreased $^1/_3$ to $^1/_4$ and serum concentration is increased three- to fourfold; use is contraindicated.

Calculations

- Creatinine Clearance: Adults

Administration: OralTablet should be swallowed whole; do not crush or chew. Administer once daily (with a meal); should be taken at the same time each day.
Dietary ConsiderationsTake following a meal at the same time each day.
StorageStore at room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from light and moisture.
ContraindicationsHypersensitivity to alfuzosin or any component of the formulation; moderate or severe hepatic insufficiency (Child-Pugh class B and C); concurrent use with potent CYP3A4 inhibitors (eg, itraconazole, ketoconazole, ritonavir)
Allergy Considerations

- Alpha-Blocker, Non-Quinazoline Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Angina: Discontinue if symptoms of angina occur or worsen.
- Floppy iris syndrome: Intraoperative floppy iris syndrome has been observed in cataract surgery patients who were on or were previously treated with alpha$_1$-blockers; causality has not been established and there appears to be no benefit in discontinuing alpha-blocker therapy prior to surgery.
- Orthostatic hypotension/syncope: May cause significant orthostatic hypotension and syncope, especially with first dose; anticipate a similar effect if therapy is interrupted for a few days, if dosage is rapidly increased, or used with antihypertensives (particularly vasodilators), PDE-5 inhibitors, nitrates or other medications which may result in hypotension. Patients should be cautioned about performing hazardous tasks when starting new therapy or adjusting dosage upward.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with mild hepatic impairment; contraindicated in moderate to severe impairment.
- Prostate cancer: Rule out prostatic carcinoma before beginning therapy (many symptoms of BPH and prostate cancer are similar).
- QT prolongation: Alfuzosin has been shown to prolong the QT interval alone (minimal) and with other drugs with comparable effects on the QT interval (additive). Use with caution in patients with known QT prolongation (congenital or acquired).
- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Pediatrics: Not indicated for use in children.

Other warning/precautions:

- Antihypertensive agent: Not intended for use as an antihypertensive drug.

Geriatric ConsiderationsAlfuzosin is a functionally uroselective alpha-blocker, therefore, having minimal effects on the cardiovascular system. Alfuzosin has been available in Europe for many years and appears to be well tolerated in elderly. In one study, orthostatic changes were minimal and not influenced by age.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies; however, alfuzosin is not indicated for use in women.

LactationNot indicated for use in women

Adverse Reactions

1% to 10%:

Central nervous system: Dizziness (6%), fatigue (3%), headache (3%), pain (1% to 2%)

Gastrointestinal: Abdominal pain (1% to 2%), constipation (1% to 2%), dyspepsia (1% to 2%), nausea (1% to 2%)

Genitourinary: Impotence (1% to 2%)

Respiratory: Upper respiratory tract infection (3%), bronchitis (1% to 2%), pharyngitis (1% to 2%), sinusitis (1% to 2%)

<1%: Hypotension, postural hypotension, syncope

Postmarketing and/or case reports: Angina pectoris (pre-existing CAD), angioedema, chest pain, cholestatic liver injury, diarrhea, edema, flushing, intraoperative floppy iris syndrome (with cataract surgery), priapism, pruritus, rash, rhinitis, tachycardia, urticaria

Metabolism/Transport Effects**Substrate** of CYP3A4 (major)

Drug Interactions

Alpha1-Blockers: May enhance the antihypertensive effect of Alfuzosin. Risk of orthostatic hypotension or syncope may be increased. Alfuzosin may enhance the antihypertensive effect of Alpha1-Blockers. *Risk X: Avoid combination*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Beta-Blockers: May enhance the orthostatic effect of Alpha1-Blockers. The risk associated with ophthalmic products is probably less than systemic products. **Exceptions:** Levobunolol; Metipranolol. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Alpha1-Blockers may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Phosphodiesterase 5 Inhibitors: May enhance the hypotensive effect of Alpha1-Blockers. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QTc-Prolonging Agents: Alfuzosin may enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Tamsulosin: Alpha1-Blockers may enhance the antihypertensive effect of Tamsulosin. Risk of orthostatic hypotension or syncope may be increased. Tamsulosin may enhance the antihypertensive effect of Alpha1-Blockers. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Food: Food increases the extent of absorption.

Herb/Nutraceutical: Avoid St John's wort (may decrease alfuzosin levels).

Monitoring ParametersUrine flow; blood pressure

Nursing: Physical Assessment/MonitoringProstatic carcinoma should be ruled out before beginning therapy. Assess for use cautions. Assess potential for interactions with other prescriptions, OTC medications, and herbal products patient may be taking. Monitor for patient response (eg, improved urine flow) and adverse reactions (hypotension) at beginning of therapy and on a regular basis with long-term therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy without consulting prescriber. Take exactly as directed, with a meal at the same time each day. Swallow tablet whole; do not crush or chew. May cause drowsiness, dizziness, impaired judgment (use caution when driving or engaging in tasks that require alertness until response to drug is known), or postural hypotension (use caution when rising from sitting or lying position or when climbing stairs). Report unusual chest pain, respiratory difficulty, or any persistent adverse reactions.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, extended release, as hydrochloride:

Uroxatral®: 10 mg

Generic AvailableNo

ManufacturerSanofi-Synthelabo, Inc

Pricing: U.S. (www.drugstore.com)

Tablet, 24-hour (Uroxatral)

10 mg (30): $97.91

Mechanism of ActionAn antagonist of alpha$_1$-adrenoreceptors in the lower urinary tract. Smooth muscle tone is mediated by the sympathetic nervous stimulation of alpha$_1$-adrenoreceptors, which are abundant in the prostate, prostatic capsule, prostatic urethra, and bladder neck. Blockade of these adrenoreceptors can cause smooth muscles in the bladder neck and prostate to relax, resulting in an improvement in urine flow rate and a reduction in BPH symptoms.

Pharmacodynamics/Kinetics

Absorption: Decreased 50% under fasting conditions

Distribution: V_d: 3.2 L/kg

Protein binding: 82% to 90%

Metabolism: Hepatic, primarily via CYP3A4; metabolism includes oxidation, O-demethylation, and N-dealkylation; forms metabolites (inactive)

Bioavailability: 49% following a meal

Half-life elimination: 10 hours

Time to peak, plasma: 8 hours following a meal

Excretion: Feces (69%); urine (24%; 11% as unchanged drug)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentAlfuzosin may cause orthostasis. Concomitant use with psychotropics may produce additive effects on blood pressure. Use caution with thioridazine and ziprasidone; may prolong QT interval. Use caution with nefazodone; may increase levels of alfuzosin resulting in toxicity.

Index TermsAlfuzosin Hydrochloride

International Brand NamesAlfetim (HN); Alfusin (IN); Dalfaz (AR, ES, PL); Uroxatral (CN); Uroxatral OD (AR, UY); Uroxatral uno (CH, DE); Xatral (AT, BE, BF, BJ, CH, CI, CL, CZ, DK, ET, FI, FR, GB, GH, GM, GN, GR, IE, IL, IT, KE, LR, MA, ML, MR, MU, MW, NE, NG, NL, NO, SC, SD, SE, SL, SN, TN, TZ, UG, ZA, ZM, ZW); Xatral LP (FR, HK); Xatral OD (BR, CO, CR, DO, EC, GT, HN, MX, NI, PA, PE, PH, PY, SE, SV, VE); Xatral SR (AT, BG, EE, EG, IL, PK, SG); Xatral XL (ID, IL, KP, SG, TH); Xatral XR 10 (SG)

Medication Safety Issues

Sound-alike/look-alike issues:

Alglucerase may be confused with agalsidase alfa, agalsidase beta, alglucosidase alfa

Ceredase® may be confused with Cerezyme®

Pronunciation(al GLOO ser ase)
U.S. Brand NamesCeredase®
Pharmacologic CategoryEnzyme
Use: Labeled IndicationsReplacement therapy for Gaucher's disease (type 1)
Dosing: AdultsGaucher's disease: I.V.: Initial: 30-60 units/kg every 2 weeks; dosing is individualized based on disease severity; average dose: 60 units/kg every 2 weeks. Range: 2.5 units/kg 3 times/week to 60 units/kg once weekly to every 4 weeks. Once patient response is well established, dose may be reduced every 3-6 months to determine maintenance therapy.
Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRefer to adult dosing.
Administration: I.V.Infuse I.V. over 1-2 hours; use of an in-line filter is recommended.
Administration: I.V. DetailEffective only via I.V. Filter during administration. Do not shake, shaking may render glycoprotein inactive. Dilute with NS only.
StorageRefrigerate (4°C), do not freeze. Contains no preservatives. Do not store opened vials for future use. Once diluted, 100 mL and 200 mL solutions for infusion are stable for 18 hours when stored at 2°C to 8°C.
ReconstitutionDilute with NS to a final volume ≤200 mL. Do not shake.
CompatibilityStable in NS; do not mix with any other additives.
ContraindicationsHypersensitivity to any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Hypersensitivity reactions: Patients who develop IgG antibodies may be at a higher risk for developing hypersensitivity. Use with caution in patients with prior allergies to hCG.

Disease-related concerns:

- Androgen-sensitive malignancies: Use with caution in patients with androgen-sensitive malignancies.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <2 years of age (limited experience). May cause early virilization in males <10 years of age.

Dosage form specific issues:

- Placental tissue: Prepared from pooled human placental tissue that may contain the causative agents of some viral diseases.

Pregnancy Risk FactorC
Pregnancy ConsiderationsAnimal studies have not been conducted.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Cardiovascular: Peripheral edema

Central nervous system: Chills, fatigue, fever, headache, lightheadedness

Endocrine & metabolic: Hot flashes, menstrual abnormalities

Gastrointestinal: Abdominal discomfort, diarrhea, nausea, oral ulcerations, vomiting

Local: Injection site: Abscess, burning, discomfort, pruritus, swelling

Neuromuscular & skeletal: Backache, weakness

Miscellaneous: Dysosmia; hypersensitivity reactions (abdominal cramping, angioedema, chest discomfort, flushing, hypotension, nausea, pruritus, respiratory symptoms, urticaria); IgG antibody formation (~13%)

Drug InteractionsThere are no known significant interactions.
Test InteractionsFalse-positive pregnancy tests

Monitoring ParametersCBC, platelets, liver function tests, IgG antibody formation, acid phosphatase (AP); MRI or CT of liver and spleen, skeletal x-rays, physical exam every 6-12 months

Nursing: Physical Assessment/MonitoringUse caution with androgen-sensitive malignancies or prior allergies to hCG. Assess results of laboratory tests and therapeutic effectiveness (eg, energy level, change in bleeding tendency, reduced joint swelling, or bone pain). Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsCBC, platelets, acid phosphatase (AP), plasma glucocerebroside, IgG antibody formation

Patient EducationInform prescriber of all prescriptions, OTC medications, or herbal products you are taking, and any allergies you have. Do not take any new medication during therapy unless approved by prescriber. This medication will not cure Gaucher's disease, but rather, may help control it. Treatment is required for life. May cause abdominal discomfort, nausea, or vomiting (small, frequent meals, good mouth care, chewing gum, or sucking lozenges may help); these symptoms should go away with continued use. Inform prescriber if pain, swelling, or redness occurs at injection site or if GI symptoms persist. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Ceredase®: 80 units/mL (5 mL) [contains human albumin 1%]

Generic AvailableNo

Mechanism of ActionAlglucerase is a modified form of glucocerebrosidase; it is prepared from human placental tissue. Glucocerebrosidase is an enzyme deficient in Gaucher's disease. It is needed to catalyze the hydrolysis of glucocerebroside to glucose and ceramide.

Pharmacodynamics/KineticsHalf-life elimination: ~3-11 minutes

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsGlucocerebrosidase

Medication Safety Issues

Sound-alike/look-alike issues:

Alglucosidase alfa may be confused with agalsidase alfa, agalsidase beta, alglucerase

Pronunciation(al gloo KOSE i dase AL fa)

U.S. Brand NamesMyozyme®

Pharmacologic CategoryEnzyme

Use: Labeled IndicationsReplacement therapy for Pompe disease (infantile onset)

Dosing: PediatricReplacement therapy for Pompe disease (infantile onset): Children 1 month to 3.5 years (at first infusion): I.V.: 20 mg/kg over ~4 hours every 2 weeks

Administration: I.V.Infuse over ~4 hours; initiate at 1 mg/kg/hour. If tolerated, increase by 2 mg/kg/hour every 30 minutes to a maximum rate of 7 mg/kg/hour. Decrease rate or temporarily hold for infusion reactions. Infuse through a low protein-binding, 0.2 micron in-line filter.

StorageStore vials between 2°C and 8°C (36°F and 46°F); do not freeze. Protect from light. Allow vials to reach room temperature prior to reconstitution. Final solutions for infusion should be used immediately if possible, but may be stored for up to 24 hours between 2°C and 8°C (36°F and 46°F); do not freeze. Protect from light.

ReconstitutionReconstitute each vial with 10.3 mL SWFI. Inject slowly down internal side wall of vial (do not inject into powder; avoid foaming). Roll and tilt gently; do not invert, swirl, or shake. Resulting solution contains 5 mg/mL. To make final infusion, add the desired amount of reconstituted solution (based on patient weight) to 50-600 mL NS (do not use filter needle to prepare) to a final concentration of 0.5-4 mg/mL. Remove airspace from infusion bag prior to admixture to minimize particle formation due to sensitivity of drug to air-liquid interfaces. Do not shake.

CompatibilityStable in NS; do not infuse with other products.

ContraindicationsHypersensitivity to alglucosidase alfa or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Anaphylaxis/hypersensitivity reactions: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: **[U.S. Boxed Warning]: Severe hypersensitivity reactions, including anaphylactic reactions and anaphylactic shock have been reported during infusion. Immediate medical support should be readily available.**

- Infusion reactions: Infusion-related reactions are common; discontinue immediately for severe hypersensitivity or anaphylactic reaction; mild-to-moderate reactions may be managed by reducing the infusion rate and/or administering antihistamines and/or antipyretics. Appropriate medical support for the management of infusion reactions should be readily available. Use caution with subsequent infusions; infusion reactions have occurred despite premedication with antihistamines, antipyretics, and/or steroids. Patients with acute underlying illness are at greater risk for infusion reactions.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease; may increase risk of infusion related reactions. Arrhythmias have been observed in patients with cardiac hypertrophy.

- Pompe disease: Safety and efficacy have not been established in juvenile-onset and adult-onset Pompe disease. Patients with Pompe disease are at increased risk for infusion-related cardiorespiratory failure (possibly due to fluid overload); monitor closely during infusion.

- Respiratory disease: Use with caution in patients with respiratory disease; may increase risk of infusion related reactions. Cardiorespiratory failure has been observed in patients with cardiac hypertrophy.

Other warnings/precautions:

- Registry: A registry has been created to monitor therapeutic responses and adverse effects during long-term treatment; patients should be encouraged to register (www.pompperegistry.com or 1-800-745-4447).

Pregnancy Risk FactorB

Pregnancy ConsiderationsAnimal studies have not demonstrated teratogenicity or fertility impairment. There are no adequate and well-controlled studies in pregnant women. A registry has been established for Pompe patients; women of childbearing potential are encouraged to enroll in the registry (www.pompperegistry.com or 1-800-745-4447).

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsA registry has been established for Pompe patients; women who are nursing are encouraged to enroll in the registry (www.pomperegistry.com or 1-800-745-4447)

Adverse Reactions

>20%:

Cardiovascular: Tachycardia (23%), bradycardia (21%), flushing (21%)

Central nervous system: Fever (92%), pain (postprocedural: 26%)

Dermatologic: Rash (54%), diaper dermatitis (36%), urticaria (21%)

Gastrointestinal: Diarrhea (62%), vomiting (49%), gastroenteritis (41%), oral candidiasis (31%), gastroesophageal reflux (26%), constipation (23%)

Hematologic: Anemia (31%)

Local: Catheter-related infections (28%)

Otic: Otitis media (33% to 44%)

Respiratory: Cough (46%), pneumonia (46%), upper respiratory tract infection (44%), oxygen saturation decreased (41%), pharyngitis (36%), respiratory distress (33%), respiratory failure (31%), rhinorrhea (28%), bronchiolitis (23%), nasopharyngitis (23%), tachypnea (23%)

Miscellaneous: Infusion reaction (51%)

≤20%, frequency not reported, and/or case reports: Abdominal pain, agitation, anaphylactic reactions, bronchospasm, cardiorespiratory failure, cyanosis, erythema, face edema, facial erythema, fluid overload, headache, hyperhidrosis, hypersensitivity, hyper-/hypotension, irritability, lacrimation increased, livedo reticularis, malaise, nausea, pallor, periorbital edema, pruritus, respiratory syncytial virus infection, restlessness, retching, rhinitis, rigors, tremor, wheezing

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersLiver enzymes (baseline and periodically; elevation may be due to disease process); vital signs during and following infusion; volume overload

Nursing: Physical Assessment/MonitoringPatient must be monitored closely during and following infusion for hypersensitivity reactions; life-threatening anaphylactic reactions (including anaphylactic shock) have been reported during infusion. Emergency response equipment should be readily available. Premedication with antihistamines and/or antipyretics may be ordered. Prescriber should be notified of any adverse reaction. Decrease rate or temporarily hold for infusion reaction. Teach patient/caregiver possible side effects and adverse symptoms to report. **Note:** A registry has been established for Pompe patients; women who are of childbearing potential or nursing should be encouraged to enroll in the registry.

Monitoring: Lab TestsLiver enzymes (baseline and periodically; elevation may be due to disease process)

Patient EducationThis medication can only be administered by intravenous infusion. Report immediately any redness, swelling, pain, or burning at infusion site, or any adverse response during infusion (eg, respiratory difficulty, facial edema, pain, restlessness, tremor, wheezing). Report rash, diarrhea or constipation; nausea or vomiting, change in appetite, mouth sores; respiratory distress, cough, respiratory tract infection or other adverse response that occurs between infusions. **Pregnancy/breast-feeding precautions:** Consult prescriber if you are or intend to be pregnant or breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]:

Myozyme®: 50 mg [contains mannitol 210 mg; polysorbate 80; derived from Chinese hamster ovary cells]

Generic AvailableNo

ManufacturerGenzyme Corporation

Mechanism of ActionAlglucosidase alfa is a recombinant form of the enzyme acid alpha-glucosidase (GAA), which is required for glycogen cleavage. Due to an inherited GAA deficiency, glycogen accumulates in the tissues of patients with Pompe disease, leading to progressive muscle weakness. In infantile-onset Pompe disease, glycogen accumulates in cardiac and skeletal muscles and hepatic tissue, leading to cardiomyopathy and respiratory failure. Juvenile- and adult-onset Pompe disease are limited to glycogen accumulation in skeletal muscle, leading to respiratory failure. Alglucosidase alfa binds to mannose-6-phosphate receptors on the cell surface, becomes internalized and transported to lysosomes resulting in increased enzymatic activity and glycogen cleavage.

Pharmacodynamics/Kinetics

Distribution: V_{ss}: 80-112 mL/kg

Half-life elimination: 2.3 hours

Pharmacotherapy PearlsPatients with sustained positive IgG antibody titers (≥12,800) to alglucosidase alfa may have poorer clinical response. Most patients (89%) develop antibodies within the first 3 months of therapy; concern is with patients with sustained high (≥12,800) antibody titers. Patients developing a decreased motor function should be tested for neutralization of enzyme uptake or activity. Infusion reactions are more common in antibody-positive patients. Patients with moderate-to-severe or recurrent reactions with suspected mast-cell activation may be tested for alglucosidase-alfa specific IgE antibodies.

Index TermsAlglucosidase; GAA; rhGAA

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(a lis KYE ren & hye droe klor oh THYE a zide)

U.S. Brand NamesTekturna HCT®

Pharmacologic CategoryDiuretic, Thiazide; Renin Inhibitor

Use: Labeled IndicationsTreatment of hypertension (not recommended for initial treatment)

Dosing: AdultsHypertension: Oral: One tablet daily; dosage must be individualized (see below). May be substituted for previously titrated dosages of the individual components. Titrate at 2- to 4-week intervals as necessary.

Patients not controlled with single-agent therapy: Initiate by adding the lowest available dose of the alternative component (aliskiren 150 mg or hydrochlorothiazide 12.5 mg); titrate to effect (maximum daily aliskiren dose: 300 mg; maximum daily hydrochlorothiazide dose: 25 mg)

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNot recommended in patients with Cl_{cr} <30 mL/minute

Dosing: Hepatic ImpairmentDosage adjustment not required.

Calculations

- Creatinine Clearance: Adults

Administration: OralAdminister with or without meals.

Dietary ConsiderationsTake with or without meals; a high-fat meal reduces aliskiren absorption substantially.

StorageStore at 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to hydrochlorothiazide, thiazides, or sulfonamide-derived drugs; anuria

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Angioedema: Since the effect of aliskiren on bradykinin levels is unknown, the risk of kinin-mediated etiologies of angioedema occurring is also unknown. Use caution in any patient with a history of angioedema (of any etiology) as angioedema has been observed (rarely) with aliskiren use. Discontinue immediately following any signs and symptoms of angioedema.

- Electrolyte disturbances: Hyperkalemia may occur with renin inhibitors; risk factors include renal dysfunction, diabetes mellitus, and concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely. Thiazide diuretics may cause hypokalemia, hypochloremic alkalosis, hypomagnesemia, and hyponatremia.

- Hypersensitivity reactions: Hypersensitivity reactions may occur with hydrochlorothiazide. Risk is increased in patients with a history of allergy or bronchial asthma.

- Hypotension: During the initiation of therapy, symptomatic hypotension may occur (rarely), particularly in volume- or salt-depleted patients.

- Photosensitivity: Due to the hydrochlorothiazide component photosensitization may occur.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure); deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Aortic/mitral stenosis: Use with caution in patients with significant aortic/mitral stenosis.

- Diabetes: Use hydrochlorothiazide with caution in patients with prediabetes or diabetes mellitus; may see a change in glucose control.

- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated by hydrochlorothiazide.

- Hepatic impairment: Use caution in patients with hepatic impairment. Avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.

- Hypercholesterolemia: Use with caution in patients with moderate or high cholesterol concentrations; increased cholesterol and triglyceride levels have been reported with thiazides.

- Hypovolemia: Avoid use or use a smaller dose in patients who are volume depleted; correct depletion first.

- Renal artery stenosis: There has been no experience in treating patients with renal artery stenosis; use aliskiren with caution in patients with unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use with caution in patients with renal impairment; not recommended in patients with severe renal impairment (Cl_{cr} <30 mL/minute). Avoid hydrochlorothiazide in severe renal disease (ineffective); may precipitate azotemia; discontinue or consider withholding if renal impairment occurs.

- Systemic lupus erythematosus (SLE): Hydrochlorothiazide can cause SLE exacerbation or activation.

Concurrent drug therapy:

- High potential for interactions: use caution in patients taking strong inhibitors of P-glycoprotein (eg, cyclosporine); concomitant therapy with cyclosporine is not recommended.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, drugs that act on the angiotensin system can cause injury and death to the developing fetus when used in the second and third trimesters. Aliskiren should be discontinued as soon as possible once pregnancy is detected.**

Pregnancy Risk FactorD
Pregnancy ConsiderationsSee individual agents.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsSee individual agents.
Adverse ReactionsFrequencies reported with combination product. See individual monographs for additional adverse effects reported with each agent.

>10%: Renal: BUN increased (12%)

1% to 10%:

Central nervous system: Dizziness (2%), vertigo (1%)

Endocrine & metabolic: Hypokalemia (2%), uric acid level increased (2%)

Gastrointestinal: Diarrhea (2%)

Hepatic: ALT increased (1%)

Neuromuscular & skeletal: Arthralgia (1%), weakness (1%)

Respiratory: Cough (1%)

Miscellaneous: Flu-like syndrome (2%)

<1% (Limited to important or life-threatening): Hematocrit decreased, hemoglobin decreased, hyperkalemia

Note: Angioedema and periorbital edema have been reported with aliskiren. Severe dermatologic reactions and pancreatitis have been reported with hydrochlorothiazide.

Metabolism/Transport EffectsSee individual agents.
Drug Interactions

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Atorvastatin: May increase the serum concentration of Aliskiren. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

CycloSPORINE: May increase the serum concentration of Aliskiren. *Risk X: Avoid combination*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Furosemide: Aliskiren may decrease the serum concentration of Furosemide. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ketoconazole: May increase the serum concentration of Aliskiren. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Monitoring ParametersBlood pressure; serum electrolytes, BUN, serum creatinine; fluid status

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsSerum electrolytes, BUN, serum creatinine

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Tekturna HCT®:

150/12.5: Aliskiren 150 mg and hydrochlorothiazide 12.5 mg

150/25: Aliskiren 150 mg and hydrochlorothiazide 25 mg

300/12.5: Aliskiren 300 mg and hydrochlorothiazide 12.5 mg

300/25: Aliskiren 300 mg and hydrochlorothiazide 25 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Tablets (Tekturna HCT)

300-25 mg (30): $91.78

Mechanism of ActionAliskiren is a direct renin inhibitor, resulting in blockade of the conversion of angiotensinogen to angiotensin I. Angiotensin I suppression decreases the formation of angiotensin II (Ang II), a potent blood pressure-elevating peptide (via direct vasoconstriction, aldosterone release, and sodium retention). Hydrochlorothiazide inhibits sodium reabsorption in the distal tubules causing increased excretion of sodium and water as well as potassium and hydrogen ions.

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Aliskiren
- Hydrochlorothiazide

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Orthostatic hypotension

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentConcomitant use with psychotropics (especially those with significant alpha-adrenergic blocking properties) may produce additive hypotensive effects; monitor. Hydrochlorothiazide is used to treat lithium-induced diabetes insipidus; monitor for hypokalemia. May also decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels.

Index TermsAliskiren Hemifumarate and Hydrochlorothiazide; Hydrochlorothiazide and Aliskiren

Medication Safety Issues

International issues:

Aliskiren may be confused with Aliseum which is a brand name for diazepam in Italy

Pronunciation(a lis KYE ren)

U.S. Brand NamesTekturna®

Canadian Brand NamesRasilez®

Pharmacologic CategoryRenin Inhibitor

Use: Labeled IndicationsTreatment of hypertension, alone or in combination with other antihypertensive agents

Use: Unlabeled/InvestigationalTreatment of persistent proteinuria in patients with type 2 diabetes mellitus, hypertension, and nephropathy despite administration of optimized recommended renoprotective therapy (eg, angiotensin II receptor blocker)

Dosing: AdultsHypertension: Initial: 150 mg once daily; may increase to 300 mg once daily (maximum: 300 mg/day). **Note:** Prior to initiation, correct hypovolemia and/or closely monitor volume status in patients on concurrent diuretics during treatment initiation.

Dosing: ElderlyRefer to adult dosing. No initial dosage adjustment required.

Dosing: PediatricChildren <18 years: Dosage not established.

Dosing: Renal Impairment

Mild-to-moderate impairment [GFR >30 mL/minute and/or S_{cr} <1.7 mg/dL (women); S_{cr} <2 mg/dL (men)]: No dose adjustment required

Severe impairment [GFR<30 mL/minute and/or S_{cr} >1.7 mg/dL (women); S_{cr} >2 mg/dL (men)]: Use caution; not studied in severe renal impairment

Dosing: Hepatic ImpairmentNo dosage adjustment required.

Administration: OralAdminister at the same time daily; may take with or without a meal, but consistent administration with regards to meals is recommended. Avoid taking with high-fat meals.

Dietary ConsiderationsMay be taken with or without food; however, a high-fat meal reduces absorption

StorageStore at 15°C to 30°C (59°F to 86°F). Protect from moisture.

Contraindications

U.S. labeling: There are no contraindications listed in manufacturer's labeling.

Canada labeling: Hypersensitivity to aliskiren or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Angioedema: Since the effect of aliskiren on bradykinin levels is unknown, the risk of kinin-mediated etiologies of angioedema occurring is also unknown. Use caution in any patient with a history of angioedema (of any etiology) as angioedema has been observed (rarely) with aliskiren use. Discontinue immediately following any signs and symptoms of angioedema. Prolonged frequent monitoring may be required especially if tongue, glottis, or larynx are involved as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Aggressive early and appropriate management is critical.

- Hyperkalemia: May occur (rarely) during monotherapy; risk may increase in patients with predisposing factors (eg, renal dysfunction, diabetes mellitus or concomitant use with ACE inhibitors, potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts).

- Hypotension: During the initiation of therapy, symptomatic hypotension may occur (rarely), particularly in patients with an activated renin-angiotensin system (ie, volume or salt-depleted patients)

Disease-related concerns:

- Renal impairment: Use with caution in patients with severe renal impairment; not studied in patients with severe renal impairment [GFR <30 mL/minute and/or S_{cr} >1.7 mg/dL (women); S_{cr} >2 mg/dL (men)], history of dialysis, nephrotic syndrome, or renovascular hypertension. Use with caution or avoid in patients with deteriorating renal function or renal artery stenosis (bilateral or unilateral).

Concurrent drug therapy issues:

- High potential for interactions: Use caution in patients taking strong inhibitors of P-glycoprotein (eg, cyclosporine).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.
- Pregnancy: **[U.S. Boxed Warning]: Based on human data, drugs that act on the angiotensin system can cause injury and death to the developing fetus when used in the second and third trimesters. Aliskiren should be discontinued as soon as possible once pregnancy is detected.**

Geriatric ConsiderationsThe pharmacokinetic studies in elderly (≥65 years of age) demonstrated an increased AUC; however, adjustments in starting dose are not necessary. Blood pressure response and adverse effects were similar to younger adults in studies where 19% of patients were >65 years of age.

Pregnancy Risk FactorC (1st trimester); D (2nd and 3rd trimesters)

Pregnancy ConsiderationsMedications which act on the renin-angiotensin system are reported to have the following fetal/neonatal effects: Hypotension, neonatal skull hypoplasia, anuria, renal failure, and death; oligohydramnios is also reported. These effects are reported to occur with exposure during the second and third trimesters. There are no adequate and well-controlled studies in pregnant women. **[U.S. Boxed Warning]: Based on human data, drugs that act on the renin-angiotensin system can cause injury and death to the developing fetus when used in the second and third trimesters. Aliskiren should be discontinued as soon as possible once pregnancy is detected.**

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

1% to 10%:

Central nervous system: Dizziness (2%)

Dermatologic: Rash (1%)

Endocrine & metabolic: Hyperkalemia (monotherapy ≤1%; concurrent with ACE inhibitor in patients with diabetes 6%)

Gastrointestinal: Diarrhea (1% to 2%)

Hematologic: Creatine kinase increased (>300%: 1%)

Renal: BUN increased (≤7%), serum creatinine increased (≤7%)

Respiratory: Cough (1%)

<1%, postmarketing, and/or case reports: Abdominal pain, anemia, angina, angioedema, dyspepsia, gastroesophageal reflux, gout, hypotension (severe), myositis, renal stone formation, rhabdomyolysis, seizure, uric acid increased

Metabolism/Transport Effects**Substrate** of CYP3A4 (minor)

Drug Interactions

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Atorvastatin: May increase the serum concentration of Aliskiren. *Risk C: Monitor therapy*

CycloSPORINE: May increase the serum concentration of Aliskiren. *Risk X: Avoid combination*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Furosemide: Aliskiren may decrease the serum concentration of Furosemide. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Ketoconazole: May increase the serum concentration of Aliskiren. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: High-fat meals decrease absorption.

Monitoring ParametersBlood pressure; serum potassium, BUN, serum creatinine

Nursing: Physical Assessment/MonitoringEvaluate renal status prior to beginning therapy. Assess potential for adverse interactions with other pharmacological agents and herbal products patient may be taking (eg, increased risk for hyperkalemia). Assess results of laboratory tests (BUN, serum potassium, serum creatinine), therapeutic effectiveness (reduction in hypertension), and adverse response (eg, angioedema, hypotension) at beginning of therapy, when changing dose, and on a regular basis during long-term therapy. Teach patient proper use, possible side effects/interventions, and adverse symptoms to report.

Monitoring: Lab TestsSerum potassium, BUN, serum creatinine

Patient EducationDo not take any new prescription or over-the-counter medications or herbal products during therapy unless approved by prescriber. Take exactly as directed at same time each day; may be taken with meals. This drug does not eliminate the need for diet or exercise regimen as recommended by prescriber. May cause dizziness (use caution when driving or engaging in tasks that require alertness until response to drug is known) or hypotension (especially at beginning of therapy) (use caution when rising from lying or sitting position or climbing stairs). Report immediately any unusual swelling of eyes, face, lips, mouth, throat, or any difficulty swallowing of breathing; changes in urinary pattern; palpitations or irregular heartbeat; or any other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber for appropriate contraceptive measures if necessary or if you suspect you might be pregnant. Breast-feeding not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Tekturna®: 150 mg, 300 mg

Generic AvailableNo

ManufacturerNovartis

Pricing: U.S. (www.drugstore.com)

Tablets (Tekturna)

150 mg (30): $75.67

300 mg (30): $95.13

Mechanism of ActionAliskerin is a direct renin inhibitor, resulting in blockade of the conversion of angiotensinogen to angiotensin I. Angiotensin I suppression decreases the formation of angiotensin II (Ang II), a potent blood pressure-elevating peptide (via direct vasoconstriction, aldosterone release, and sodium retention). Ang II also functions within the Renin-Angiotensin-Aldosterone System (RAAS) as a negative inhibitory feedback mediator within the renal parenchyma to suppress the further release of renin. Thus, reductions in Ang II levels suppress this feedback loop, leading to further increased plasma renin concentrations (PRC) and subsequent activity (PRA). This disinhibition effect can be potentially problematic for ACE inhibitor and ARB therapy, as increased PRA could partially overcome the pharmacologic inhibition of the RAAS. As aliskiren is a direct inhibitor of renin activity, blunting of PRA despite the increased PRC (from loss of the negative feedback) may be clinically advantageous. The effect of aliskiren on bradykinin levels is unknown.

Pharmacodynamics/Kinetics

Onset of action: Maximum antihypertensive effect: Within 2 weeks

Absorption: Poor; absorption decreased by high-fat meal. Aliskiren is a substrate of P-glycoprotein; concurrent use of P-glycoprotein inhibitors may increase absorption.

Metabolism: Extent of metabolism unknown; *in vitro* studies indicate metabolism via CYP3A4

Bioavailability: ~3%

Half-life elimination: ~24 hours (range: 16-32 hours)

Time to peak, plasma: 1-3 hours

Excretion: Urine (~25% of absorbed dose excreted unchanged in urine); feces (unchanged via biliary excretion)

Related Information

- Angiotensin Agents

Dental Health: Effects on Dental TreatmentNo significant effects or complications required

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness

Mental Health: Effects on Psychiatric TreatmentConcomitant use with psychotropics (especially those with significant alpha-adrenergic blocking properties) may produce additive hypotensive effects.

Medication Safety Issues

Sound-alike/look-alike issues:

Panretin® may be confused with pancreatin

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(a li TRET i noyn)

U.S. Brand NamesPanretin®

Canadian Brand NamesPanretin®

Pharmacologic CategoryAntineoplastic Agent, Miscellaneous; Retinoic Acid Derivative

Use: Labeled Indications**Orphan drug:** Topical treatment of cutaneous lesions in AIDS-related Kaposi's sarcoma

Use: Unlabeled/InvestigationalCutaneous T-cell lymphomas

Dosing: Adults

Kaposi's sarcoma: Topical: Apply gel twice daily to cutaneous lesions.

T-cell lymphomas (unlabeled use): Topical: Apply gel twice daily to cutaneous lesions.

Dosing: ElderlyRefer to adult dosing.

Administration: TopicalDo not use occlusive dressings.

StorageStore at room temperature.

ContraindicationsHypersensitivity to alitretinoin, other retinoids, or any component of the formulation; pregnancy

Allergy Considerations

- Retinoid Allergy

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Photosensitivity: May be photosensitizing (based on experience with other retinoids); minimize sun or other UV exposure of treated areas.

Concurrent drug therapy issues:

- Products containing DEET: Do not use concurrently with topical products containing DEET.

Special populations:

- Elderly: Safety has not been established in the elderly.
- Pediatrics: Safety has not been established in children.
- Pregnancy: May cause fetal harm if absorbed by a woman who is pregnant.

Pregnancy Risk FactorD

Pregnancy ConsiderationsPotentially teratogenic and/or embryotoxic; limb, craniofacial, or skeletal defects have been observed in animal models. If used during pregnancy or if the patient becomes pregnant while using alitretinoin, the woman should be advised of potential harm to the fetus. Women of childbearing potential should avoid becoming pregnant.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsExcretion in human breast milk is unknown; women are advised to discontinue breast-feeding prior to using this medication.

Adverse Reactions

>10%:

Central nervous system: Pain (0% to 34%)

Dermatologic: Rash (25% to 77%), pruritus (8% to 11%)

Neuromuscular & skeletal: Paresthesia (3% to 22%)

5% to 10%:

Cardiovascular: Edema (3% to 8%)

Dermatologic: Exfoliative dermatitis (3% to 9%), skin disorder (0% to 8%)

Oncology: Emetic PotentialVery low (<10%)

Drug InteractionsThere are no known significant interactions.

Nursing: Physical Assessment/MonitoringAssess effectiveness of therapy and adverse reactions at beginning and periodically during therapy. Teach patient appropriate use/application, need to avoid DEET-containing insect repellents, and adverse symptoms to report.

Patient EducationFor external use only. Use exactly as directed; do not overuse. Avoid use of any product such as insect repellents which contain DEET (check with your pharmacist). Wear protective clothing and/or avoid exposure to direct sun or sunlamps. Wash hands thoroughly before applying. Avoid applying skin products that contain alcohol or harsh chemicals during treatment. Do not apply occlusive dressings. Stop treatment and inform prescriber if rash, skin irritation, redness, scaling, or excessive dryness appears. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptive measures. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Gel:

Panretin®: 0.1% (60 g)

Generic AvailableNo

ManufacturerLigand Pharmaceuticals, Inc

Mechanism of ActionBinds to retinoid receptors to inhibit growth of Kaposi's sarcoma

Pharmacodynamics/KineticsAbsorption: Not extensive

Related Information

Medication Safety Issues

Sound-alike/look-alike issues:

Allopurinol may be confused with Apresoline

Zyloprim® may be confused with Xylo-Pfan®, ZORprin®

Pronunciation(al oh PURE i nole)

U.S. Brand NamesAloprim™; Zyloprim®

Canadian Brand NamesAlloprin®; Apo-Allopurinol®; Novo-Purol; Zyloprim®

Pharmacologic CategoryXanthine Oxidase Inhibitor

Use: Labeled Indications

Oral: Prevention of attack of gouty arthritis and nephropathy; treatment of secondary hyperuricemia which may occur during treatment of tumors or leukemia; prevention of recurrent calcium oxalate calculi

I.V.: Treatment of elevated serum and urinary uric acid levels when oral therapy is not tolerated in patients with leukemia, lymphoma, and solid tumor malignancies who are receiving cancer chemotherapy

Dosing: AdultsDoses >300 mg should be given in divided doses.

Gout: Oral: Mild: 200-300 mg/day; Severe: 400-600 mg/day; to reduce the possibility of acute gouty attacks, initiate dose at 100 mg/day and increase weekly to recommended dosage. Maximum daily dose: 800 mg/day.

Secondary hyperuricemia associated with chemotherapy:

Oral: 600-800 mg/day in 2-3 divided doses for prevention of acute uric acid nephropathy for 2-3 days starting 1-2 days before chemotherapy

I.V.: 200-400 mg/m^2/day (maximum: 600 mg/day)

Note: Intravenous daily dose can be given as a single infusion or in equally divided doses at 6-, 8-, or 12-hour intervals. A fluid intake sufficient to yield a daily urinary output of at least 2 L in adults and the maintenance of a neutral or, preferably, slightly alkaline urine are desirable.

Recurrent calcium oxalate stones: 200-300 mg/day in single or divided doses

Dosing: ElderlyOral: Initial: 100 mg/day; increase until desired uric acid level is obtained. Refer to adult dosing.

Dosing: Pediatric

Gout: Children >10 years: Refer to adult dosing.

Recurrent calcium oxalate stones: Children >10 years: Refer to adult dosing.

Secondary hyperuricemia associated with chemotherapy:

Oral: Children ≤10 years: 10 mg/kg/day in 2-3 divided doses **or** 200-300 mg/m^2/day in 2-4 divided doses, maximum: 800 mg/24 hours, for prevention of acute uric acid nephropathy (begin 1-2 days before chemotherapy)

Alternative (manufacturer labeling):

<6 years: 150 mg/day in 3 divided doses

6-10 years: 300 mg/day in 2-3 divided doses

>10 years: Refer to adult dosing.

I.V.:

Children ≤10 years: Starting dose: 200 mg/m^2/day

Note: Intravenous daily dose can be given as a single infusion or in equally divided doses at 6-, 8-, or 12-hour intervals. Adequate fluid intake and the maintenance of a neutral or, preferably, slightly alkaline urine are desirable.

Children >10 years: Refer to adult dosing.

Dosing: Renal Impairment

Oral: Must be adjusted due to accumulation of allopurinol and metabolites; see table.

Adult Maintenance Doses of Allopurinol[1]

Creatinine Clearance (mL/min)	Maintenance Dose of Allopurinol (mg)
140	400 daily
120	350 daily
100	300 daily
80	250 daily
60	200 daily
40	150 daily
20	100 daily
10	100 every 2 days
0	100 every 3 days

[1] This table is based on a standard maintenance dose of 300 mg of allopurinol per day for a patient with a creatinine clearance of 100 mL/min.

I.V.:

Cl_{cr} 10-20 mL/minute: Administer 200 mg/day.

Cl_{cr} 3-10 mL/minute: Administer 100 mg/day.

Cl_{cr} <3 mL/minute: Administer 100 mg/day at extended intervals.

Hemodialysis: Administer dose after hemodialysis or administer 50% supplemental dose.

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Infuse over 15-60 minutes. The rate of infusion depends on the volume of the infusion. Whenever possible, therapy should be initiated at 24-48 hours before the start of chemotherapy known to cause tumor lysis (including adrenocorticosteroids). I.V. daily dose can be administered as a single infusion or in equally divided doses at 6-, 8-, or 12-hour intervals.

Administration: OralShould be administered after meals with plenty of fluid.

Dietary ConsiderationsShould administer oral forms after meals with plenty of fluid. Fluid intake should be administered to yield neutral or slightly alkaline urine and an output of ~2 L (in adults).

Storage

Powder for injection: Store at controlled room temperature of 15°C to 30°C (59°F to 86°F). Following reconstitution, intravenous solutions should be stored at 20°C to 25°C. Do not refrigerate reconstituted and/or diluted product. Must be administered within 10 hours of solution preparation.

Tablet: Store at controlled room temperature of 15°C to 25°C (59°F to 77°F).

ReconstitutionFurther dilution with NS or D_5W (50-100 mL) to ≤6 mg/mL is recommended.

CompatibilityStable in D_5W, NS, sterile water for injection.

Y-site administration: Compatible: Acyclovir, aminophylline, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, cefazolin, cefoperazone, cefotetan, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, cisplatin, co-trimoxazole, cyclophosphamide, dactinomycin, dexamethasone sodium phosphate, doxorubicin liposome, enalaprilat, etoposide, famotidine, fluconazole, fludarabine, fluorouracil, furosemide, ganciclovir, heparin, hydrocortisone sodium phosphate, hydrocortisone sodium succinate, hydromorphone, ifosfamide, lorazepam, mannitol, mesna, methotrexate, metronidazole, mitoxantrone, morphine, piperacillin, plicamycin, potassium chloride, ranitidine, thiotepa, ticarcillin, ticarcillin/clavulanate, vancomycin, vinblastine, vincristine, zidovudine. **Incompatible:** Amikacin, amphotericin B, carmustine, cefotaxime, chlorpromazine, cimetidine, clindamycin, cytarabine, dacarbazine, daunorubicin, diphenhydramine, doxorubicin, doxycycline, droperidol, floxuridine, gentamicin, haloperidol, hydroxyzine, idarubicin, imipenem/cilastatin, mechlorethamine, meperidine, methylprednisolone sodium succinate, metoclopramide, minocycline, nalbuphine, netilmicin, ondansetron, prochlorperazine edisylate, promethazine, sodium bicarbonate, streptozocin, tobramycin, vinorelbine.

Extemporaneously PreparedCrush tablets to make a 5 mg/mL suspension in simple syrup; stable 14 days under refrigeration

Nahata MC and Hipple TF, *Pediatric Drug Formulations*, 1st ed, Harvey Whitney Books Co, 1990.

ContraindicationsHypersensitivity to allopurinol or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Allergic reaction: Has been associated with a number of hypersensitivity reactions, including severe reactions (vasculitis and Stevens-Johnson syndrome); discontinue at first sign of rash.
- Bone marrow suppression: Has been reported; use caution with other drugs causing myelosuppression.
- Hepatotoxicity: Reversible hepatotoxicity has been reported; use with caution in patients with pre-existing hepatic impairment.

Disease-related concerns:

- Asymptomatic hyperuricemia: Do not use to treat asymptomatic hyperuricemia.
- Renal impairment: Use with caution in patients with renal impairment; may be at increased risk for hypersensitivity reactions. Dosage adjustments needed.

Concurrent drug therapy issues:

- ACE inhibitors: The risk of hypersensitivity may be increased in patients receiving ACE inhibitors.
- Amoxicillin/ampicillin: Risk of skin rash may be increased in patients receiving amoxicillin or ampicillin.
- Azathioprine/mercaptopurine: Use with caution in patients taking mercaptopurine or azathioprine; dosage adjustment necessary.
- Diuretics: Use with caution in patients taking diuretics concurrently. The risk of hypersensitivity may be increased in patients receiving thiazides.

Geriatric ConsiderationsAdjust dose based on renal function.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are few reports describing the use of allopurinol during pregnancy; no adverse fetal outcomes attributable to allopurinol have been reported in humans; use only if potential benefit outweighs the potential risk to the fetus.

LactationEnters breast milk/use caution (AAP rates “compatible”)

Adverse Reactions

>1%:

Dermatologic: Rash (increased with ampicillin or amoxicillin use, 1.5% per manufacturer, >10% in some reports)

Gastrointestinal: Nausea (1.3%), vomiting (1.2%)

Renal: Renal failure/impairment (1.2%)

<1%: Hypersensitivity syndrome, alkaline phosphatase or hepatic transaminases increased, granulomatous hepatitis, dyspepsia, pancreatitis, gynecomastia, agranulocytosis, aplastic anemia, acute tubular necrosis, interstitial nephritis, nephrolithiasis, vasculitis, toxic epidermal necrolysis, exfoliative dermatitis, Stevens-Johnson syndrome, granuloma annulare, toxic pustuloderma, peripheral neuropathy, neuritis, paresthesia, bronchospasm, cataracts, macular retinitis, angioedema, epistaxis

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

ACE Inhibitors: May enhance the potential for allergic or hypersensitivity reactions to Allopurinol. *Risk D: Consider therapy modification*

Amoxicillin: Allopurinol may enhance the potential for allergic or hypersensitivity reactions to Amoxicillin. *Risk C: Monitor therapy*

Ampicillin: Allopurinol may enhance the potential for allergic or hypersensitivity reactions to Ampicillin. *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Allopurinol. **Exceptions:** Sodium Bicarbonate. *Risk D: Consider therapy modification*

AzaTHIOprine: Allopurinol may decrease the metabolism of AzaTHIOprine. *Risk D: Consider therapy modification*

CarBAMazepine: Allopurinol may increase the serum concentration of CarBAMazepine. *Risk C: Monitor therapy*

ChlorproPAMIDE: Allopurinol may increase the serum concentration of ChlorproPAMIDE. *Risk C: Monitor therapy*

Cyclophosphamide: Allopurinol may enhance the adverse/toxic effect of Cyclophosphamide. Specifically, bone marrow suppression. *Risk C: Monitor therapy*

Didanosine: Allopurinol may decrease the metabolism of Didanosine. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the adverse/toxic effect of Allopurinol. Loop Diuretics may increase the serum concentration of Allopurinol. Specifically, Loop Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Mercaptopurine: Allopurinol may decrease the metabolism of Mercaptopurine. *Risk D: Consider therapy modification*

Pivampicillin: Allopurinol may enhance the potential for allergic or hypersensitivity reactions to Pivampicillin. *Risk C: Monitor therapy*

Theophylline Derivatives: Allopurinol may increase the serum concentration of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Thiazide Diuretics: May enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Allopurinol may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Ethanol: May decrease effectiveness.

Iron supplements: Hepatic iron uptake may be increased.

Vitamin C: Large amounts of vitamin C may acidify urine and increase kidney stone formation.

Monitoring ParametersCBC, serum uric acid levels, I & O, hepatic and renal function, especially at start of therapy

Reference RangeUric acid, serum: An increase occurs during childhood

Adults:

Male: 3.4-7 mg/dL or slightly more

Female: 2.4-6 mg/dL or slightly more

Values >7 mg/dL are sometimes arbitrarily regarded as hyperuricemia, but there is no sharp line between normals on the one hand, and the serum uric acid of those with clinical gout. Normal ranges cannot be adjusted for purine ingestion, but high purine diet increases uric acid. Uric acid may be increased with body size, exercise, and stress.

Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor laboratory values, effectiveness of therapy, and adverse reactions at beginning of therapy and periodically with long-term use. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report. considerations.

Monitoring: Lab TestsCBC, serum uric acid levels, hepatic and renal function, especially at start of therapy

Patient EducationTake as directed. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. While using this medication, do not use alcohol, other prescriptions, OTC medications, or vitamins without consulting prescriber. You may experience drowsiness (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, or heartburn (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or hair loss (reversible). Report immediately skin rash or lesions; painful urination or blood in urine or stool; pain or irritation of the eyes; swelling of lips, mouth, or tongue. Also report unusual fatigue; easy bruising or bleeding; yellowing of skin or eyes; any change in color of urine or stool; unresolved nausea or vomiting; or numbness of extremities. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as sodium: 500 mg

Aloprim™: 500 mg

Tablet: 100 mg, 300 mg

Zyloprim®: 100 mg, 300 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Zyloprim)

100 mg (30): $23.99

300 mg (30): $44.98

Mechanism of ActionAllopurinol inhibits xanthine oxidase, the enzyme responsible for the conversion of hypoxanthine to xanthine to uric acid. Allopurinol is metabolized to oxypurinol which is also an inhibitor of xanthine oxidase; allopurinol acts on purine catabolism, reducing the production of uric acid without disrupting the biosynthesis of vital purines.

Pharmacodynamics/Kinetics

Onset of action: Peak effect: 1-2 weeks

Absorption: Oral: ~80%; Rectal: Poor and erratic

Distribution: V_d: ~1.6 L/kg; V_{ss}: 0.84-0.87 L/kg; enters breast milk

Protein binding: <1%

Metabolism: ~75% to active metabolites, chiefly oxypurinol

Bioavailability: 49% to 53%

Half-life elimination:

Normal renal function: Parent drug: 1-3 hours; Oxypurinol: 18-30 hours

End-stage renal disease: Prolonged

Time to peak, plasma: Oral: 30-120 minutes

Excretion: Urine (76% as oxypurinol, 12% as unchanged drug)

Allopurinol and oxypurinol are dialyzable

Related Information

Medication Safety Issues

Sound-alike/look-alike issues:

Axert™ may be confused with Antivert®

Pronunciation(al moh TRIP tan)

U.S. Brand NamesAxert™

Canadian Brand NamesAxert™

Pharmacologic CategoryAntimigraine Agent; Serotonin 5-HT$_{1B, 1D}$ Receptor Agonist

Use: Labeled IndicationsAcute treatment of migraine with or without aura

Dosing: AdultsMigraine: Oral: Initial: 6.25-12.5 mg in a single dose; if the headache returns, repeat the dose after 2 hours; no more than 2 doses in 24-hour period

Note: If the first dose is ineffective, diagnosis needs to be re-evaluated. Safety of treating more than 4 migraines/month has not been established.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentInitial: 6.25 mg in a single dose; maximum daily dose: ≤12.5 mg

Dosing: Hepatic ImpairmentInitial: 6.25 mg in a single dose; maximum daily dose: ≤12.5 mg

Dietary ConsiderationsMay be taken without regard to meals

StorageStore at 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to almotriptan or any component of the formulation; use as prophylactic therapy for migraine; hemiplegic or basilar migraine; cluster headache; known or suspected ischemic heart disease (angina pectoris, MI, documented silent ischemia, coronary artery vasospasm, Prinzmetal's variant angina); peripheral vascular syndromes (including ischemic bowel disease); uncontrolled hypertension; use within 24 hours of another 5-HT$_1$ agonist; use within 24 hours of ergotamine derivative; concurrent administration or within 2 weeks of discontinuing an MAO inhibitor (specifically MAO type A inhibitors)

Allergy Considerations

- Serotonin 5-HT$_{1B,1D}$ Receptor Agonist Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Cardiac events: Coronary artery vasospasm, transient ischemia, myocardial infarction, ventricular tachycardia/fibrillation, cardiac arrest, and death have been reported with 5-HT$_1$ agonist administration. Patients who experience sensations of chest pain/pressure/tightness or symptoms suggestive of angina following dosing should be evaluated for coronary artery disease or Prinzmetal's angina before receiving additional doses.
- Cerebrovascular events: Cerebral/subarachnoid hemorrhage and stroke have been reported with 5-HT$_1$ agonist administration.
- Elevated blood pressure: Significant elevation in blood pressure, including hypertensive crisis, has also been reported on rare occasions in patients with and without a history of hypertension.
- Vasospasm-related events: Peripheral vascular ischemia and colonic ischemia have been reported with 5-HT$_1$ agonist. administration.

Disease-related concerns:

- Coronary artery disease: Should not be given to patients who have risk factors for CAD (eg, hypertension, hypercholesterolemia, smoker, obesity, diabetes, strong family history of CAD, menopause, male >40 years of age) without adequate cardiac evaluation. Patients with suspected CAD should have cardiovascular evaluation to rule out CAD before considering use; if cardiovascular evaluation “is satisfactory”, first dose should be given in the healthcare provider's office. Periodic evaluation of cardiovascular status should be done in all patients.
- Hepatic impairment: Use with caution in patients with hepatic impairment. Drug clearance may be reduced leading to increased plasma concentrations; dosage reduction is recommended.
- Renal impairment: Use with caution in patients with moderate to severe renal failure.

Concurrent drug therapy issues:

- Serotonin syndrome: Symptoms of agitation, confusion, hallucinations, hyper-reflexia, myoclonus, shivering, and tachycardia may occur with concomitant proserotonergic drugs (ie, SSRIs/SNRIs or triptans) or agents which reduce almotriptan's metabolism. Concurrent use of serotonin precursors (eg, tryptophan) is not recommended.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <18 years of age.

Other warnings/precautions:

- Appropriate use: Only indicated for treatment of acute migraine; if a patient does not respond to the first dose, the diagnosis of migraine should be reconsidered.

Geriatric ConsiderationsUse cautiously in elderly, particularly since many have cardiovascular disease, which would put them at risk for cardiovascular adverse effects. Safety and efficacy in elderly patients >65 years of age have not been established.

Pregnancy Risk FactorC

Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Use in pregnancy should be limited to situations where benefit outweighs risk to fetus. In some (but not all) animal studies, administration was associated with embryolethality, fetal malformations, and decreased pup weight.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

1% to 10%:

Central nervous system: Headache (>1%), dizziness (>1%), somnolence (>1%)

Gastrointestinal: Nausea (1% to 2%), xerostomia (1%)

Neuromuscular & skeletal: Paresthesia (1%)

<1%: Abdominal cramps, abdominal pain, abnormal coordination, anxiety, arthralgia, arthritis, back pain, bronchitis, chest pain, chills, colitis, conjunctivitis, coronary artery vasospasm, creatine phosphokinase increased, depressive symptoms, dermatitis, diaphoresis, diarrhea, diplopia, dream changes, dry eyes, dysmenorrhea, dyspepsia, dyspnea, ear pain, epistaxis, erythema, esophageal reflux, euphoria, eye irritation, eye pain, fatigue, fever, gastritis, gastroenteritis, GGTP increased, hyperacusis, hypercholesterolemia, hyperglycemia, hyperreflexia, hypertension, hypertonia, hyperventilation, hypoesthesia, impaired concentration, insomnia, laryngismus, laryngitis, muscular weakness, myalgia, myocardial ischemia, MI, myopathy, neck pain, nervousness, neuropathy, nightmares, nystagmus, otitis media, palpitation, parosmia, pharyngitis, photosensitivity reaction, pruritus, rash, restlessness, rhinitis, rigid neck, salivation increased, scotoma, shakiness, sinusitis, sneezing, stimulation, syncope, tachycardia, taste alterations, thirst, tinnitus, tremor, vasodilation, ventricular fibrillation, ventricular tachycardia, vertigo, vomiting, weakness

Metabolism/Transport Effects**Substrate** (minor) of CYP2D6, 3A4

Drug Interactions

Ergot Derivatives: May enhance the vasoconstricting effect of Serotonin 5-HT1D Receptor Agonists. Serotonin 5-HT1D Receptor Agonists may enhance the vasoconstricting effect of Ergot Derivatives. *Risk X: Avoid combination*

Ketoconazole: May increase the serum concentration of Almotriptan. *Risk C: Monitor therapy*

MAO Inhibitors: May decrease the metabolism of Serotonin 5-HT1D Receptor Agonists. Management: If MAO inhibitor therapy is required, naratriptan, eletriptan or frovatriptan may be a suitable 5-HT1D agonist to employ. *Risk X: Avoid combination*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

Nursing: Physical Assessment/MonitoringClear diagnosis of migraines and cardiac status should be determined before beginning treatment. Assess for use cautions (eg, risk factors for coronary artery disease; liver or renal dysfunction). Assess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (eg, ergot-containing drugs, SSRIs, MAO inhibitors). Assess effectiveness of therapy (relief of migraines) and adverse response (eg, hypertension or more serious cardiovascular symptoms). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationInform prescriber of all prescriptions (including oral contraceptives), OTC medications, or herbal products you are taking, and any allergies you have. This drug is to be used to reduce your migraine, not to prevent or reduce the number of attacks. Follow exact instructions for use. Do not use more than two doses in 24 hours and do not take within 24 hours of any other migraine medication without consulting prescriber. May cause dizziness, fatigue, or drowsiness (use caution when driving or engaging in tasks requiring alertness until response to drug is known). Report immediately any chest pain, palpitations, or throbbing; feelings of tightness or pressure in jaw or throat; acute headache or dizziness; muscle cramping, pain, or tremors; skin rash; hallucinations, anxiety, panic; or other adverse reactions. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as malate:

Axert™: 6.25 mg, 12.5 mg

Generic AvailableNo

ManufacturerPharmacia

Pricing: U.S. (www.drugstore.com)

Tablets (Axert)

6.25 mg (6): $125.20

12.5 mg (12): $229.97

Mechanism of ActionSelective agonist for serotonin (5-HT$_{1B}$, 5-HT$_{1D}$, 5-HT$_{1F}$ receptors) in cranial arteries; causes vasoconstriction and reduce sterile inflammation associated with antidromic neuronal transmission correlating with relief of migraine

Pharmacodynamics/Kinetics

Absorption: Well absorbed

Distribution: V_d: 180-200 L

Protein binding: ~35%

Metabolism: MAO type A oxidative deamination (~27% of dose); via CYP3A4 and 2D6 (~12% of dose) to inactive metabolites

Bioavailability: 70%

Half-life elimination: 3-4 hours

Time to peak: 1-3 hours

Excretion: Urine (40% as unchanged drug); feces (13% unchanged and metabolized)

Related Information

- Antimigraine Drugs: 5-HT1 Receptor Agonists

Dental Health: Effects on Dental TreatmentKey adverse effect(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Cardiovascular ConsiderationsCoronary vasospasm has been associated with 5-HT$_{1B/1D}$ agonists. These agents are contraindicated in patients with documented ischemic or vasospastic coronary artery disease. Patients with risk factors for CAD may receive these agents, provided a cardiovascular evaluation yields satisfactory evidence that the patient is free of cardiovascular disease. In patients with risk factors for CAD, administration of the initial dose in a medically staffed/equipped facility (ie, physician's office) is recommended. In addition, ECG monitoring after the initial dose should be considered. Patients who acquire risk factors for CAD, or long-term users of agents from this class of medications, should undergo periodic cardiovascular evaluation.

Anesthesia and Critical Care Concerns/Other ConsiderationsAlmotriptan should not be used in patients with a history of vasospastic disease, Prinzmetal's angina, or any critical vascular disease.

Index TermsAlmotriptan Malate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Lotronex® may be confused with Lovenox®, Protonix®

International issues:

Lotronex® may be confused with Lotanax® which is a brand name for terfenadine in the Czech Republic

Pronunciation(a LOE se tron)

U.S. Brand NamesLotronex®

Pharmacologic CategorySelective 5-HT_3 Receptor Antagonist

Use: Labeled IndicationsTreatment of women with severe diarrhea-predominant irritable bowel syndrome (IBS) who have failed to respond to conventional therapy

Dosing: AdultsIBS: Female: Oral: Initial: 0.5 mg twice daily for 4 weeks, with or without food; if tolerated, but response is inadequate, may be increased after 4 weeks to 1 mg twice daily. If response is inadequate after 4 weeks of 1 mg twice-daily dosing, discontinue treatment.

Note: Discontinue immediately if constipation or signs/symptoms of ischemic colitis occur. Do not reinitiate in patients who develop ischemic colitis.

Dosing: ElderlyRefer to adult dosing. Dosage adjustment is not required; however, postmarketing experience suggests that elderly patients may be at greater risk for complications of constipation.

Dosing: Renal ImpairmentThe need for dosage adjustment has not been defined (due to limited information on activity of metabolites).

Dosing: Hepatic ImpairmentIn mild-to-moderate dysfunction (Child-Pugh score ≤9), use caution. Contraindicated in severe hepatic dysfunction (Child-Pugh score ≥10).

Administration: OralMay be administered with or without food; however, when administered with food, absorption may be reduced by approximately 25%.

Dietary ConsiderationsMay be taken with or without food.

StorageStore at controlled room temperature of 25°C (77°F).

RestrictionsOnly physicians enrolled in Prometheus' Prescribing Program for Lotronex® may prescribe this medication. Program stickers must be affixed to all prescriptions; no phone, fax, or computerized prescriptions are permitted with this program.

An FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsDo not start treatment in patients who are constipated. Hypersensitivity to alosetron or any component of the formulation; history of severe or chronic constipation or sequelae from constipation; history of ischemic colitis, intestinal obstruction, stricture, toxic megacolon, gastrointestinal perforation and/or adhesions; diverticulitis, current or history of Crohn's disease, or ulcerative colitis; severe hepatic impairment; history of impaired intestinal circulation, thrombophlebitis, or hypercoagulable state; patients unable to understand or comply with "Patient-Physician" agreement; concomitant administration with fluvoxamine

Allergy Considerations

- Serotonin 5-HT_3 Antagonist Allergy

Warnings/Precautions

Boxed warnings:

- Appropriate use: See "Other warnings/precautions" below.
- Constipation: See "Concerns related to adverse effects" below.
- Ischemic colitis: See "Concerns related to adverse effects" below.
- Patient-Physician agreement: See "Other warnings/precautions" below.

Concerns related to adverse effects:

- Constipation: **[U.S. Boxed Warning]: Discontinue immediately in patients who develop constipation; serious complications of constipation have been infrequently reported (obstruction, ileus, perforation, impaction, toxic megacolon, secondary ischemia).** Constipation is a frequent, dose-related side effect; risk for complications from constipation may be increased in elderly, debilitated patients, or with concurrent use of other medications which decrease GI motility. Nonsevere constipation may be managed by temporarily interrupting therapy. Do not initiate in patients with constipation. Do not initiate in patients with constipation.

- Ischemic colitis: **[U.S. Boxed Warning]: Acute ischemic colitis has been reported during treatment.** Discontinue and evaluate immediately in patients who experience rectal bleeding or a sudden worsening of abdominal pain, and do not restart therapy if ischemic colitis is diagnosed.

Disease-related concerns:

- Hepatic impairment: Use caution in mild-to-moderate hepatic impairment (Child-Pugh score ≤9); contraindicated in severe impairment (Child-Pugh score ≥10).

Special populations:

- Elderly: Use with caution in the elderly due to increased risk of complications from constipation.

- Males: Safety and efficacy have not been established in males.

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: **[U.S. Boxed Warning]: Only indicated for women with severe diarrhea-predominant irritable bowel syndrome with inadequate response to conventional therapy.**

- Patient-Physician agreement: **[U.S. Boxed Warning]: Should only be prescribed by physicians enrolled in the Prometheus' Prescribing Program for Lotronex®. Patients must read and sign a "Patient-Physician" agreement before receiving the initial prescription.**

Geriatric ConsiderationsPostmarketing experience suggests that elderly patients may be at greater risk for complications of constipation.
Pregnancy Risk FactorB
Pregnancy ConsiderationsThere are no adequate and well-controlled studies in pregnant women. Alosetron should be used in pregnant women only if clearly needed.
LactationExcretion in breast milk unknown/use caution
Breast-Feeding ConsiderationsAnimal studies indicate that alosetron and/or metabolites are excreted in breast milk. It is not known if alosetron in excreted in human milk. Caution should be used in administering alosetron to a nursing woman.
Adverse Reactions

>10%: Gastrointestinal: Constipation (dose related; 29%)

2% to 10%: Gastrointestinal: Abdominal discomfort and pain (7%), nausea (6%), gastrointestinal discomfort and pain (5%), abdominal distention (2%), hemorrhoids (2%), regurgitation and reflux (2%)

≤1% (Limited to important or life-threatening): Allergic skin reactions, alopecia, anxiety, arrhythmia, bilirubin level changes, bladder inflammation, bone pain, breathing disorder, cholecystitis, cognitive function disorders, confusion, cramps, colitis, depression, dermatitis, diaphoresis, diverticulitis, dyspepsia, extrasystoles, fatigue, fluid disturbances, gastroenteritis, GI intussusception, GI lesions, GI motility decreased, GI obstructions, GI spasms, hematoma, hemorrhage, hyperacidity, hyper-/hypoglycemia, hypertension, hypnagogic effects, hypoesthesia, hypothalamus/pituitary dysfunction, ileus, ischemic colitis, memory effects, muscle pain/stiffness, occult stools, pain, proctitis, RBC/hemoglobin defects, sedation, sexual dysfunction, skeletal pain, tachyarrhythmia, temperature regulation impairment, tremor, ulcerative colitis, urinary frequency, urticaria

Postmarketing and/or case reports: GI impaction, GI perforation, GI ulceration, headache, hepatitis, rash, small bowel mesenteric ischemia

Metabolism/Transport Effects**Substrate** of CYP1A2 (major), 2C9 (minor), 3A4 (minor); **Inhibits** CYP1A2 (weak), 2E1 (weak)
Drug Interactions

Apomorphine: Antiemetics (5HT3 Antagonists) may enhance the hypotensive effect of Apomorphine. *Risk X: Avoid combination*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inhibitors (Strong): May increase the serum concentration of Alosetron. *Risk C: Monitor therapy*

Fluvoxamine: May decrease the metabolism of Alosetron. *Risk X: Avoid combination*

Rifamycin Derivatives: May increase the metabolism of Antiemetics (5HT3 Antagonists). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: When administered with food, absorption may be reduced by ~25%.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Lotrenex®: 0.5 mg, 1 mg

Generic AvailableNo
ManufacturerPrometheus Laboratories
Pricing: U.S. (www.drugstore.com)

Tablets (Lotronex)

0.5 mg (30): $375.96

1 mg (30): $428.32

Mechanism of ActionAlosetron is a potent and selective antagonist of a subtype of the serotonin 5-HT$_3$ receptor. 5-HT$_3$ receptors are ligand-gated ion channels extensively distributed on enteric neurons in the human gastrointestinal tract, as well as other peripheral and central locations. Activation of these channels affect the regulation of visceral pain, colonic transit, and gastrointestinal secretions. In patients with irritable bowel syndrome, blockade of these channels may reduce pain, abdominal discomfort, urgency, and diarrhea.

Pharmacodynamics/Kinetics

Distribution: V$_d$: 65-95 L

Protein binding: 82%

Metabolism: Extensive hepatic metabolism. Alosetron is metabolized by CYP2C9, 3A4, and 1A2. Thirteen metabolites have been detected in the urine. Biological activity of these metabolites in unknown.

Bioavailability: Mean: 50% to 60% (range: 30% to >90%); decreased with food (25%)

Half-life elimination: 1.5 hours for alosetron

Time to peak: 1 hour after oral administration

Excretion: Urine (73%) and feces (24%); 7% as unchanged drug (1% feces, 6% urine)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause depression or sleep abnormalities; may rarely cause anxiety or sedation

Mental Health: Effects on Psychiatric TreatmentConstipation is common; use caution with concurrent psychotropics possessing anticholinergic activity (eg, benztropine, clozapine, TCAs); may cause nausea; concurrent use with SSRIs, lithium, or valproate may produce additive effects

Alpha-Galactosidase

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(AL fa ga lak TOE si days)
U.S. Brand Namesbeano® [OTC]
Pharmacologic CategoryEnzyme
Use: Labeled IndicationsPrevention of flatulence and bloating attributed to a variety of grains, cereals, nuts, and vegetables containing the sugars raffinose, stachyose, and/or verbascose
Dosing: AdultsFlatulence and bloating: Oral:

Drops: Take 5 drops per serving of problem food; adjust according to number of problem foods per meal; usual dose/meal: 10-15 drops

Tablet: One tablet per serving of problem food; adjust according to number of problem foods per meal; usual dose/meal: 2-3 tablets

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric

Flatulence and bloating: Children ≥12 years: Refer to adult dosing.

Administration: Oral

Drops: Take with meal; do not cook

Tablet: Swallow, chew, or crumble. Take with meal; do not cook.

Dietary ConsiderationsBeano® must be taken just before or during a meal to be effective. Drops contain 5 mg of sodium per 5 drops. Although made from safe, food-grade mold, there is no evidence that individuals with an allergy to penicillin or molds would have an allergy to Beano®. Beano® contains less than 0.00016% (point of detection) of gluten. Galactosemics should consult their healthcare provider.
StorageStore at or below room temperature. Avoid heat.
ContraindicationsHypersensitivity to any component of the formulation
Warnings/Precautions

Special populations:

- Galactosemic patients: Patients who are galactosemic should consult their healthcare provider prior to use.
- Pediatrics: Use is not recommended for children <12 years of age.
- Pregnancy: Patients who are pregnant or breast-feeding should consult a healthcare provider.

Other warnings/precautions:

- Approved use: Currently, there are no FDA-approved disease-prevention or therapeutic indications for this product.
- Heat exposure: Heat can inactivate; do not cook.

Nursing: Physical Assessment/MonitoringTeach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.
Patient EducationUse exactly as directed on package insert. Take at beginning of meal. Do not cook.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Liquid, oral [drops]:

beano®: 150 galactosidase units/5 drops [contains sodium 5 mg/5 drops]

Tablet, oral:

beano®: 150 galactosidase units/tablet

Generic AvailableNo
ManufacturerGlaxoSmithKline
Mechanism of ActionNatural food enzyme that breaks down complex sugars in gassy foods, making them more digestible and less gassy.
Index Terms*Aspergillus niger*

$_1$-Proteinase Inhibitor'; return;">

Alpha$_1$-Proteinase Inhibitor

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Special Alerts

Aralast NP Product Availability

The Food and Drug Administration (FDA) has approved Aralast NP (alpha$_1$-proteinase inhibitor) for the treatment of congenital alpha$_1$-antitrypsin deficiency. Aralast NP has the same formulation as Aralast; the name reflects a product which is completely processed by Baxter. A launch date has not yet been announced, but Aralast NP is expected to be available as supplies of Aralast are depleted.

Pronunciation(al fa won PRO tee in ase in HI bi tor)
U.S. Brand NamesAralast; Aralast NP; Prolastin®; Zemaira®
Canadian Brand NamesProlastin®
Pharmacologic CategoryAntitrypsin Deficiency Agent
Use: Labeled IndicationsReplacement therapy in congenital alpha$_1$-antitrypsin deficiency with clinical emphysema
Dosing: AdultsAlpha$_1$-antitrypsin deficiency: I.V.: 60 mg/kg once weekly
Dosing: ElderlyRefer to adult dosing.
Administration: I.V.For I.V. infusion only; reduce rate or temporarily discontinue infusion if adverse effects occur. Infuse at ~0.08 mL/kg/minute; actual rate may be increased or decreased based on patient response. Emergency equipment (including epinephrine) should be available during infusion. Do not mix with other agents or solutions.
Dietary ConsiderationsSodium content of 1 L after reconstitution:

Aralast, Aralast NP: ≤230 mEq/L

Prolastin®: 100-210 mEq/L

Zemaira®: 81 mEq/1000 mg

Storage

Aralast, Aralast NP: Store under refrigeration at 2°C to 8°C (35°F to 46°F). Do not freeze. May also be stored at room temperature 25°C (77°F) for up to 1 month.

Prolastin®: Store up to ≤25°C (≤77°F); avoid freezing.

Zemaira™: Store up to 25°C (77°F). Avoid freezing.

ReconstitutionReconstitute with SWFI. To mix, swirl; do not shake. Use within 3 hours of reconstitution.
ContraindicationsHypersensitivity to any component of the formulation or other A$_1$-PI products; selective IgA deficiency with known anti-IgA antibody
Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Hypersensitivity and anaphylactic reactions can occur; immediate treatment (including epinephrine 1:1000) should be available. Severe anaphylaxis may occur in patients with anti-IgA antibody; use in patients with selective IgA deficiency with known anti-IgA antibody is contraindicated

Disease-related concerns:

- Fluid overload: Use with caution in patients at risk for fluid overload.

- Hepatitis B: May consider hepatitis B immunization.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Human plasma: Product of human plasma; may potentially contain infectious agents which could transmit disease. Screening of donors, as well as testing and/or inactivation or removal of certain viruses, reduces the risk. Infections thought to be transmitted by this product should be reported to the manufacturer.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

>10%: Hepatic: ALT increased (11%; ~4 times ULN), AST increased (11%; ~4 times ULN)

1% to 10%:

Central nervous system: Headache (≤7%)

Neuromuscular & skeletal: Musculoskeletal discomfort (7%)

Respiratory: Pharyngitis (2%)

<1%, postmarketing, and/or case reports: Allergic reactions, asthma, back pain, bilateral pulmonary infiltrates, bloating, bronchitis, chest pain, chills, cough increased, dizziness, dyspnea, fever <102°F (delayed up to 12 hours after treatment), flu-like syndrome, hypotension, leukocytosis, lightheadedness, pain, peripheral edema, pruritus, rash, rhinitis, sinusitis, somnolence, tachycardia, vasodilation, viral infection, vision abnormal. Severe reactions (anaphylaxis) may occur in patients with anti-IgA antibody.

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersAlpha$_1$-PI serum levels; lung function; vital signs during infusion
Monitoring: Lab TestsAlpha$_1$-PI serum levels
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]:

Aralast, Aralast NP: 500 mg, 1000 mg [contains sodium ≤230 MEq/L and polysorbate 80; packaged with diluent]

Prolastin®: 500 mg, 1000 mg [contains sodium 100-210 mEq/L and sucrose; packaged with diluent]

Zemaira®: 1000 mg [contains sodium 81 mEq/1000 mg; packaged with diluent]

Generic AvailableNo
Mechanism of ActionAlpha$_1$-antitrypsin (AAT) is the principle protease inhibitor in serum. Its major physiologic role is to render proteolytic enzymes (secreted during inflammation) inactive. A decrease in AAT, as seen in congenital AAT deficiency, leads to increased elastic damage in the lung, causing emphysema.
Pharmacodynamics/Kinetics

Distribution: V_d: ~3.5 L

Half-life elimination: Metabolic: 5.9 days (Aralast)

Time to peak, serum: ~1 hour; threshold levels achieved after 3 weeks

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Pharyngitis
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsA$_1$-PI; Alpha$_1$-Antitrypsin; Alpha$_1$-PI; Alpha$_1$-Proteinase Inhibitor, Human; α_1-PI

International Brand NamesProlastin (CA)

ALPRAZolam

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

ALPRAZolam may be confused with alprostadil, LORazepam, triazolam

Xanax® may be confused with Lanoxin®, Tenex®, Tylox®, Xopenex®, Zantac®, Zyrtec®

Pronunciation(al PRAY zoe lam)

U.S. Brand NamesAlprazolam Intensol®; Niravam™; Xanax XR®; Xanax®

Canadian Brand NamesAlti-Alprazolam; Apo-Alpraz®; Apo-Alpraz® TS; Gen-Alprazolam; Novo-Alprazol; Nu-Alprax; Xanax TS™; Xanax®

Pharmacologic CategoryBenzodiazepine

Use: Labeled IndicationsTreatment of anxiety disorder (GAD); panic disorder, with or without agoraphobia; anxiety associated with depression

Use: Unlabeled/InvestigationalAnxiety in children

Use: DentalPreoperative sedation

Dosing: Adults**Note:** Treatment >4 months should be re-evaluated to determine the patient's continued need for the drug

Anxiety: Oral: *Immediate release:* Effective doses are 0.5-4 mg/day in divided doses; the manufacturer recommends starting at 0.25-0.5 mg 3 times/day; titrate dose upward; usual maximum: 4 mg/day. Patients requiring doses >4 mg/day should be increased cautiously. Periodic reassessment and consideration of dosage reduction is recommended.

Anxiety associated with depression: Oral: *Immediate release:* Average dose required: 2.5-3 mg/day in divided doses

Ethanol withdrawal (unlabeled use): Oral: *Immediate release:* Usual dose: 2-2.5 mg/day in divided doses

Panic disorder: Oral:

Immediate release: Initial: 0.5 mg 3 times/day; dose may be increased every 3-4 days in increments ≤1 mg/day. Mean effective dosage: 5-6 mg/day; many patients obtain relief at 2 mg/day, as much as 10 mg/day may be required

Extended release: 0.5-1 mg once daily; may increase dose every 3-4 days in increments ≤1 mg/day (range: 3-6 mg/day)

Switching from immediate release to extended release: Patients may be switched to extended release tablets by taking the total daily dose of the immediate release tablets and giving it once daily using the extended release preparation.

Preoperative sedation: Oral: 0.5 mg in evening at bedtime and 0.5 mg 1 hour before procedure

Dose reduction: Abrupt discontinuation should be avoided. Daily dose may be decreased by 0.5 mg every 3 days, however, some patients may require a slower reduction. If withdrawal symptoms occur, resume previous dose and discontinue on a less rapid schedule.

Dosing: ElderlyInitial: 0.125-0.25 mg twice daily; increase by 0.125 mg/day as needed. The smallest effective dose should be used.

Immediate release: Initial 0.25 mg 2-3 times/day

Extended release: Initial: 0.5 mg once daily

Dosing: Pediatric

Anxiety (unlabeled use): Oral: Immediate release: Initial: 0.005 mg/kg/dose or 0.125 mg/dose 3 times/day; increase in increments of 0.125-0.25 mg, up to a maximum of 0.02 mg/kg/dose or 0.06 mg/kg/day (0.375-3 mg/day). See "Dose Reduction" comment in adult dosing.

Note: Treatment >4 months should be re-evaluated to determine the patient's continued need for the drug.

Dosing: Renal ImpairmentNo guidelines for adjustment; use caution.

Dosing: Hepatic ImpairmentOral: Reduce dose by 50% to 60% or avoid in cirrhosis.

Administration: Oral

Immediate release preparations: Can be administered sublingually with comparable onset and completeness of absorption.

Extended release tablet: Should be taken once daily in the morning; do not crush, break, or chew.

Orally-disintegrating tablets: Using dry hands, place tablet on top of tongue. If using one-half of tablet, immediately discard remaining half (may not remain stable). Administration with water is not necessary.

StorageOrally-disintegrating tablet: Store at room temperature of 20°C to 25°C (68°F to 77°F). Protect from moisture. Seal bottle tightly and discard any cotton packaged inside bottle.

RestrictionsC-IV

ContraindicationsHypersensitivity to alprazolam or any component of the formulation (cross-sensitivity with other benzodiazepines may exist); narrow-angle glaucoma; concurrent use with ketoconazole or itraconazole; pregnancy

Allergy Considerations

- Benzodiazepine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anterograde amnesia: Benzodiazepines have been associated with anterograde amnesia.
- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Paradoxical reactions: Paradoxical reactions, including hyperactive or aggressive behavior, have been reported with benzodiazepines, particularly in adolescent/pediatric or psychiatric patients.

Disease-related concerns:

- Depression: Use caution in patients with depression, particularly if suicidal risk may be present; episodes of mania or hypomania have occurred in depressed patients treated with alprazolam.
- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use (generally >10 days).
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Impaired gag reflux: Use with caution in patients with an impaired gag reflux.
- Renal impairment: Use with caution in patients with renal impairment or predisposition to urate nephropathy; has weak uricosuric properties.
- Respiratory disease: Use with caution in patients with respiratory disease.

Concurrent drug therapy issues:

- CNS depressants/psychoactive medications: Use with caution in patients receiving other CNS depressants or psychoactive medication; effects with other sedative drugs or ethanol may be potentiated.
- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors, moderate or strong CYP3A4 inducers and major CYP3A4 substrates (see Drug Interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.

Special populations:

- Debilitated patients: Use with caution in debilitated patients.
- Elderly: Use with caution in the elderly; benzodiazepines have been associated with falls and traumatic injury.
- Fall risk: Use with extreme caution in patients who are at risk of falls; benzodiazepines have been associated with falls and traumatic injury.
- Obese patients: Use with caution in obese patients; may have prolonged action when discontinued.

Other warnings/precautions:

- Appropriate use: Does not have analgesic, antidepressant, or antipsychotic properties.
- Breakthrough anxiety: At the end of dosing interval, breakthrough anxiety may occur.
- Withdrawal: Rebound or withdrawal symptoms, including seizures, may occur 18 hours to 3 days following abrupt discontinuation or large decreases in dose (more common in patients receiving >4 mg/day or prolonged treatment). Use caution when reducing dose or withdrawing therapy; decrease slowly and monitor for withdrawal symptoms. Flumazenil may cause withdrawal in patients receiving long-term benzodiazepine therapy.

Geriatric ConsiderationsConsidered to be a benzodiazepine of choice in elderly due to the short duration of action.

Pregnancy Risk FactorD

Pregnancy ConsiderationsBenzodiazepines have the potential to cause harm to the fetus, particularly when administered during the first trimester. In addition, withdrawal symptoms may occur in the neonate following *in utero* exposure. Use during pregnancy should be avoided.

LactationEnters breast milk/not recommended (AAP rates “of concern”)

Breast-Feeding ConsiderationsSymptoms of withdrawal, lethargy, and loss of body weight have been reported in infants exposed to alprazolam and/or benzodiazepines while nursing. Breast-feeding is not recommended.

Adverse Reactions

>10%:

Central nervous system: Abnormal coordination, cognitive disorder, depression, drowsiness, fatigue, irritability, lightheadedness, memory impairment, sedation, somnolence

Gastrointestinal: Appetite increased/decreased, constipation, salivation decreased, weight gain/loss, xerostomia

Genitourinary: Micturition difficulty

Neuromuscular & skeletal: Dysarthria

1% to 10%:

Cardiovascular: Hypotension

Central nervous system: Agitation, attention disturbance, confusion, depersonalization, derealization, disorientation, disinhibition, dizziness, dream abnormalities, fear, hallucinations, hypersomnia, nightmares, seizure, talkativeness

Dermatologic: Dermatitis, pruritus, rash

Endocrine & metabolic: Libido decreased/increased, menstrual disorders

Gastrointestinal: Salivation increased

Genitourinary: Incontinence

Hepatic: Bilirubin increased, jaundice, liver enzymes increased

Neuromuscular & skeletal: Arthralgia, ataxia, myalgia, paresthesia

Ocular: Diplopia

Respiratory: Allergic rhinitis, dyspnea

<1% (Limited to important or life-threatening): Amnesia, falls

Postmarketing and/or case reports: Galactorrhea, gynecomastia, hepatic failure, hepatitis, hyperprolactinemia, Stevens-Johnson syndrome

Metabolism/Transport Effects **Substrate** of CYP3A4 (major)

Drug Interactions

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Aprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Clozapine: Benzodiazepines may enhance the adverse/toxic effect of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Disulfiram: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Fosaprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). Specifically, the active metabolite aprepitant is likely responsible for this effect. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Isoniazid: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Nefazodone: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Oral Contraceptive (Progestins): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). Management: Amprenavir, atazanavir, darunavir, indinavir, nelfinavir, ritonavir, and tipranavir are contraindicated with midazolam and triazolam according to each protease inhibitor's prescribing information. *Risk D: Consider therapy modification*

Proton Pump Inhibitors: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). **Exceptions:** Lansoprazole; Pantoprazole; Rabeprazole. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Citalopram; Escitalopram; PARoxetine; Sertraline. *Risk C: Monitor therapy*

St Johns Wort: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Theophylline Derivatives: May diminish the therapeutic effect of Benzodiazepines. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb Interactions

Cigarette smoking: May decrease alprazolam concentrations up to 50%.

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Alprazolam serum concentration is unlikely to be increased by grapefruit juice because of alprazolam's high oral bioavailability. The C_{max} of the extended release formulation is increased by 25% when a high-fat meal is given 2 hours before dosing. T_{max} is decreased 30% when food is given immediately prior to dose. T_{max} is increased by 30% when food is given ≥1 hour after dose.

Herb/Nutraceutical: St John's wort may decrease alprazolam levels. Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Monitoring Parameters Respiratory and cardiovascular status

Nursing: Physical Assessment/Monitoring Assess other medications patient may be taking for effectiveness and interactions. Assess for signs of CNS depression. Assess for history of addiction; long-term use can result in dependence, abuse, or tolerance; periodically evaluate need for continued use. For inpatient use, institute safety measures and monitor effectiveness and adverse reactions. For outpatients, monitor therapeutic effectiveness and adverse reactions at beginning of therapy and periodically with long-term use. Taper dosage slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient Education Take exactly as directed; do not increase dose or frequency. Drug may cause physical and/or psychological dependence. Avoid alcohol and do not take other prescription or OTC medications (especially pain medications, sedatives, antihistamines, or hypnotics) without consulting prescriber. Do not stop medication or reduce dosage abruptly without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience drowsiness, lightheadedness, impaired coordination, dizziness, or blurred vision (use caution when driving or engaging in hazardous tasks until response to drug is known); nausea, vomiting, or dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, and fiber may help); altered sexual drive or ability (reversible); or photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight). Report persistent CNS effects (eg, confusion, depression, increased sedation, excitation, headache, agitation, insomnia or nightmares, dizziness, fatigue, impaired coordination, changes in personality, or changes in cognition); changes in urinary pattern; muscle cramping, weakness, tremors, or rigidity; ringing in ears or visual disturbances; chest pain, palpitations, or rapid heartbeat; excessive perspiration; excessive GI symptoms (eg, cramping, constipation, vomiting, anorexia); or worsening of condition. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication; use appropriate contraceptive measures as recommended by your prescriber. Breast-feeding is not recommended.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, oral [concentrate]:

Alprazolam Intensol®: 1 mg/mL (30 mL) [alcohol free, dye free, sugar free; contains propylene glycol]

Tablet: 0.25 mg, 0.5 mg, 1 mg, 2 mg

Xanax®: 0.25 mg, 0.5 mg, 1 mg, 2 mg

Tablet, extended release: 0.5 mg, 1 mg, 2 mg, 3 mg

Xanax XR®: 0.5 mg, 1 mg, 2 mg, 3 mg

Tablet, orally disintegrating [scored]:

Niravam™: 0.25 mg, 0.5 mg, 1 mg, 2 mg [orange flavor]

Generic Available Yes: Extended release tablet, immediate release tablet

Pricing: U.S. (www.drugstore.com)

Concentrate (Alprazolam Intensol)

1 mg/mL (30): $65.08

Tablet, 24-hour (Alprazolam)

0.5 mg (30): $31.99

1 mg (30): $69.99

2 mg (30): $76.00

Tablet, 24-hour (Xanax XR)

0.5 mg (30): $77.69

1 mg (30): $99.11

2 mg (30): $128.72

3 mg (30): $193.07

Tablet, orally-disintegrating (Niravam)

0.25 mg (30): $39.30

0.5 mg (30): $48.38

1 mg (30): $59.51

2 mg (30): $100.79

Tablets (Alprazolam)

0.25 mg (30): $11.99

0.5 mg (30): $11.99

1 mg (30): $11.99

2 mg (30): $13.99

Tablets (Xanax)

0.25 mg (30): $44.09

0.5 mg (30): $51.44

1 mg (30): $65.09

2 mg (30): $105.99

Mechanism of ActionBinds to stereospecific benzodiazepine receptors on the postsynaptic GABA neuron at several sites within the central nervous system, including the limbic system, reticular formation. Enhancement of the inhibitory effect of GABA on neuronal excitability results by increased neuronal membrane permeability to chloride ions. This shift in chloride ions results in hyperpolarization (a less excitable state) and stabilization.

Pharmacodynamics/Kinetics

Onset of action: Immediate release and extended release formulations: 1 hour

Duration of action: Immediate release: 5.1 ± 1.7 hours; Extended release: 11.3 ± 4.2 hours

Absorption: Extended release: Slower relative to immediate release formulation resulting in a concentration that is maintained 5-11 hours after dosing

Distribution: V_d: 0.9-1.2 L/kg; enters breast milk

Protein binding: 80%; primarily to albumin

Metabolism: Hepatic via CYP3A4; forms two active metabolites (4-hydroxyalprazolam and α-hydroxyalprazolam)

Bioavailability: 90%

Half-life elimination:

Adults: 11.2 hours (immediate release range: 6.3-26.9; extended release range: 10.7-15.8)

Elderly: 16.3 hours (range: 9-26.9 hours)

Alcoholic liver disease: 19.7 hours (range: 5.8-65.3 hours)

Obesity: 21.8 hours (range: 9.9-40.4 hours)

Time to peak, serum: Immediate release: 1-2 hours; Extended release: ~9 hours; decreased by 1 hour following bedtime dosing compared to morning dosing

Excretion: Urine (as unchanged drug and metabolites)

Pharmacotherapy PearlsNot intended for management of anxieties and minor distresses associated with everyday life. Treatment longer than 4 months should be re-evaluated to determine the patient's need for the drug. Patients who become physically dependent on alprazolam tend to have a difficult time discontinuing it; withdrawal symptoms may be severe. To minimize withdrawal symptoms, taper dosage slowly; do not discontinue abruptly. Abrupt discontinuation after sustained use (generally >10 days) may cause withdrawal symptoms.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Significant xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Child/Adolescent ConsiderationsChildren <18 years: Anxiety: Dose not established; investigationally, in children 7-16 years of age (n=13), initial doses of 0.005 mg/kg or 0.125 mg/dose were given 3 times/day for situational anxiety; increments of 0.125-0.25 mg were used to increase doses to maximum of 0.02 mg/kg/dose or 0.06 mg/kg/day; a range of 0.375-3 mg/day was needed.

Note: A more recent study in 17 children (8-17 years of age) with overanxious disorder or avoidant disorders used initial daily doses of 0.25 mg for children <40 kg and 0.5 mg for those >40 kg. The dose was titrated at 2-day intervals to a maximum of 0.04 mg/kg/day. Required doses ranged from 0.5-3.5 mg/day (mean: 1.6 mg/day). Based on clinical global ratings, alprazolam appeared to be better than placebo, however, this difference was **not** statistically significant; further studies are needed (Simeon, 1992).

Simeon JG, Ferguson HB, Knott V, et al, “Clinical, Cognitive, and Neurophysiological Effects of Alprazolam in Children and Adolescents With Overanxious and Avoidant Disorders,” *J Am Acad Child Adolesc Psychiatry*, 1992, 31(1):29-33.

Mental Health CommentIn 2007, the FDA requested that all manufacturers of sedative-hypnotic drug products revise labeling to include a greater emphasis on the risks of adverse effects. These risks include severe allergic reactions (anaphylaxis, angioedema) and complex sleep-related behaviors, which may include sleep-driving (driving while not fully awake and with no memory of the event), making phone calls, and preparing and eating food while asleep.

There are two subtypes of GABA receptors (GABA-A and GABA-B) and three different benzodiazepine receptors (Bz_1, Bz_2, and Bz_3). Benzodiazepine receptors and effects appear to be linked to the GABA-A receptors. Benzodiazepines do not bind to GABA-B receptors. The role of GABA-B receptors is unclear. Benzodiazepines have no specificity for benzodiazepine receptor subtypes.

Alprazolam is a short half-life benzodiazepine. Duration of action after a single dose is determined by redistribution rather than metabolism. Tolerance develops to the sedative, hypnotic, and anticonvulsant effects. It does not develop to the anxiolytic or skeletal muscle-relaxing effects. Psychological and physical dependence may occur with prolonged use of benzodiazepines. The onset of withdrawal symptoms is usually seen on the first day without drug and lasts 5-7 days in patients receiving short half-life benzodiazepines, whereas, the onset occurs after 5 days with a duration of 10-14 days after abrupt discontinuance of long half-life benzodiazepines. Risk factors for abuse include personal or family history of substance abuse and personality disorder.

With the exception of a slower absorption rate, the extended release dosage form of alprazolam displays similar bioavailability and pharmacokinetics to the immediate release dosage form. The slower absorption rate results in a concentration that is maintained between 5-11 hours after dosing. The rate of absorption of benzodiazepines has been linked to abuse potential and side effect burden (sedation and cognitive impairment). The extended release dosage form may have less abuse potential and side effects relative to the immediate release dosage form.

Anesthesia and Critical Care Concerns/Other ConsiderationsChronic use of this agent may increase the perioperative benzodiazepine dose needed to achieve desired effect. Patients who become physically dependent on alprazolam tend to have a difficult time discontinuing it; withdrawal symptoms may be severe. To minimize withdrawal symptoms, taper dosage slowly; do not discontinue abruptly. Abrupt discontinuation after sustained use (generally >10 days) may cause withdrawal symptoms.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Alprostadil may be confused with alPRAZolam

Pronunciation(al PROS ta dill)

U.S. Brand NamesCaverject Impulse®; Caverject®; Edex®; Muse®; Prostin VR Pediatric®

Canadian Brand NamesCaverject®; Muse® Pellet; Prostin® VR

Pharmacologic CategoryProstaglandin; Vasodilator

Use: Labeled Indications

Prostin VR Pediatric®: Temporary maintenance of patency of ductus arteriosus in neonates with ductal-dependent congenital heart disease until surgery can be performed. These defects include cyanotic (eg, pulmonary atresia, pulmonary stenosis, tricuspid atresia, Fallot's tetralogy, transposition of the great vessels) and acyanotic (eg, interruption of aortic arch, coarctation of aorta, hypoplastic left ventricle) heart disease.

Caverject®: Treatment of erectile dysfunction of vasculogenic, psychogenic, or neurogenic etiology; adjunct in the diagnosis of erectile dysfunction

Edex®, Muse®: Treatment of erectile dysfunction of vasculogenic, psychogenic, or neurogenic etiology

Use: Unlabeled/InvestigationalInvestigational: Treatment of pulmonary hypertension in infants and children with congenital heart defects with left-to-right shunts

Dosing: Adults

Erectile dysfunction:

Intracavernous (Caverject®, Edex®): Individualize dose by careful titration; doses >40 mcg (Edex®) or >60 mcg (Caverject®) are not recommended: Initial dose must be titrated in physician's office. Patient must stay in the physician's office until complete detumescence occurs; if there is no response, then the next higher dose may be given within 1 hour; if there is still no response, a 1-day interval before giving the next dose is recommended; increasing the dose or concentration in the treatment of impotence results in increasing pain and discomfort.

Vasculogenic, psychogenic, or mixed etiology: Initiate dosage titration at 2.5 mcg, increasing by 2.5 mcg to a dose of 5 mcg and then in increments of 5-10 mcg depending on the erectile response until the dose produces an erection suitable for intercourse, not lasting >1 hour; if there is absolutely no response to initial 2.5 mcg dose, the second dose may be increased to 7.5 mcg, followed by increments of 5-10 mcg

Neurogenic etiology (eg, spinal cord injury): Initiate dosage titration at 1.25 mcg, increasing to a dose of 2.5 mcg and then 5 mcg; increase further in increments 5 mcg until the dose is reached that produces an erection suitable for intercourse, not lasting >1 hour

Maintenance: Once appropriate dose has been determined, patient may self-administer injections at a frequency of no more than 3 times/week with at least 24 hours between doses

Intraurethral (Muse® Pellet):

Initial: 125-250 mcg

Maintenance: Administer as needed to achieve an erection; duration of action is about 30-60 minutes; use only two systems per 24-hour period

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Patent ductus arteriosus I.V.:

Prostin VR Pediatric®: I.V. continuous infusion into a large vein, or alternatively through an umbilical artery catheter placed at the ductal opening: 0.05-0.1 mcg/kg/minute with therapeutic response, rate is reduced to lowest effective dosage. With unsatisfactory response, rate is increased gradually; maintenance: 0.01-0.4 mcg/kg/minute.

Note: PGE_1 is usually given at an infusion rate of 0.1 mcg/kg/minute, but it is often possible to reduce the dosage to $^1/_2$ or even $^1/_{10}$ without losing the therapeutic effect. The mixing schedule is shown in the table.

Alprostadil

Add 1 Ampul (500 mcg) to:	Concentration (mcg/mL)	Infusion Rate	
		mL/min/kg Needed to Infuse 0.1 mcg/kg/min	mL/kg/24 h
250 mL	2	0.05	72
100 mL	5	0.02	28.8
50 mL	10	0.01	14.4
25 mL	20	0.005	7.2

Note: Therapeutic response is indicated by increased pH in those with acidosis or by an increase in oxygenation (PO_2) usually evident within 30 minutes.

Administration: OtherErectile dysfunction: Use a $^1/_2$ inch, 27- to 30-gauge needle. Inject into the dorsolateral aspect of the proximal third of the penis, avoiding visible veins; alternate side of the penis for injections.

Storage

Caverject® Impulse™: Store at controlled room temperature of 15°C to 30°C (59°F to 86°F). Following reconstitution, use within 24 hours and discard any unused solution.

Caverject® powder: The 5 mcg, 10 mcg, and 20 mcg vials should be stored at or below 25°C (77°F); The 40 mcg vial should be stored at 2°C to 8°C until dispensed. After dispensing, stable for up to 3 months at or below 25°C. Following reconstitution, all strengths should be stored at or below 25°C (77°F); do not refrigerate or freeze; use within 24 hours.

Caverject® solution: Prior to dispensing, store frozen at -20°C to -10°C (-4°F to -14°F). Once dispensed, may be stored frozen for up to 3 months, or under refrigeration at 2°C to 8°C (36°F to 46°F) for up to 7 days. Do not refreeze. Once removed from foil wrap, solution may be allowed to warm to room temperature prior to use. If not used immediately, solution should be discarded. Shake well prior to use.

Edex®: Store at controlled room temperature of 15°C to 30°C (59°F to 86°F); following reconstitution, use immediately and discard any unused solution.

Muse®: Refrigerate at 2°C to 8°C (36°F to 46°F); may be stored at room temperature for up to 14 days

Prostin VR Pediatric®: Refrigerate at 2°C to 8°C (36°F to 46°F). Prior to infusion, dilute with D_5W or NS; use within 24 hours.

Reconstitution

Caverject® Impulse™: Provided as a dual-chamber syringe with diluent in one chamber. To mix, hold syringe with needle pointing upward and turn plunger clockwise; turn upside down several times to mix. Device can be set to deliver specified dose, each device can be set at various increments.

Caverject® powder: Use only the supplied diluent for reconstitution (ie, bacteriostatic/sterile water with benzyl alcohol 0.945%).

Edex®: Reconstitute with NS.

ContraindicationsHypersensitivity to alprostadil or any component of the formulation; hyaline membrane disease or persistent fetal circulation and when a dominant left-to-right shunt is present; respiratory distress syndrome; conditions predisposing patients to priapism (sickle cell anemia, multiple myeloma, leukemia); patients with anatomical deformation of the penis, penile implants; use in men for whom sexual activity is inadvisable or contraindicated; pregnancy

Warnings/Precautions

Boxed warnings:

- Apnea: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Apnea: **[U.S. Boxed Warning]: Apnea may occur in 10% to 12% of neonates with congenital heart defects, especially in those weighing <2 kg at birth.** Apnea usually appears during the first hour of drug infusion.

Disease-related concerns:

- Erectile dysfunction: Appropriate use: When used in erectile dysfunction, priapism may occur; patient must be instructed to report to physician or seek immediate medical assistance if an erection persists for longer than 4 hours. Treat immediately to avoid penile tissue damage and permanent loss of potency; discontinue therapy if signs of penile fibrosis develop (penile angulation, cavernosal fibrosis, or Peyronie's disease).

- Patency of ductus arteriosus: Appropriate use: Infuse for the shortest time at the lowest dose consistent with good patient care. Use for

>120 hours has been associated with antral hyperplasia and gastric outlet obstruction.

Special populations:

- Neonates: Use with caution in neonates with bleeding tendencies.

Dosage form specific issues:

- Muse®: When used in erectile dysfunction, syncope occurring within 1 hour of administration has been reported. The potential for drug-drug interactions may occur when prescribed concomitantly with antihypertensives. Some lowering of blood pressure may occur without symptoms, and swelling of leg veins, leg pain, perineal pain, and rapid pulse have been reported in <2% of patients during in-clinic titration and home treatment.

Geriatric ConsiderationsElderly may have concomitant diseases which would contraindicate the use of alprostadil. Other forms of attaining penile tumescence are recommended.
Pregnancy Risk FactorX/C (Muse®)
Pregnancy ConsiderationsAlprostadil is embryotoxic in animal studies. It is not indicated for use in women. The manufacturer of Muse® recommends a condom barrier when being used during sexual intercourse with a pregnant women.
LactationNot indicated for use in women
Adverse Reactions

Intraurethral:

>10%: Genitourinary: Penile pain, urethral burning

2% to 10%:

Central nervous system: Headache, dizziness, pain

Genitourinary: Vaginal itching (female partner), testicular pain, urethral bleeding (minor)

<2%: Tachycardia, perineal pain, leg pain

Intracavernosal injection:

>10%: Genitourinary: Penile pain

1% to 10%:

Cardiovascular: Hypertension

Central nervous system: Headache, dizziness

Genitourinary: Prolonged erection (>4 hours, 4%), penile fibrosis, penis disorder, penile rash, penile edema

Local: Injection site hematoma and/or bruising

<1%: Balanitis, injection site hemorrhage, priapism (0.4%)

Intravenous:

>10%:

Cardiovascular: Flushing

Central nervous system: Fever

Respiratory: Apnea

1% to 10%:

Cardiovascular: Bradycardia, hyper-/hypotension, tachycardia, cardiac arrest, edema

Central nervous system: Seizure, headache, dizziness

Endocrine & metabolic: Hypokalemia

Gastrointestinal: Diarrhea

Hematologic: Disseminated intravascular coagulation

Neuromuscular & skeletal: Back pain

Respiratory: Upper respiratory infection, flu syndrome, sinusitis, nasal congestion, cough

Miscellaneous: Sepsis, localized pain in structures other than the injection site

<1%: Anemia, anuria, bleeding, bradypnea, bronchial wheezing, cerebral bleeding, CHF, gastric regurgitation, hematuria, hyperbilirubinemia, hyperemia, hyperextension of neck, hyperirritability, hyperkalemia, hypoglycemia, hypothermia, jitteriness, lethargy, peritonitis, second-degree heart block, shock, stiffness, supraventricular tachycardia, thrombocytopenia, ventricular fibrillation

Drug InteractionsThere are no known significant interactions.
Ethanol/Nutrition/Herb InteractionsEthanol: Avoid concurrent use (vasodilating effect).

Monitoring ParametersArterial pressure, respiratory rate, heart rate, temperature, degree of penile pain, length of erection, signs of infection

Nursing: Physical Assessment/Monitoring**Neonate:** Monitor closely; apnea has occurred during first hour after administration. **Erectile dysfunction:** After individual dose titration is determined by prescriber, the Caverject® injection (or Muse®) is generally self-administered. Teach patient proper use if self-administered (appropriate injection technique and syringe/needle disposal), possible side effects/appropriate interventions, and adverse symptoms to report. **Pregnancy risk factor X:** See Pregnancy Issues.

Patient EducationUse only as directed, no more than 3 times/week, allowing 24 hours between injections. Avoid alcohol. Store in refrigerator and dilute with supplied diluent immediately before use. Use alternate sides of penis with each injection. Dispose of syringes and needle and single-dose vials in a safe manner (do not share medication, syringes, or needles). Note that the risk of transmitting blood-borne disease is increased with use of alprostadil injections since a small amount of bleeding at injection site is possible. Stop using and contact prescriber immediately if signs of priapism occur, erections last more than 4 hours, or you experience moderate to severe penile pain. Report penile problems (eg, nodules, new penile pain, rash, bruising, numbness, swelling, signs of infection, abnormal ejaculations); cardiac symptoms (hypo- or hypertension, chest pain, palpitations, irregular heartbeat); flushing, fever, flu-like symptoms; respiratory difficulty or wheezing; or other adverse reactions. Refer to prescriber every 3 months to ensure proper technique and for dosage evaluation. **Pregnancy precautions:** Consult prescriber about use of contraceptives. Do not give blood while taking this medication and for 1 month following discontinuance.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, powder for reconstitution:

Caverject®: 20 mcg, 40 mcg [contains lactose; diluent contains benzyl alcohol]

Caverject Impulse®: 10 mcg, 20 mcg [prefilled injection system; contains lactose; diluent contains benzyl alcohol]

Edex®: 10 mcg, 20 mcg, 40 mcg [contains lactose; packaged in kits containing diluent, syringe, and alcohol swab]

Injection, solution: 500 mcg/mL (1 mL)

Prostin VR Pediatric®: 500 mcg/mL (1 mL) [contains dehydrated alcohol]

Pellet, urethral:

Muse®: 125 mcg (6s) [DSC], 250 mcg (6s), 500 mcg (6s), 1000 mcg (6s)

Generic AvailableYes: Solution for injection

Pricing: U.S. (www.drugstore.com)

Kit (Caverject Impulse)

10 mcg (2): $66.14

20 mcg (2): $83.99

Kit (Edex)

10 mcg (1): $64.99

10 mcg (1): $170.99

20 mcg (1): $79.99

20 mcg (1): $216.99

40 mcg (1): $106.54

40 mcg (1): $295.63

Pellet (Muse)

125 mcg (6): $154.70

250 mcg (6): $161.07

500 mcg (6): $171.68

1000 mcg (6): $186.49

Solution (reconstituted) (Caverject)

40 mcg (6): $259.98

Mechanism of ActionCauses vasodilation by means of direct effect on vascular and ductus arteriosus smooth muscle; relaxes trabecular smooth muscle by dilation of cavernosal arteries when injected along the penile shaft, allowing blood flow to and entrapment in the lacunar spaces of the penis (ie, corporeal veno-occlusive mechanism)

Pharmacodynamics/Kinetics

Onset of action: Rapid

Duration: <1 hour

Distribution: Insignificant following penile injection

Protein binding, plasma: 81% to albumin

Metabolism: ~75% by oxidation in one pass via lungs

Half-life elimination: 5-10 minutes

Excretion: Urine (90% as metabolites) within 24 hours

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause dizziness; rarely may produce irritability

Mental Health: Effects on Psychiatric TreatmentMay cause seizures; use caution with clozapine and bupropion

Alteplase

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Alteplase may be confused with Altace®

"tPA" abbreviation should not be used when writing orders for this medication; has been misread as TNKase (tenecteplase)

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (I.V.) among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(AL te plase)

U.S. Brand NamesActivase®; Cathflo® Activase®

Canadian Brand NamesActivase® rt-PA; Cathflo® Activase®

Pharmacologic CategoryThrombolytic Agent

Use: Labeled IndicationsManagement of ST-elevation myocardial infarction (STEMI) for the lysis of thrombi in coronary arteries; management of acute ischemic stroke (AIS); management of acute pulmonary embolism

Recommended criteria for treatment:

STEMI: Chest pain ≥20 minutes duration, onset of chest pain within 12 hours of treatment (or within prior 12-24 hours in patients with continuing ischemic symptoms), and ST-segment elevation >0.1 mV in at least two contiguous precordial leads or two adjacent limb leads on ECG or new or presumably new left bundle branch block (LBBB)

AIS: Onset of stroke symptoms within 3 hours of treatment

Acute pulmonary embolism: Age ≤75 years: Documented massive pulmonary embolism by pulmonary angiography or echocardiography or high probability lung scan with clinical shock

Cathflo® Activase®: Restoration of central venous catheter function

Use: Unlabeled/InvestigationalAcute ischemic stroke with symptom onset within 3-4.5 hours of treatment; acute peripheral arterial occlusive disease

Dosing: Adults

ST-elevation myocardial infarction (STEMI): I.V. (Activase®): Front loading dose (weight-based):

Patients >67 kg: Total dose: 100 mg over 1.5 hours; infuse 15 mg over 1-2 minutes. Infuse 50 mg over 30 minutes. Infuse remaining 35 mg of alteplase over the next hour. See "Note."

Patients ≤67 kg: Infuse 15 mg I.V. bolus over 1-2 minutes, then infuse 0.75 mg/kg (not to exceed 50 mg) over next 30 minutes, followed by 0.5 mg/kg over next 60 minutes (not to exceed 35 mg). See "Note."

Note: All patients should receive 162-325 mg of chewable nonenteric coated aspirin as soon as possible and then daily. Administer concurrently with heparin 60 units/kg bolus (maximum: 4000 units) followed by continuous infusion of 12 units/kg/hour (maximum: 1000 units/hour) and adjust to aPTT target of 50-70 seconds (or 1.5-2 times the upper limit of control).

Acute pulmonary embolism: I.V. (Activase®): 100 mg over 2 hours.

Acute ischemic stroke: I.V. (Activase®): Doses should be given within the first 3 hours of the onset of symptoms; **Note:** Initiation of anticoagulants (eg, heparin) or antiplatelet agents (eg, aspirin) within 24 hours after starting alteplase is not recommended; however, initiation of aspirin between 24-48 hours after stroke onset is recommended (Adams, 2007).

Recommended total dose: 0.9 mg/kg (maximum total dose: 90 mg)

Patients ≤100 kg: Load with 0.09 mg/kg (10% of 0.9 mg/kg dose) as an I.V. bolus over 1 minute, followed by 0.81 mg/kg (90% of 0.9 mg/kg dose) as a continuous infusion over 60 minutes.

Patients >100 kg: Load with 9 mg (10% of 90 mg) as an I.V. bolus over 1 minute, followed by 81 mg (90% of 90 mg) as a continuous infusion over 60 minutes.

Unlabeled use: Administration of alteplase may be of benefit for select patients with acute ischemic stroke who present between 3 and 4.5 hours after onset of symptoms (Hacke, 2008)

Central venous catheter clearance: Intracatheter (Cathflo® Activase® 1 mg/mL):

Patients <30 kg: 110% of the internal lumen volume of the catheter, not to exceed 2 mg/2 mL; retain in catheter for 0.5-2 hours; may instill a second dose if catheter remains occluded

Patients ≥30 kg: 2 mg (2 mL); retain in catheter for 0.5-2 hours; may instill a second dose if catheter remains occluded

Acute peripheral arterial occlusive disease (unlabeled use): Intra-arterial: 0.02-0.1 mg/kg/hour for up to 36 hours

Advisory Panel to the Society for Cardiovascular and Interventional Radiology on Thrombolytic Therapy recommendation: ≤2 mg/hour and subtherapeutic heparin (aPTT <1.5 times baseline)

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricCentral venous catheter clearance: Intracatheter: Patients <30 kg: 110% of the internal lumen volume of the catheter, not to exceed 2 mg/2 mL; retain in catheter for 0.5-2 hours; may instill a second dose if catheter remains occluded

Administration: I.V.

Activase®: ST-elevation MI: Accelerated infusion: Bolus dose may be prepared by one of three methods:

1) Removal of 15 mL reconstituted (1 mg/mL) solution from vial

2) Removal of 15 mL from a port on the infusion line after priming

3) Programming an infusion pump to deliver a 15 mL bolus at the initiation of infusion

Activase®: Acute ischemic stroke: Bolus dose (10% of total dose) may be prepared by one of three methods:

1) Removal of the appropriate volume from reconstituted solution (1 mg/mL)

2) Removal of the appropriate volume from a port on the infusion line after priming

3) Programming an infusion pump to deliver the appropriate volume at the initiation of infusion

Note: Remaining dose for STEMI, AIS, or total dose for acute pulmonary embolism may be administered as follows: Any quantity of drug not to be administered to the patient must be removed from vial(s) prior to administration of remaining dose.

50 mg vial: Either PVC bag or glass vial and infusion set

100 mg vial: Insert spike end of the infusion set through the same puncture site created by transfer device and infuse from vial

If further dilution is desired, may be diluted in equal volume of 0.9% sodium chloride or D$_5$W to yield a final concentration of 0.5 mg/mL.

Administration: I.V. DetailReconstituted solution should be clear or pale yellow and transparent. Avoid agitation during dilution.

pH: 5-7.3

Administration: OtherCathflo® Activase®: Intracatheter: Instill dose into occluded catheter. Do not force solution into catheter. After a 30-minute dwell time, assess catheter function by attempting to aspirate blood. If catheter is functional, aspirate 4-5 mL of blood in patients ≥10 kg or 3 mL in patients <10 kg to remove Cathflo® Activase® and residual clots. Gently irrigate the catheter with NS. If catheter remains nonfunctional, let Cathflo® Activase® dwell for another 90 minutes (total dwell time: 120 minutes) and reassess function. If catheter function is not restored, a second dose may be instilled.

Storage

Activase®: The lyophilized product may be stored at room temperature (not to exceed 30°C/86°F), or under refrigeration. Once reconstituted it should be used within 8 hours.

Cathflo® Activase®: Store lyophilized product in refrigerator. Once reconstituted, store at 2°C to 30°C (36°F to 86°F) and use within 8 hours.

Reconstitution

Activase®:

50 mg vial: Use accompanying diluent (50 mL sterile water for injection); do not shake. Final concentration: 1 mg/mL.

100 mg vial: Use transfer set with accompanying diluent (100 mL vial of sterile water for injection); no vacuum is present in 100 mg vial. Final concentration: 1 mg/mL.

Cathflo® Activase®: Add 2.2 mL SWFI to vial; do not shake. Final concentration: 1 mg/mL.

CompatibilityStable in NS, sterile water for injection; **incompatible** with bacteriostatic water; **variable stability (consult detailed reference)** in D$_5$W.

Y-site administration: Compatible: Lidocaine, metoprolol, propranolol. **Incompatible:** Dobutamine, dopamine, heparin, nitroglycerin.

Compatibility when admixed: Compatible: Lidocaine, morphine, nitroglycerin. **Incompatible:** Dobutamine, dopamine, heparin.

ContraindicationsHypersensitivity to alteplase or any component of the formulation

Treatment of STEMI or PE: Active internal bleeding; history of CVA; recent intracranial or intraspinal surgery or trauma; intracranial neoplasm; arteriovenous malformation or aneurysm; known bleeding diathesis; severe uncontrolled hypertension

Treatment of acute ischemic stroke: Evidence of intracranial hemorrhage or suspicion of subarachnoid hemorrhage on pretreatment evaluation; recent (within 3 months) intracranial or intraspinal surgery; prolonged external cardiac massage; suspected aortic dissection; serious head trauma or previous stroke; history of intracranial hemorrhage; uncontrolled hypertension at time of treatment (eg, >185 mm Hg systolic or >110 mm Hg diastolic); seizure at the onset of stroke; active internal bleeding; intracranial neoplasm; arteriovenous malformation or aneurysm; known bleeding diathesis including but not limited to: current use of anticoagulants or an INR >1.7, administration of heparin within 48 hours preceding the onset of stroke and an elevated aPTT at presentation, platelet count <100,000/mm^3.

Other exclusion criteria (NINDS recombinant tPA study): Stroke or serious head injury within 3 months, major surgery or serious trauma within 2 weeks, GI or urinary tract hemorrhage within 3 weeks, aggressive treatment required to lower blood pressure, glucose level <50 mg/dL or >400 mg/dL, arterial puncture at a noncompressible site or lumbar puncture within 1 week, clinical presentation suggesting post-MI pericarditis, pregnancy, breast-feeding.

Allergy Considerations

- Thrombolytic Agent, Fibrin-Specific Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Arrhythmias: Coronary thrombolysis may result in reperfusion arrhythmias.
- Bleeding: Doses >150 mg are associated with increased risk of intracranial hemorrhage; monitor all potential bleeding sites. If serious bleeding occurs, the infusion of alteplase and heparin should be stopped.

Disease-related concerns:

- Conditions that increase bleeding risk: For the following conditions, the risk of bleeding is higher with use of thrombolytics and should be weighed against the benefits of therapy: Recent (within 10 days) major surgery (eg, CABG, obstetrical delivery, organ biopsy, previous puncture of noncompressible vessels), cerebrovascular disease, recent gastrointestinal or genitourinary bleeding, recent trauma, hypertension (systolic BP >175 mm Hg and/or diastolic BP >110 mm Hg), high likelihood of left heart thrombus (eg, mitral stenosis with atrial fibrillation), acute pericarditis, subacute bacterial endocarditis, hemostatic defects including ones caused by severe renal or hepatic dysfunction, significant hepatic dysfunction, diabetic hemorrhagic retinopathy or other hemorrhagic ophthalmic conditions, septic thrombophlebitis or occluded AV cannula at seriously infected site and/or any other condition in which bleeding constitutes a significant hazard or would be particularly difficult to manage because of location.
- ST-elevation myocardial infarction (STEMI): Appropriate use: Follow standard management for STEMI while infusing alteplase.
- Stroke: Appropriate use: Treatment of patients with acute ischemic stroke more than 3 hours after symptom onset is not recommended. Treatment of patients with minor neurological deficit or with rapidly improving symptoms is not recommended.

Concurrent drug therapy issues:

- Anticoagulants: Use with caution in patients receiving oral anticoagulants; increased risk of bleeding.
- Heparin: Concurrent heparin anticoagulation may contribute to bleeding.

Special populations:

- Elderly: Use with caution in patients with advanced age (eg, >75 years); increased risk of bleeding.
- Pregnancy: Use with caution in pregnancy; increased risk of bleeding.

Dosage form specific issues:

- Cathflo® Activase®: When used to restore catheter function, use Cathflo® cautiously in those patients with known or suspected catheter infections. Evaluate catheter for other causes of dysfunction before use. Avoid excessive pressure when instilling into catheter.

Other warnings/precautions:

- Administration: Intramuscular injections and nonessential handling of the patient should be avoided. Venipunctures should be performed carefully and only when necessary. If arterial puncture is necessary, use an upper extremity vessel that can be manually compressed.

Geriatric ConsiderationsNo specific changes in use in elderly patients are necessary.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsAs with all drugs which may affect hemostasis, bleeding is the major adverse effect associated with alteplase. Hemorrhage may occur at virtually any site. Risk is dependent on multiple variables, including the dosage administered, concurrent use of multiple agents which alter hemostasis, and patient predisposition. Rapid lysis of coronary artery thrombi by thrombolytic agents may be associated with reperfusion-related atrial and/or ventricular arrhythmia. **Note:** Lowest rate of bleeding complications expected with dose used to restore catheter function.

1% to 10%:

Cardiovascular: Hypotension

Central nervous system: Fever

Dermatologic: Bruising (1%)

Gastrointestinal: GI hemorrhage (5%), nausea, vomiting

Genitourinary: GU hemorrhage (4%)

Hematologic: Bleeding (0.5% major, 7% minor: GUSTO trial)

Local: Bleeding at catheter puncture site (15.3%, accelerated administration)

<1% (Limited to important or life-threatening): Intracranial hemorrhage (0.4% to 0.87% when dose is ≤100 mg), retroperitoneal hemorrhage, pericardial hemorrhage, gingival hemorrhage, epistaxis, allergic reactions: anaphylaxis, anaphylactoid reactions, laryngeal edema, rash, and urticaria (<0.02%).

Additional cardiovascular events associated **with use in STEMI:** AV block, cardiogenic shock, heart failure, cardiac arrest, recurrent ischemia/infarction, myocardial rupture, electromechanical dissociation, pericardial effusion, pericarditis, mitral regurgitation, cardiac tamponade, thromboembolism, pulmonary edema, asystole, ventricular tachycardia, bradycardia, ruptured intracranial AV malformation, seizure, hemorrhagic bursitis, cholesterol crystal embolization

Additional events associated **with use in pulmonary embolism:** Pulmonary re-embolization, pulmonary edema, pleural effusion, thromboembolism

Additional events associated **with use in stroke:** Cerebral edema, cerebral herniation, seizure, new ischemic stroke

Drug Interactions

Anticoagulants: Thrombolytic Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of Thrombolytic Agents. *Risk C: Monitor therapy*

Aprotinin: May diminish the therapeutic effect of Thrombolytic Agents. *Risk D: Consider therapy modification*

Drotrecogin Alfa: Thrombolytic Agents may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Thrombolytic Agents. Bleeding may occur. *Risk D: Consider therapy modification*

Nitroglycerin: May decrease the serum concentration of Alteplase. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Salicylates: May enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid cat's claw, dong quai, evening primrose, feverfew, red clover, horse chestnut, garlic, green tea, ginseng, ginkgo (all have additional antiplatelet activity).

Test InteractionsAltered results of coagulation and fibrinolytic agents

Monitoring Parameters

Acute ischemic stroke: In addition to monitoring for bleeding complications, the 2007 AHA/ASA Guidelines for the early management of acute ischemic stroke recommends the following:

Perform neurological assessments every 15 minutes during infusion and every 30 minutes thereafter for the next 6 hours, then hourly until 24 hours after treatment.

If severe headache, acute hypertension, nausea, or vomiting occurs, discontinue the infusion and obtain emergency CT scan.

Measure BP every 15 minutes for the first 2 hours then every 30 minutes for the next 6 hours, then hourly until 24 hours after initiation of alteplase. Increase frequency if a systolic BP is ≥180 mm Hg or if a diastolic BP is ≥105 mm Hg; administer antihypertensive medications to maintain BP at or below these levels.

Obtain a follow-up CT scan at 24 hours before starting anticoagulants or antiplatelet agents.

Central venous catheter clearance: Assess catheter function by attempting to aspirate blood.

ST-elevation MI: Assess for evidence of cardiac reperfusion through resolution of chest pain, resolution of baseline ECG changes, preserved left ventricular function, cardiac enzyme washout phenomenon, and/or the appearance of reperfusion arrhythmias; assess for bleeding potential through clinical evidence of GI bleeding, hematuria, gingival bleeding, fibrinogen levels, fibrinogen degradation products, prothrombin times, and partial thromboplastin times.

Reference Range

Not routinely measured; literature supports therapeutic levels of 0.52-1.8 mcg/mL

Fibrinogen: 200-400 mg/dL

Activated partial thromboplastin time (aPTT): 22.5-38.7 seconds

Prothrombin time (PT): 10.9-12.2 seconds

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (especially those medications that may affect coagulation or platelet function). Assess vital signs, results of laboratory tests, and ECG prior to, during, and after therapy. Arrhythmias may occur; antiarrhythmic drugs should be immediately available. Infusion site should be monitored and patient assessed for hemorrhage every 10 minutes (or according to institutional policy) during therapy and for 1 hour following therapy. Strict bedrest should be maintained and bleeding precautions should be instituted; avoid invasive procedures and activities that could cause trauma. Patient instructions determined by patient condition.

Monitoring: Lab TestsCBC, PTT

Patient EducationThis medication can only be administered by infusion; you will be monitored closely during and after treatment. You will have a tendency to bleed easily; use caution to prevent injury (use electric razor, soft toothbrush, and use caution with knives, needles, or anything sharp). Follow instructions for strict bedrest to reduce the risk of injury. If bleeding occurs, report immediately and apply pressure to bleeding spot until bleeding stops completely. Report unusual pain (acute headache, joint pain, chest pain); unusual bruising or bleeding; blood in urine, stool, or vomit; bleeding gums; vision changes; or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, recombinant:

Activase®: 50 mg [29 million int. units; contains polysorbate 80; packaged with diluent]; 100 mg [58 million int. units; contains polysorbate 80; packaged with diluent and transfer device]

Cathflo® Activase®: 2 mg [contains polysorbate 80]

Generic AvailableNo

ManufacturerGenentech, Inc

Mechanism of ActionInitiates local fibrinolysis by binding to fibrin in a thrombus (clot) and converts entrapped plasminogen to plasmin

Pharmacodynamics/Kinetics

Duration: >50% present in plasma cleared ~5 minutes after infusion terminated, ~80% cleared within 10 minutes

Excretion: Clearance: Rapidly from circulating plasma (550-650 mL/minute), primarily hepatic; >50% present in plasma is cleared within 5 minutes after the infusion is terminated, ~80% cleared within 10 minutes

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: As with all drugs which may affect hemostasis, bleeding is the major adverse effect associated with alteplase. Hemorrhage may occur at virtually any site; risk is dependent on multiple variables, including the dosage administered, concurrent use of multiple agents which alter hemostasis, and patient predisposition. Rapid lysis of coronary artery thrombi by thrombolytic agents may be associated with reperfusion-related atrial and/or ventricular arrhythmias.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular Considerations

ST-Elevation Myocardial Infarction: The 2004 ACC/AHA guidelines for the management of patients with ST-elevation myocardial infarction recommend prehospital thrombolysis in special circumstances (eg, transport time >30 minutes). Efforts to quickly identify and safely treat appropriate candidates for therapy continue. Reducing treatment delays is very important to improve mortality. Thrombolytic therapy is indicated in patients with ST-segment elevation >1 mm in two or more contiguous leads or at least two adjacent limb leads in patients with chest discomfort >30 minutes but ≤12 hours. Patients with chest discomfort suggestive of ischemia and new-onset left bundle branch block (LBBB) are also candidates for thrombolysis. Generally, there is only a small trend for benefit of therapy after a delay of more than 12-24 hours, but thrombolysis may be considered for selected patients with ongoing ischemic pain and extensive ST elevation. Additional absolute contraindications for fibrinolysis use in ST-elevation myocardial infarction from the 2004 ACC/AHA guidelines: Any prior intracranial hemorrhage, ischemic stroke within 3 months (except one within 3 hours), significant closed head or facial trauma within 3 months. Additional relative contraindications include history of chronic severe, poorly-controlled hypertension, severe uncontrolled hypertension on presentation (systolic BP >180 mm Hg or diastolic >110 mm Hg; could be an absolute contraindication in low-risk patients), history of prior ischemic stroke >3 months, dementia, or known intracranial pathology, traumatic or prolonged (>10 minutes) CPR or major surgery (<3 weeks), recent (within 2-4 weeks) internal bleeding, noncompressible vascular punctures, pregnancy, active peptic ulcer, current use of anticoagulants.

Thrombolytic and GP IIb/IIIa Inhibitor: In the GUSTO V trial, patients with STEMI were randomized to standard-dose reteplase or half-dose reteplase (two boluses of 5 units each, 30 minutes apart) and full dose abciximab. Thirty-day mortality (primary endpoint) was similar in both groups. The combination treatment group had fewer deaths or nonfatal reinfarctions, less need for urgent revascularization, and fewer major ischemic complications. More bleeding occurred in the combination treatment group, but intracranial hemorrhage and nonfatal disabling stroke were similar in both groups. All cause mortality at one year was similar in both groups. In TIMI 14, the combination of full-dose abciximab (0.25 mg/kg bolus followed by a 12-hour infusion of 0.125 mcg/kg/minute, maximum 10 mcg/minute) and half-dose alteplase (15 mg bolus followed by 35 mg infusion over 60 minutes) resulted in 74% of patients achieving TIMI grade 3 flow at 90 minutes. The 2004 ACC/AHA guidelines for the management of patients with STEMI suggests that abciximab and half-dose reteplase or tenecteplase may be considered for prevention of reinfarction in patients with an anterior MI, who are <75 years of age, and who have no risk factors for bleeding.

However, more recently, the 2008 American College of Chest Physicians guidelines recommends against the combination of half-dose reteplase or tenecteplase and standard-dose abciximab (with low dose unfractionated heparin) in any patient with STEMI due to the lack of mortality benefit and the risk of major bleeding (Goodman, 2008).

Anesthesia and Critical Care Concerns/Other Considerations

Acute Ischemic Stroke (AIS):

Presentation within 0-3 hours of stroke onset (FDA approved): Based on the National Institute of Neurological Disorders and Stroke (NINDS) rt-PA stroke study, administration of alteplase within 0-3 hours after symptom onset is an established therapeutic modality in the treatment of AIS. The NINDS trial demonstrated significant neurological improvement at 24 hours and a greater number of patients experienced a favorable outcome (complete or nearly complete neurological recovery) at 90 days if they received alteplase compared to those receiving placebo. The decision to administer alteplase should be made after careful consideration of the patient's eligibility including level of neurological deficit, time of presentation, and existence of contraindications to alteplase (eg, intracranial hemorrhage). Since a powerful time-to-treatment effect exists with the administration of alteplase for AIS, any delay in treatment once a patient is identified to be a candidate for alteplase may compromise efficacy and possibly safety. With administration of alteplase for AIS, the clinician should be keenly aware of the potential serious side effect of bleeding especially intracranial hemorrhage (ICH) which occurs at a rate of approximately 6% in this population. Strict adherence to established protocols is necessary to prevent higher rates of ICH. Orolingual angioedema, a rare but serious complication, may also occur and compromise the airway.

Presentation within 3-4.5 hours of stroke onset (non-FDA approved): Administration of alteplase is currently recommended for patients with AIS who may be treated within 3 hours of symptom onset (2007 AHA/ASA guideline). However, more recently, the European Cooperative Acute Stroke Study III (ECASS III; Hacke, 2008), a double-blind, multicenter trial enrolled 821 patients with AIS presenting with onset of stroke symptoms between 3-4.5 hours. Patients were randomized to either placebo or standard-dose alteplase (total dose: 0.9 mg/kg over 60 minutes; maximum: 90 mg; with 10% of 0.9 mg/kg given as loading dose). Patients were excluded if they had evidence of brain hemorrhage or major infarction. Other notable exclusion criteria were age >80 years, severe stroke as assessed clinically (eg, NIH Stroke Scale >25) and/or by appropriate imaging techniques, and history of prior stroke and concomitant diabetes. The primary endpoint was disability at 90 days, dichotomized as a favorable or unfavorable outcome (score of 0-1 or 2-6 on the modified Rankin scale, respectively). The secondary endpoint was a global outcome analysis that combined the outcomes at day 90 of four neurologic and disability scores (modified Rankin scale, Barthel Index, NIH Stroke Scale, and Glasgow Outcome Scale). Median time to alteplase treatment was 239 minutes (3.9 hours) after onset of stroke symptoms. Compared to those who received placebo, patients receiving alteplase experienced less disability at 90 days (219 [52.4%] vs 182 [45.2%], p=0.04). A favorable global outcome was statistically more frequent with alteplase compared to placebo. More cases of intracranial hemorrhage (ICH) occurred in the alteplase group compared to placebo (any ICH, 113 [27%] vs 71 [17.6%], p=0.001; symptomatic ICH 10 [2.4%] vs 1 [0.2%], p=0.008), a rate similar to that of previous clinical trials when used within 0-3 hours. Although not a primary endpoint of the trial, there was no difference in mortality between the two groups (32 [7.7%] vs 34 [8.4%], p=0.68). ECASS III suggests the extension of the time window for treatment with alteplase. However, treatment should not be delayed for any appropriate candidate presenting with AIS.

Acute Pulmonary Embolism (PE): The American College of Chest Physicians (Kearon, 2008) recommends the following:

All patients with acute PE: All patients with diagnosed PE should undergo rapid risk stratification based on risk of death from PE and bleeding. In general, the majority of patients with PE will not require treatment with thrombolytics; however, treatment with anticoagulation (eg, enoxaparin, heparin) will be necessary unless contraindicated.

Patients with acute PE without hemodynamic compromise: In general, patients without hemodynamic compromise should not receive thrombolytic therapy. However, patients without hemodynamic compromise but with poor prognostic indicators (elevated troponin, right ventricular dysfunction on echocardiogram, etc) are at high risk of an adverse outcome and may derive benefit from receiving systemic thrombolysis. Therefore, the most recent recommendation is to administer thrombolysis in these selected high-risk patients who have a low risk of bleeding. The use of regimens with short infusion times (eg, 2-hour infusion) is recommended over longer infusion times (eg, 12-hour infusions). The most widely used thrombolytic for this indication is alteplase which is administered as an infusion of 100 mg over 2 hours. Urokinase may also be used; however, the administration time for urokinase is 12 hours.

Patients with acute PE with hemodynamic compromise: Since thrombolytic therapy has been shown to accelerate thrombolysis resulting in more rapid resolution of perfusion scan abnormalities, decrement angiographic thrombus, reduction in elevated pulmonary artery pressures, and normalization of right ventricular dysfunction in patients with PE and hemodynamic compromise (usually defined as SBP <90 mm Hg requiring vasopressor therapy), the use of thrombolytic therapy via a peripheral vein is recommended unless major contraindications exist. The use of regimens with short infusion times (eg, 2-hour infusion) is recommended over longer infusion times (eg, 12-hour infusions). The most widely used thrombolytic for this indication is alteplase which is administered as an infusion of 100 mg over 2 hours. Urokinase may also be used; however, the administration time for urokinase is 12 hours.

Patients with PE experiencing cardiac arrest: According to the 2005 ACLS guidelines, when PE is responsible for cardiac arrest and the patient is unresponsive to cardiopulmonary resuscitation (CPR), it is reasonable to administer bolus thrombolytic therapy, specifically alteplase (Böttiger, 2001); however, routine use in cardiac arrest or undifferentiated pulseless electrical activity (PEA) is not recommended. Of note, ongoing CPR is not a contraindication in this setting.

Intracerebral Hemorrhage (ICH) Due to Thrombolysis: Overall management of ICH is similar regardless of cause; however, iatrogenic spontaneous ICH may have specific treatments. According to the 2007 ACC/ASA Guidelines for the Management of Spontaneous Intracerebral Hemorrhage, fibrinolytic-related ICH should be treated with infusion of platelets (6-8 units) and cryoprecipitate which contains factor VIII (Class IIb recommendation).

Peripheral Arterial Occlusive Disease (PAOD) and Deep Venous Thrombosis (DVT): The Surgery Versus Thrombolysis for Ischemia of the Lower Extremity (STILE) trial (*Ann Surg*, 1994) compared surgery to intra-arterial thrombolytic therapy with either urokinase (250,000 units bolus, followed by 4000 units/minute for 4 hours, followed by 2000 units/minute for ≤36 hours) or alteplase (0.05 mg/kg/hour for ≤12 hours) in patients with acute (<14 days) or chronic peripheral arterial occlusive disease (PAOD). Patients with acute PAOD who received either fibrinolytic treatment had a shorter hospital stay and an improved amputation-free survival rate. There was no difference between alteplase or urokinase with regard to efficacy or bleeding events. A group from Stanford University recently did a retrospective comparison evaluating efficacy, safety, and cost of low-dose alteplase (<2 mg/hour) and subtherapeutic heparin to urokinase and therapeutic heparin for the treatment of PAOD or DVT (Sugimoto, 2003). Efficacy was similar for both groups. The average dose of alteplase was 0.86 mg/hour and the dose of urokinase was 2250 units/minute. Alteplase infusions were shorter and less expensive than urokinase.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

International issues:

Hexalen®: Brand name for hexetidine in Greece

Pronunciation(al TRET a meen)

U.S. Brand NamesHexalen®

Canadian Brand NamesHexalen®

Pharmacologic CategoryAntineoplastic Agent, Miscellaneous

Use: Labeled IndicationsPalliative treatment of persistent or recurrent ovarian cancer

Dosing: AdultsRefer to individual protocols.

Ovarian cancer: Oral: 260 mg/m^2/day in 4 divided doses for 14 or 21 days of a 28-day cycle

Alternatively (unlabeled use): 4-12 mg/kg/day in 3-4 divided doses for 21-90 days

Alternatively (unlabeled use): 240-320 mg/m^2/day in 3-4 divided doses for 21 days, repeated every 6 weeks

Alternatively (unlabeled use): 150 mg/m^2/day in 3-4 divided doses for 14 days of a 28-day cycle

Dosing: ElderlyRefer to adult dosing.

Dosing: Adjustment for ToxicityTemporarily withhold for 14 days or longer, and resume dose at 200 mg/m^2/day for any of the following:

Platelet count <75,000/mm^3

White blood cell count <2000/mm^3 or granulocyte count <1000/mm^3

Progressive neurotoxicity

Gastrointestinal intolerance not responsive to antiemetic regimens

Calculations

- Body Surface Area: Adults

Administration: OralAdminister total daily dose as 3-4 divided doses after meals and at bedtime.

Dietary ConsiderationsShould be taken after meals at bedtime.

StorageStore at 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to altretamine or any component of the formulation; pre-existing severe bone marrow suppression or severe neurologic toxicity; pregnancy

Warnings/Precautions

Boxed warnings:

- Bone marrow suppression: See “Concerns related to adverse effects” below.
- Experienced physician: See “Other warnings/precautions” below.
- Neurotoxicity: See “Concerns related to adverse effects” below.

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: **[U.S. Boxed Warning]: Peripheral blood counts should be done routinely before and after drug therapy;** bone marrow suppression is common. Use with caution in patients previously treated with other myelosuppressive drugs.
- Neurotoxicity: **[U.S. Boxed Warning]: Neurologic examinations should be done routinely before and after drug therapy;** neurotoxicity is common. USe with caution in patients with pre-existing neurotoxicity.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Experienced physician: **[U.S. Boxed Warning]: Should be administered under the supervision of an experienced cancer chemotherapy physician.**

Pregnancy Risk FactorD

Pregnancy ConsiderationsTeratogenic effects were noted in animal studies. There are no adequate and well-controlled studies in pregnant women. Women of childbearing potential should avoid becoming pregnant while on therapy.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential toxicity in the nursing infant, breast-feeding is not recommended.

Adverse Reactions

>10%:

Central nervous system: Peripheral sensory neuropathy (31%; moderate-to-severe 9%), neurotoxicity (21%; may be progressive and dose limiting)

Gastrointestinal: Nausea/vomiting (33% to 70%; severe 1%), diarrhea (48%)

Hematologic: Anemia (33%), leukopenia (5% to 15%; grade 4: 1%), neutropenia

1% to 10%:

Central nervous system: Fatigue (1%), seizure (1%)

Gastrointestinal: Stomach cramps, anorexia (1%)

Hematologic: Thrombocytopenia (9%)

Hepatic: Alkaline phosphatase increased (9%)

<1%: Alopecia, ataxia, depression, dizziness, hepatotoxicity, mood disorders, pruritus, rash, tremor, vertigo

Oncology: Emetic PotentialModerate-to-high (30% to 90%)

Drug Interactions

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

MAO Inhibitors: Altretamine may enhance the orthostatic effect of MAO Inhibitors. *Risk C: Monitor therapy*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Pyridoxine: May diminish the therapeutic effect of Altretamine. Specifically when altretamine is used in combination with Cisplatin the response duration may be diminished. *Risk D: Consider therapy modification*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Tricyclic Antidepressants: Altretamine may enhance the orthostatic effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Monitoring ParametersCBC with differential, liver function tests; neurologic examination

Nursing: Physical Assessment/MonitoringAssess need for caution (eg, patients previously treated with other myelosuppressive drugs or with pre-existing neurotoxicity; renal or hepatic dysfunction). Monitor potential for drug/drug interactions. Assess results of laboratory tests, therapeutic effectiveness, and adverse response (eg, neuropathy, gastrointestinal upset, anemia). Teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsCBC with differential, liver function tests

Patient EducationDo not take any new medications (including aspirin or any aspirin-containing products) during treatment unless approved by prescriber. Take exactly as directed, preferably after meals. Avoid alcohol. May cause nausea or vomiting (small, frequent meals, good mouth care, chewing gum, or sucking lozenges may help). You will be more susceptible to infection (avoid crowds and exposure to infection). Report any numbness, tingling, or pain in extremities; unrelieved nausea or vomiting; tremors; yellowing of skin or eyes; fever; chills; easy bruising or unusual bleeding; extreme weakness; or increased fatigue. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication. Consult prescriber for appropriate barrier contraceptive measures. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Gelcap:

Hexalen®: 50 mg

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Capsules (Hexalen)

50 mg (100): $1120.62

Mechanism of ActionAlthough altretamine's clinical antitumor spectrum resembles that of alkylating agents, the drug has demonstrated activity in alkylator-resistant patients. The drug selectively inhibits the incorporation of radioactive thymidine and uridine into DNA and RNA, inhibiting DNA and RNA synthesis; reactive intermediates covalently bind to microsomal proteins and DNA; can spontaneously degrade to demethylated melamines and formaldehyde which are also cytotoxic.

Pharmacodynamics/Kinetics

Absorption: Well absorbed (75% to 89%)

Distribution: Highly concentrated hepatically and renally; low in other organs

Protein binding: 50% to 94%

Metabolism: Hepatic; rapid and extensive demethylation to active metabolites (pentamethylmelamine and tetramethylmelamine)

Half-life elimination: 13 hours

Time to peak, plasma: 0.5-3 hours

Excretion: Urine (90%, <1% as unchanged drug)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNeurotoxicity is common; rarely may produce depression

Mental Health: Effects on Psychiatric TreatmentBone marrow suppression may be seen; use caution with carbamazepine and clozapine; may produce seizures caution with bupropion and clozapine; may cause severe orthostatic hypotension when administered with MAO inhibitors

Medication Safety Issues

Sound-alike/look-alike issues:

Drysol™ may be confused with Drisdol®

Pronunciation(a LOO mi num KLOR ide heks a HYE drate)
U.S. Brand NamesCertain Dri® [OTC]; Drysol™; Hypercare™; Xerac AC™
Pharmacologic CategoryTopical Skin Product
Use: Labeled IndicationsAstringent in the management of hyperhidrosis
Dosing: AdultsHyperhidrosis: Topical: Apply once daily at bedtime; once excessive sweating has stopped, may decrease to once or twice weekly, or as needed. Wash treated area in the morning.
Dosing: ElderlyRefer to adult dosing.
Administration: TopicalApply to dry skin. Area may be covered with plastic wrap held in place with snug-fitting T-shirt; do not hold in place with tape.
StorageKeep container tightly closed.
ContraindicationsHypersensitivity to any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Skin irritation: Discontinue if skin irritation occurs.

Other warnings/precautions:

- Appropriate use: For external use only; avoid contact with eyes. Do not apply to broken or recently shaved skin. May be harmful to certain metals or fabrics.

Adverse ReactionsFrequency not defined.

Dermatologic: Skin irritation

Local: Burning sensation, prickling sensation, transient itching or stinging

Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, topical:

Certain Dri®: 12% (36 mL)

Drysol™: 20% (35 mL, 37.5 mL, 60 mL) [contains ethanol 93%]

Hypercare™: 20% (35 mL, 37.5 mL, 60 mL) [contains ethanol 93%]

Xerac AC™: 6.25% (35 mL, 60 mL) [contains ethanol 96%]

Generic AvailableNo

Aluminum Chloride

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(a LOO mi num KLOR ide)

U.S. Brand Names Hemodent™

Pharmacologic Category Astringent; Hemostatic Agent

Use: Labeled Indications Hemostatic

Use: Dental Hemostatic; gingival retraction; to control bleeding created during a dental procedure

Dosing: Adults Control of bleeding: Apply retraction cord as directed

Dosing: Elderly Refer to adult dosing.

ContraindicationsNo data reported

Warnings/Precautions

Other warnings/precautions:

- Application: Since large amounts of astringents may cause tissue irritation and possible damage, only small amounts should be applied.

Adverse Reactions No data reported.

Drug Interactions There are no known significant interactions.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Liquid:

Hemodent™: 21% (10 mL, 20 mL, 40 mL)

Retraction cord [impregnated with 21% solution]:

Hemodent™: Braided cord, thin (7 ft); braided cord medium thin (7 ft); twisted cord #3 (7 ft); twisted cord #9 (7ft)

Generic Available No

Mechanism of Action Precipitates tissue and blood proteins causing a mechanical obstruction to hemorrhage from injured blood vessels

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment None reported

Jump To Field (Select Field Name)

Pronunciation(a LOO mi num hye DROKS ide & mag NEE zhum KAR bun nate)

U.S. Brand NamesAcid Gone Extra Strength [OTC]; Acid Gone [OTC]; Alenic Alka [OTC]; Gaviscon® Extra Strength [OTC]; Gaviscon® Liquid [OTC]; Genaton™ [OTC]

Pharmacologic CategoryAntacid

Use: Labeled IndicationsTemporary relief of symptoms associated with gastric acidity

Dosing: AdultsDyspepsia, gastric acidity: Oral:

Liquid:

Gaviscon® Regular Strength: 15-30 mL 4 times/day after meals and at bedtime

Gaviscon® Extra Strength: 15-30 mL 4 times/day after meals

Tablet (Gaviscon® Extra Strength): Chew 2-4 tablets 4 times/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentAluminum and/or magnesium may accumulate in renal impairment.

Dietary ConsiderationsShould be taken 1-3 hours after meals with water, milk or juice. Some products contain sodium; Gaviscon® regular strength liquid: 0.57 mEq/5 mL, Gaviscon® Extra Strength liquid: 0.9 mEq/5 mL extra strength liquid, Gaviscon® Extra Strength tablet 19 mg [1.3 mEq], Alenic Alka liquid: 13 mg/5 mL

Geriatric ConsiderationsElderly, due to disease or drug therapy, may be predisposed to diarrhea or constipation. Diarrhea may result in electrolyte imbalance. Decreased renal function (Cl_{cr} <30 mL/minute) may result in toxicity of aluminum or magnesium. Drug interactions must be considered. If possible, administer antacid 1-2 hours apart from other drugs. When treating ulcers, consider buffer capacity (mEq/mL) to calculate dose of antacid.

Adverse Reactions1% to 10%:

Endocrine & metabolic: Hypermagnesemia, aluminum intoxication (prolonged use and concomitant renal failure), hypophosphatemia

Gastrointestinal: Constipation, diarrhea

Neuromuscular & skeletal: Osteomalacia

Drug Interactions

ACE Inhibitors: Antacids may decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Antacids may decrease the absorption of Allopurinol. *Risk D: Consider therapy modification*

Alpha-/Beta-Agonists: Antacids may decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Dipivefrin. *Risk C: Monitor therapy*

Amphetamines: Antacids may decrease the excretion of Amphetamines. *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): Antacids may decrease the serum concentration of Anticonvulsants (Hydantoin). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): Antacids may decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Antipsychotic Agents (Phenothiazines): Antacids may decrease the absorption of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Ascorbic Acid: May increase the absorption of Aluminum Hydroxide. *Risk D: Consider therapy modification*

Atazanavir: Antacids may decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

Bisacodyl: Antacids may diminish the therapeutic effect of Bisacodyl. Antacids may cause the delayed-release bisacodyl tablets to release drug prior to reaching the large intestine. Gastric irritation and/or cramps may occur. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Antacids may decrease the absorption of Bisphosphonate Derivatives. Antacids containing aluminum, calcium, or magnesium are of specific concern. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Cefpodoxime: Antacids may decrease the serum concentration of Cefpodoxime. *Risk C: Monitor therapy*

Cefuroxime: Antacids may decrease the serum concentration of Cefuroxime. *Risk C: Monitor therapy*

Citric Acid Derivatives: May increase the absorption of Aluminum Hydroxide. *Risk D: Consider therapy modification*

Corticosteroids (Oral): Antacids may decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

CycloSPORINE: Antacids may decrease the serum concentration of CycloSPORINE. Specifically when cyclosporine is administered orally. *Risk C:*

Monitor therapy

Dabigatran Etexilate: Antacids may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dasatinib: Antacids may decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

Deferasirox: Aluminum Hydroxide may diminish the therapeutic effect of Deferasirox. *Risk D: Consider therapy modification*

Delavirdine: Antacids may decrease the absorption of Delavirdine. *Risk D: Consider therapy modification*

Erlotinib: Antacids may decrease the serum concentration of Erlotinib. Management: Separate the administration of erlotinib and any antacid by several hours in order to minimize the risk of a significant interaction. *Risk D: Consider therapy modification*

Ethambutol: Aluminum Hydroxide may decrease the absorption of Ethambutol. *Risk D: Consider therapy modification*

Fexofenadine: Antacids may decrease the serum concentration of Fexofenadine. Management: No specific recommendations concerning the time required between their administration are provided. Separate administration of each agent by as much time as possible to decrease the risk of an interaction. *Risk D: Consider therapy modification*

Iron Salts: Antacids may decrease the absorption of Iron Salts. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Isoniazid: Antacids may decrease the absorption of Isoniazid. *Risk D: Consider therapy modification*

Methenamine: Antacids may diminish the therapeutic effect of Methenamine. *Risk D: Consider therapy modification*

Mycophenolate: Antacids may decrease the absorption of Mycophenolate. *Risk D: Consider therapy modification*

Penicillamine: Antacids may decrease the serum concentration of Penicillamine. *Risk D: Consider therapy modification*

Phosphate Supplements: Antacids may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Protease Inhibitors: Antacids may decrease the absorption of Protease Inhibitors. **Exceptions:** Darunavir. *Risk C: Monitor therapy*

QuiNIDine: Antacids may decrease the excretion of QuiNIDine. *Risk C: Monitor therapy*

Quinolone Antibiotics: Antacids may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Sodium Polystyrene Sulfonate: May enhance the adverse/toxic effect of Antacids. The combined use of these two agents may result in metabolic alkalosis. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Antacids may decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Tocainide: Antacids may increase the serum concentration of Tocainide. *Risk C: Monitor therapy*

Trientine: Antacids may decrease the absorption of Trientine. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Liquid:

Acid Gone: Aluminum hydroxide 31.7 mg and magnesium carbonate 119.3 mg per 5 mL (360 mL)

Alenic Alka: Aluminum hydroxide 31.7 mg and magnesium carbonate 119.3 mg per 5 mL (355 mL) [contains magnesium 35 mg/5 mL, sodium 13 mg/5 mL, and benzyl alcohol; cool mint flavor]

Gaviscon®: Aluminum hydroxide 31.7 mg and magnesium carbonate 119.3 mg per 5 mL (355 mL) [contains sodium 0.57 mEq/5 mL and benzyl alcohol; cool mint flavor]

Gaviscon® Extra Strength: Aluminum hydroxide 84.6 mg and magnesium carbonate 79.1 mg per 5 mL (355 mL) [contains sodium 0.9 mEq/5 mL and benzyl alcohol; cool mint flavor]

Genaton™: Aluminum hydroxide 31.7 mg and magnesium carbonate 119.3 mg per 5 mL (360 mL)

Tablet, chewable:

Acid Gone Extra Strength: Aluminum hydroxide 160 mg and magnesium carbonate 105 mg

Gaviscon® Extra Strength: Aluminum hydroxide 160 mg and magnesium carbonate 105 mg [contains sodium 19 mg/tablet (1.3 mEq/tablet); cherry and original flavors]

Generic AvailableYes

Related Information

- Aluminum Hydroxide

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Chalky taste. Aluminum and magnesium ions prevent GI absorption of tetracycline by forming a large ionized chelated molecule with the tetracyclines in the stomach. Aluminum hydroxide prevents GI absorption of ketoconazole and itraconazole by increasing the pH in the GI tract. Any of these drugs should be administered at least 1 hour before aluminum hydroxide.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Methenamine: Antacids may diminish the therapeutic effect of Methenamine. *Risk D: Consider therapy modification*

Mycophenolate: Antacids may decrease the absorption of Mycophenolate. *Risk D: Consider therapy modification*

Mycophenolate: Magnesium Salts may decrease the absorption of Mycophenolate. This only applies to oral magnesium salts. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents: Magnesium Salts may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents. Only of concern in patients with increased serum magnesium concentrations. *Risk C: Monitor therapy*

Penicillamine: Antacids may decrease the serum concentration of Penicillamine. *Risk D: Consider therapy modification*

Phosphate Supplements: Antacids may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Phosphate Supplements: Magnesium Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Protease Inhibitors: Antacids may decrease the absorption of Protease Inhibitors. **Exceptions:** Darunavir. *Risk C: Monitor therapy*

QuiNIDine: Antacids may decrease the excretion of QuiNIDine. *Risk C: Monitor therapy*

Quinolone Antibiotics: Antacids may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Quinolone Antibiotics: Magnesium Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. *Risk D: Consider therapy modification*

Sodium Polystyrene Sulfonate: May enhance the adverse/toxic effect of Antacids. The combined use of these two agents may result in metabolic alkalosis. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Antacids may decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Magnesium Salts may decrease the absorption of Tetracycline Derivatives. Only applicable to oral preparations of each agent. *Risk D: Consider therapy modification*

Tocainide: Antacids may increase the serum concentration of Tocainide. *Risk C: Monitor therapy*

Trientine: Antacids may decrease the absorption of Trientine. *Risk D: Consider therapy modification*

Trientine: May decrease the serum concentration of Magnesium Salts. Magnesium Salts may decrease the serum concentration of Trientine. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Suspension: Aluminum hydroxide 225 mg and magnesium hydroxide 200 mg per 5 mL (360 mL)

Alamag, Rulox: Aluminum hydroxide 225 mg and magnesium hydroxide 200 mg per 5 mL (360 mL)

Tablet, chewable:

Alamag: Aluminum hydroxide 300 mg and magnesium hydroxide 150 mg

Rulox No. 1: Aluminum hydroxide 200 mg and magnesium hydroxide 200 mg [DSC]

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

600-300 mg/5 mL (355): $8.99

Related Information

- Aluminum Hydroxide
- Magnesium Hydroxide

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Chalky taste. Aluminum and magnesium ions prevent GI absorption of tetracycline by forming a large ionized chelated molecule with the tetracyclines in the stomach. Aluminum hydroxide prevents GI absorption of ketoconazole and itraconazole by increasing the pH in the GI tract. Any of these drugs should be administered at least 1 hour before aluminum hydroxide.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsMagnesium Hydroxide and Aluminum Hydroxide

Pronunciation(a LOO mi num hye DROKS ide & mag NEE zhum trye SIL i kate)

U.S. Brand NamesAlenic Alka Tablet [OTC]; Gaviscon速 Tablet [OTC]; Genaton Tablet [OTC]

Pharmacologic CategoryAntacid

Use: Labeled IndicationsTemporary relief of hyperacidity

Dosing: AdultsDyspepsia, gastric acidity: Oral: Chew 2-4 tablets 4 times/day or as directed by healthcare provider

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentAluminum and/or magnesium may accumulate in renal impairment.

Administration: OralTablets should be chewed and not swallowed whole.

Dietary ConsiderationsShould be taken 1-3 hours after meals with water, milk, or juice. Gaviscon速 chewable tablet contains sodium 0.8 mEq/tablet.

Geriatric ConsiderationsElderly, due to disease or drug therapy, may be predisposed to diarrhea or constipation. Diarrhea may result in electrolyte imbalance. Decreased renal function (Cl_{cr} <30 mL/minute) may result in toxicity of aluminum or magnesium. Drug interactions must be considered. If possible, administer antacid 1-2 hours apart from other drugs. When treating ulcers, consider buffer capacity (mEq/mL) to calculate dose of antacid.

Pregnancy Risk FactorC

Drug Interactions

ACE Inhibitors: Antacids may decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Antacids may decrease the absorption of Allopurinol. *Risk D: Consider therapy modification*

Alpha-/Beta-Agonists: Antacids may decrease the excretion of Alpha-/Beta-Agonists. **Exceptions:** Dipivefrin. *Risk C: Monitor therapy*

Amphetamines: Antacids may decrease the excretion of Amphetamines. *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): Antacids may decrease the serum concentration of Anticonvulsants (Hydantoin). *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): Antacids may decrease the absorption of Antifungal Agents (Azole Derivatives, Systemic). **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Antipsychotic Agents (Phenothiazines): Antacids may decrease the absorption of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Ascorbic Acid: May increase the absorption of Aluminum Hydroxide. *Risk D: Consider therapy modification*

Atazanavir: Antacids may decrease the absorption of Atazanavir. *Risk D: Consider therapy modification*

Bisacodyl: Antacids may diminish the therapeutic effect of Bisacodyl. Antacids may cause the delayed-release bisacodyl tablets to release drug prior to reaching the large intestine. Gastric irritation and/or cramps may occur. *Risk D: Consider therapy modification*

Bisphosphonate Derivatives: Antacids may decrease the absorption of Bisphosphonate Derivatives. Antacids containing aluminum, calcium, or magnesium are of specific concern. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Cefpodoxime: Antacids may decrease the serum concentration of Cefpodoxime. *Risk C: Monitor therapy*

Cefuroxime: Antacids may decrease the serum concentration of Cefuroxime. *Risk C: Monitor therapy*

Citric Acid Derivatives: May increase the absorption of Aluminum Hydroxide. *Risk D: Consider therapy modification*

Corticosteroids (Oral): Antacids may decrease the bioavailability of Corticosteroids (Oral). *Risk D: Consider therapy modification*

CycloSPORINE: Antacids may decrease the serum concentration of CycloSPORINE. Specifically when cyclosporine is administered orally. *Risk C: Monitor therapy*

Dabigatran Etexilate: Antacids may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Dasatinib: Antacids may decrease the absorption of Dasatinib. *Risk D: Consider therapy modification*

Deferasirox: Aluminum Hydroxide may diminish the therapeutic effect of Deferasirox. *Risk D: Consider therapy modification*

Delavirdine: Antacids may decrease the absorption of Delavirdine. *Risk D: Consider therapy modification*

Erlotinib: Antacids may decrease the serum concentration of Erlotinib. Management: Separate the administration of erlotinib and any antacid by several hours in order to minimize the risk of a significant interaction. *Risk D: Consider therapy modification*

Ethambutol: Aluminum Hydroxide may decrease the absorption of Ethambutol. *Risk D: Consider therapy modification*

Fexofenadine: Antacids may decrease the serum concentration of Fexofenadine. Management: No specific recommendations concerning the time required between their administration are provided. Separate administration of each agent by as much time as possible to decrease the risk of an interaction. *Risk D: Consider therapy modification*

Iron Salts: Antacids may decrease the absorption of Iron Salts. **Exceptions:** Ferric Gluconate; Iron Dextran Complex; Iron Sucrose. *Risk D: Consider therapy modification*

Isoniazid: Antacids may decrease the absorption of Isoniazid. *Risk D: Consider therapy modification*

Methenamine: Antacids may diminish the therapeutic effect of Methenamine. *Risk D: Consider therapy modification*

Mycophenolate: Antacids may decrease the absorption of Mycophenolate. *Risk D: Consider therapy modification*

Penicillamine: Antacids may decrease the serum concentration of Penicillamine. *Risk D: Consider therapy modification*

Phosphate Supplements: Antacids may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Protease Inhibitors: Antacids may decrease the absorption of Protease Inhibitors. **Exceptions:** Darunavir. *Risk C: Monitor therapy*

QuiNIDine: Antacids may decrease the excretion of QuiNIDine. *Risk C: Monitor therapy*

Quinolone Antibiotics: Antacids may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of quinolones. *Risk D: Consider therapy modification*

Sodium Polystyrene Sulfonate: May enhance the adverse/toxic effect of Antacids. The combined use of these two agents may result in metabolic alkalosis. *Risk D: Consider therapy modification*

Tetracycline Derivatives: Antacids may decrease the absorption of Tetracycline Derivatives. *Risk D: Consider therapy modification*

Tocainide: Antacids may increase the serum concentration of Tocainide. *Risk C: Monitor therapy*

Trientine: Antacids may decrease the absorption of Trientine. *Risk D: Consider therapy modification*

Jump To Field (Select Field Name)

Pronunciation(a LOO mi num hye DROKS ide)
U.S. Brand NamesALternaGel® [OTC]; Dermagran® [OTC]
Canadian Brand NamesAmphojel®; Basaljel®
Pharmacologic CategoryAntacid; Antidote; Protectant, Topical
Use: Labeled IndicationsTreatment of hyperacidity; hyperphosphatemia; temporary protection of minor cuts, scrapes, and burns
Dosing: Adults

Hyperphosphatemia: Oral: Initial: 300-600 mg 3 times/day with meals

Hyperacidity: Oral: 600-1200 mg between meals and at bedtime

Skin protectant: Topical: Apply to affected area as needed; reapply at least every 12 hours

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric
Hyperphosphatemia: Oral: 50-150 mg/kg/24 hours in divided doses every 4-6 hours, titrate dosage to maintain serum phosphorus within normal range

Skin protectant: Topical: Refer to adult dosing.

Dosing: Renal ImpairmentAluminum may accumulate in renal impairment.
Administration: OralDose should be followed with water.
Administration: TopicalApply as needed to affected area; reapply at least every 12 hours.
Dietary ConsiderationsShould be taken 1-3 hours after meals when used as an antacid. When used to decrease phosphorus, should be taken within 20 minutes of a meal.
ContraindicationsHypersensitivity to aluminum salts or any component of the formulation
Warnings/Precautions

Dosage form specific issues:

- Oral: Hypophosphatemia may occur with prolonged administration or large doses; aluminum intoxication and osteomalacia may occur in patients with uremia. Use with caution in patients with HF, renal failure, edema, cirrhosis, and low sodium diets, and patients who have recently suffered gastrointestinal hemorrhage; uremic patients not receiving dialysis may develop osteomalacia and osteoporosis due to phosphate depletion. When used as an antacid in ulcer treatment, consider buffer capacity (mEq/mL) to calculate dose. Elderly may be predisposed to constipation and fecal impaction. Careful evaluation of possible drug interactions must be done.

- Topical: Not for application over deep wounds, puncture wounds, infected areas, or lacerations. When used for self medication (OTC use), consult with healthcare provider if needed for >7 days or for use in children <6 months of age.

Geriatric ConsiderationsElderly, due to disease and/or drug therapy, may be predisposed to constipation and fecal impaction. Careful evaluation of possible drug interactions must be done. When used as an antacid in ulcer treatment, consider buffer capacity (mEq/mL) to calculate dose. Consider renal insufficiency (<30 mL/minute) as predisposition to aluminum toxicity.
Pregnancy Risk FactorC
Pregnancy ConsiderationsNo data available on clinical effects on the fetus; available evidence suggests safe use during pregnancy and breast-feeding.
LactationExcretion in breast milk unknown
Adverse ReactionsFrequency not defined.

Gastrointestinal: Constipation, stomach cramps, fecal impaction, nausea, vomiting, discoloration of feces (white speckles)

Endocrine & metabolic: Hypophosphatemia, hypomagnesemia

Drug Interactions

ACE Inhibitors: Antacids may decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Antacids may decrease the absorption of Allopurinol. *Risk D: Consider therapy modification*

Amphetamines: Antacids may decrease the excretion of Amphetamines. *Risk C: Monitor therapy*

Anticonvulsants (Hydantoin): Antacids may decrease the serum concentration of Anticonvulsants (Hydantoin). *Risk C: Monitor therapy*

Trientine: Antacids may decrease the absorption of Trientine. *Risk D: Consider therapy modification*

Test InteractionsDecreased phosphorus, inorganic (S)

Monitoring ParametersMonitor phosphorus levels periodically when patient is on chronic therapy.

Nursing: Physical Assessment/MonitoringAssess results of laboratory tests and therapeutic effectiveness. Assess for constipation and treat accordingly.

Monitoring: Lab TestsMonitor calcium and phosphate levels periodically when patient is on chronic therapy.

Patient EducationTake as directed, preferably 1-3 hours after meals (when used as an antacid) or with any other medications. When used to decrease phosphorus, take within 20 minutes of a meal. Do not increase sodium intake and maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. You may experience constipation (increased exercise, fluids, fruit, or fiber may help; if unresolved, contact prescriber). Report unresolved nausea, malaise, muscle weakness, blood in stool or black stool, or abdominal pain. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Ointment:

Dermagran®: 0.275% (120 g)

Suspension, oral: 320 mg/5 mL (473 mL)

ALternaGel®: 600 mg/5 mL (360 mL)

Generic AvailableYes: Suspension

Mechanism of ActionNeutralizes hydrochloride in stomach to form $Al(Cl)_3$ salt + H_2O

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Chalky taste. Aluminum and magnesium ions prevent GI absorption of tetracycline by forming a large ionized chelated molecule with the aluminum ion and tetracyclines in the stomach. Aluminum hydroxide prevents GI absorption of ketoconazole and itraconazole by increasing the pH in the GI tract. Any of these drugs should be administered at least 1 hour before $Al(OH)_3$.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentConstipation is common and may be additive when used with psychotropics; may decrease the absorption of benzodiazepines and phenothiazines

Jump To Field (Select Field Name)

Pronunciation(a LOO mi num SUL fate & KAL see um AS e tate)

U.S. Brand NamesDomeboro® [OTC]; Gordon Boro-Packs [OTC]; Pedi-Boro® [OTC]

Pharmacologic CategoryTopical Skin Product

Use: Labeled IndicationsAstringent wet dressing for relief of inflammatory conditions of the skin; reduce weeping that may occur in dermatitis

Dosing: AdultsDermal inflammation, dermatitis: Topical: Soak affected area in the solution 2-4 times/day for 15-30 minutes or apply wet dressing soaked in the solution for more extended periods; rewet dressing with solution 2-4 times/day every 15-30 minutes

Dosing: ElderlyRefer to adult dosing.

StoragePrior to mixing, store powder or tablets at controlled room temperature, 15°C to 30°C (59°F to 86°F). Following reconstitution, unused solution may be covered and stored at room temperature for up to 7 days.

Reconstitution

Powder, for topical solution (Domeboro®, Pedi-Boro®): 1 packet/16 ounces of water = 1:40 dilution = Modified Burow's Solution

Tablet, effervescent, for topical solution (Domeboro®): 1 tablet/12 ounces of water = 1:40 dilution = Modified Burow's Solution

Warnings/Precautions

Other warnings/precautions:

- Appropriate use: For external use only; avoid contact with eyes. Discontinue use if irritation occurs.
- OTC duration of therapy: Not for OTC use >7 days.

Geriatric ConsiderationsNo special considerations necessary

Drug Interactions

Bisphosphonate Derivatives: Calcium Salts may decrease the absorption of Bisphosphonate Derivatives. **Exceptions:** Pamidronate; Zoledronic Acid. *Risk D: Consider therapy modification*

Calcium Channel Blockers: Calcium Salts may diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

CefTRIAXone: Calcium Salts (Intravenous) may enhance the adverse/toxic effect of CefTRIAXone. Ceftriaxone binds to calcium forming an insoluble precipitate. *Risk X: Avoid combination*

DOBUTamine: Calcium Salts may diminish the therapeutic effect of DOBUTamine. *Risk C: Monitor therapy*

Estramustine: Calcium Salts may decrease the absorption of Estramustine. *Risk D: Consider therapy modification*

Phosphate Supplements: Calcium Salts may decrease the absorption of Phosphate Supplements. *Risk D: Consider therapy modification*

Quinolone Antibiotics: Calcium Salts may decrease the absorption of Quinolone Antibiotics. Of concern only with oral administration of both agents. **Exceptions:** Moxifloxacin. *Risk D: Consider therapy modification*

Thiazide Diuretics: May decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Trientine: Calcium Salts may decrease the serum concentration of Trientine. Trientine may decrease the serum concentration of Calcium Salts. *Risk D: Consider therapy modification*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Powder, for topical solution:

Domeboro®: Aluminum sulfate 1191 mg and calcium acetate 839 mg per packet (12s, 100s)

Alvimopan

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Alvimopan may be confused with almotriptan

Pronunciation(al vi MOE pan)

U.S. Brand NamesEntereg®

Pharmacologic CategoryGastrointestinal Agent, Miscellaneous; Opioid Antagonist, Peripherally-Acting

Use: Labeled IndicationsAccelerate the time to upper and lower GI recovery following partial large or small bowel resection surgery with primary anastomosis

Dosing: Adults**Note:** For hospital use only.

Management of postoperative ileus: Oral:

Initial: 12 mg administered 30 minutes to 5 hours prior to surgery

Maintenance: 12 mg twice daily beginning the day after surgery for a maximum of 7 days or until discharged from hospital (maximum total treatment doses: 15 doses)

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Mild-to-severe impairment: No adjustment needed; use caution.

ESRD: Use not recommended.

Dosing: Hepatic Impairment

Mild-to-moderate impairment (Child-Pugh class A and B): No adjustment needed; use caution.

Severe impairment (Child-Pugh class C): Use not recommended.

Administration: OralPatient must be hospitalized. Initial dose should be administered 30 minutes to 5 hours prior to surgery.

Dietary ConsiderationsTake with or without food; high-fat meals may decrease the rate and extent of absorption

StorageStore at controlled room temperature of 25°C (77°F).

RestrictionsOnly hospitals enrolled in the ENTEREG Access Support and Education (E.A.S.E.™) Program may administer this medication. Hospital staff must be educated on need to limit to short-term (no more than 15 doses) and inpatient use. Hospitals may contact the E.A.S.E.™ program at 1-866-423-6567 (1-866-4ADOLOR).

ContraindicationsPatients who have taken therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan

Warnings/Precautions

Boxed warnings:

- Appropriate use: See "Other warnings/precautions" below.

Concerns related to adverse effects:

- Cardiovascular effects: A trend towards an increased incidence of MI was observed in alvimopan (low dose) treated patients compared to placebo in a 12-month study in patients treated with opioids for chronic pain. MI was generally observed more frequently in the initial 1-4 months of treatment. Other studies have not observed this trend and a causal relationship has not been found.

Disease-related concerns:

- Complete bowel obstruction: Use not recommended in patients undergoing surgery for complete bowel obstruction.

- Hepatic impairment: Use with caution in patients with mild-to-moderate hepatic impairment (Child-Pugh classes A and B); use not recommended with severe impairment (Child-Pugh class C).

- Renal impairment: Use with caution in patients with renal impairment; use not recommended in patients with ESRD.

Concurrent drug therapy issues:

- Opioids: Use with caution in patients recently exposed to opioids; may be more sensitive to gastrointestinal adverse effects (eg, abdominal pain, diarrhea, nausea and vomiting). Contraindicated in patients who have received therapeutic opioids for >7 consecutive days immediately prior to use.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: **[U.S. Boxed Warning]: For short-term (≤15 doses) hospital use only. Only hospitals that have registered through the ENTEREG Access Support and Education (E.A.S.E.™) Program and met all requirements may use.** It will not be dispensed to patients who have been discharged from the hospital.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAnimal studies have not shown teratogenic effects to the fetus. However, there are no adequate and well-controlled studies in pregnant women; use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions**Note:** Incidence reported limited to bowel resection patients only. 1% to 10%:

Endocrine & metabolic: Hypokalemia (10%)

Gastrointestinal: Dyspepsia (7%)

Genitourinary: Urinary retention (3%)

Hematologic: Anemia (5%)

Neuromuscular & skeletal: Back pain (3%)

Metabolism/Transport Effects**Substrate** of P-glycoprotein

Drug Interactions

Analgesics (Opioid): May enhance the adverse/toxic effect of Alvimopan. This is most notable for patients receiving long-term (i.e., more than 7 days) opiates prior to alvimopan initiation. Management: Alvimopan is contraindicated in patients receiving therapeutic doses of opioids for more than 7 consecutive days immediately prior to alvimopan initiation. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: When administered with a high-fat meal, extent and rate of absorption may be reduced (C_{max} and AUC decreased by ~38% and 21%, respectively).

Nursing: Physical Assessment/MonitoringFor restricted in-hospital use only. See administration specifics. Teach patient possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationThis medication is used to improve bowel function after surgery. Report any gastrointestinal upset, difficulty passing urine, unusual back pain, or other adverse reactions. **Breast-feeding precautions:** Inform prescriber if you are or intend to breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Entereg®: 12 mg

Generic AvailableNo

ManufacturerAdolor Corporation

Mechanism of ActionAn opioid receptor antagonist which blocks opioid binding at the mu receptor; alvimopan has restricted ability to cross the blood-brain barrier at therapeutic doses. It selectively and competitively binds to the GI tract mu opioid receptors and antagonizes the peripheral effects of opioids on gastrointestinal motility and secretion. Does not affect opioid analgesic effects or induce opioid withdrawal symptoms.

Pharmacodynamics/Kinetics

Distribution: V_d: 20-40 L

Protein binding: Parent drug: 80%; metabolite: 94% (both primarily to albumin)

Metabolism: Hydrolyzed to an amide hydrolysis compound (active metabolite) by gut microflora; further metabolism of active metabolite to glucuronide conjugates and other minor metabolites.

Bioavailability: ~6% (range: 1% to 19%)

Half-life elimination: 10-18 hours

Time to peak, plasma: ~2 hours

Excretion: Urine (35% as unchanged drug and metabolites); feces (via biliary excretion)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentContraindicated in patients who have taken therapeutic doses of opioids for more than 7 consecutive days immediately prior to use.

Index TermsADL-2698; LY246736

Special Alerts

Amantadine ACIP 2008-2009 Influenza Guidelines (July 2008)

The Advisory Committee on Immunization Practices (ACIP), as part of their recommendations for the Prevention and Control of Influenza, do not recommend the use of amantadine or rimantadine for the treatment or chemoprophylaxis of influenza A infection. This recommendation is for the 2008-2009 season for residents of the United States and is based on current patterns of resistance to these medications. Oseltamivir or zanamivir are the recommended antiviral agents. In some areas, resistance is developing against oseltamivir. If resistance is suspected, amantadine or rimantadine may be used in combination with oseltamivir for the treatment or prophylaxis of influenza A infection when zanamivir therapy is not indicated (such as in children of certain ages).

For additional information, refer to the ACIP guidelines on the following CDC website: http://www.cdc.gov/mmwr/preview/mmwrhtml/rr57e717a1.htm

Medication Safety Issues

Sound-alike/look-alike issues:

Amantadine may be confused with ranitidine, rimantadine

Symmetrel® may be confused with Synthroid®

International issues:

Symmetrel® may be confused with Somatrel® which is a brand name for somatorelin in Denmark

Pronunciation(a MAN ta deen)
U.S. Brand NamesSymmetrel®
Canadian Brand NamesEndantadine®; PMS-Amantadine; Symmetrel®
Pharmacologic CategoryAnti-Parkinson's Agent, Dopamine Agonist; Antiviral Agent, Adamantane
Use: Labeled IndicationsProphylaxis and treatment of influenza A viral infection (per manufacturer labeling; also refer to current ACIP guidelines for recommendations during current flu season); treatment of parkinsonism; treatment of drug-induced extrapyramidal symptoms

Note: In certain circumstances, the ACIP recommends use of amantadine in combination with oseltamivir for the treatment or prophylaxis of influenza A infection when resistance to oseltamivir is suspected.

Dosing: Adults

Influenza A treatment: Oral: 100 mg twice daily; initiate within 24-48 hours after onset of symptoms; discontinue as soon as possible based on clinical response (generally within 3-5 days or within 24-48 hours after symptoms disappear).

Influenza A prophylaxis: Oral: 100 mg twice daily; continue treatment throughout the peak influenza activity in the community or throughout the entire influenza season in patients who cannot be vaccinated. Development of immunity following vaccination takes ~2 weeks; amantadine therapy should be considered for high-risk patients from the time of vaccination until immunity has developed.

Drug-induced extrapyramidal symptoms: Oral: 100 mg twice daily; may increase to 300-400 mg/day, if needed

Parkinson's disease or Creutzfeldt-Jakob disease (unlabeled use): Oral: 100 mg twice daily as sole therapy; may increase to 400 mg/day if needed with close monitoring; initial dose: 100 mg/day if with other serious illness or with high doses of other anti-Parkinson drugs

Dosing: ElderlyAdjust dose based on renal function; some patients tolerate the drug better when it is given in 2 divided daily doses (to avoid adverse neurologic reactions).
Influenza A prophylaxis or treatment: ≤100 mg/day in patients ≥65 years

Dosing: Pediatric

Influenza A treatment: Oral: **Note:** Initiate within 24-48 hours after onset of symptoms; discontinue as soon as possible based on clinical response (generally within 3-5 days or within 24-48 hours after symptoms disappear)

1-9 years: 5 mg/kg/day in 2 divided doses (manufacturers range: 4.4-8.8 mg/kg/day); maximum dose: 150 mg/day

≥10 years and <40 kg: 5 mg/kg/day; maximum dose: 150 mg/day

≥10 years and ≥40 kg: Refer to adult dosing.

Influenza A prophylaxis: Oral: Refer to “Influenza A treatment” dosing. Continue treatment throughout the peak influenza activity in the community or throughout the entire influenza season in patients who cannot be vaccinated. Development of immunity following vaccination takes ~2 weeks; amantadine therapy should be considered for high-risk patients from the time of vaccination until immunity has developed. For children <9 years receiving influenza vaccine for the first time, amantadine prophylaxis should continue for 6 weeks (4 weeks after the first dose and 2 weeks after the second dose)

Dosing: Renal Impairment

Cl_{cr} 30-50 mL/minute: Administer 200 mg on day 1, then 100 mg/day

Cl_{cr} 15-29 mL/minute: Administer 200 mg on day 1, then 100 mg on alternate days

Cl_{cr} <15 mL/minute: Administer 200 mg every 7 days

Hemodialysis: Administer 200 mg every 7 days

Peritoneal dialysis: No supplemental dose is needed

Continuous arteriovenous or venous-venous hemofiltration: No supplemental dose is needed

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

StorageStore at 25°C (77°F).

ContraindicationsHypersensitivity to amantadine, rimantadine, or any component of the formulation

Allergy Considerations

- Adamantane Derivative Allergy

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).

- Impulsive control disorders: Dopamine agonists used for Parkinson’s disease or restless legs syndrome have been associated with compulsive behaviors and/or loss of impulse control, which has manifested as pathological gambling, libido increases (hypersexuality), and/or binge eating. Causality has not been established, and controversy exists as to whether this phenomenon is related to the underlying disease, prior behaviors/addictions and/or drug therapy. Dose reduction or discontinuation of therapy has been reported to reverse these behaviors in some, but not all cases.

- Neuroleptic malignant syndrome: Has been associated with neuroleptic malignant syndrome (associated with dose reduction or abrupt discontinuation).

- Suicidal ideation: There have been reports of suicidal ideation/attempt in patients with and without a history of psychiatric illness. May exacerbate mental problems in patients with a history of mental illness.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with heart failure, peripheral edema, or orthostatic hypotension.

- Eczema: Use with caution in patients with a history of recurrent and eczematoid dermatitis.

- Glaucoma: Avoid in untreated angle closure glaucoma.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Influenza A: Appropriate use: Consult current guidelines. Due to increased resistance, the ACIP has recommended that rimantadine and amantadine no longer be used for the treatment or prophylaxis of influenza A in the United States until susceptibility has been re-established.

- Parkinson's disease: Appropriate use: When treating Parkinson's disease, do not discontinue abruptly. In many patients, the therapeutic benefits of amantadine are limited to a few months.

- Psychosis: Use with caution in patients with uncontrolled psychosis or severe psychoneurosis.

- Renal impairment: Use with caution in patients with renal impairment; dosage reduction recommended.

- Seizure disorder: Use with caution in patients with a history of seizure disorder.

Concurrent drug therapy issues:

- CNS stimulants: Use with caution in patients receiving CNS stimulant drugs.

Special populations:

- Elderly: Use with caution in the elderly; may be more susceptible to CNS effects (using 2 divided daily doses may minimize this effect).

- Pediatrics: Safety and efficacy have not been established in children <1 year of age.

Geriatric ConsiderationsElderly patients may be more susceptible to the CNS effects of amantadine; using 2 divided daily doses may minimize this effect. The syrup may be used to administer doses <100 mg; studies have demonstrated that young adults on 200 mg/day achieve a plasma concentration of 300 ng/mL. To achieve this concentration (for influenza prophylaxis) in elderly, studies have suggested a dose of 100 mg or 1.4 mg/kg/day.
Pregnancy Risk FactorC
Pregnancy ConsiderationsTeratogenic effects were observed in animal studies; limited data in humans. Impaired fertility has also been reported during animal studies and during human *in vitro* fertilization.
LactationEnters breast milk/not recommended
Adverse Reactions

1% to 10%:

Cardiovascular: Orthostatic hypotension, peripheral edema

Central nervous system: Agitation, anxiety, ataxia, confusion, delirium, depression, dizziness, dream abnormality, fatigue, hallucinations, headache, insomnia, irritability, nervousness, somnolence

Dermatologic: Livedo reticularis

Gastrointestinal: Anorexia, constipation, diarrhea, nausea, xerostomia

Respiratory: Dry nose

<1%: Amnesia, CHF, dyspnea, eczematoid dermatitis, euphoria, hyperkinesis, hypertension, leukopenia, libido decreased, neutropenia, oculogyric episodes, photosensitivity, psychosis, rash, seizure, slurred speech, urinary retention, visual disturbances, vomiting, weakness; withdrawal reactions may include delirium, hallucinations, and psychosis

Postmarketing and/or case reports: Aggressive behavior, agranulocytosis, alkaline phosphatase increased, allergic reaction, ALT increased, AST increased, anaphylaxis, arrhythmia, bilirubin increased, BUN increased, cardiac arrest, coma, CPK increased, creatinine increased, delirium, delusions, diaphoresis, dysphagia, EEG changes, gait abnormal, GGT increased, hypertonia, hypokinesia, hypotension, keratitis, LDH increased, leukocytosis, mania, muscle contractions (involuntary), mydriasis, neuroleptic malignant syndrome (NMS; associated with dosage reduction or abrupt withdrawal of amantadine), paranoia, paresthesia, pruritus, pulmonary edema, respiratory failure (acute), stupor, suicidal ideation, suicide, tachycardia, tachypnea, tremor

Reported with dopamine agonists: Impulsive/compulsive behaviors (eg, pathological gambling, hypersexuality, binge eating)

Drug Interactions

Antipsychotics (Atypical): May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Antipsychotics (Typical): May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Influenza Virus Vaccine: Antiviral Agents (Influenza A and B) may diminish the therapeutic effect of Influenza Virus Vaccine. This only pertains to live, attentuated influenza virus vaccine. *Risk D: Consider therapy modification*

Metoclopramide: May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS adverse effects).
Monitoring ParametersRenal function, Parkinson's symptoms, mental status, influenza symptoms, blood pressure
Nursing: Physical Assessment/MonitoringAssess effectiveness and interactions of other medications patient may be taking. Monitor renal function, therapeutic effectiveness, and adverse reactions at beginning of therapy and periodically throughout therapy. Assess blood pressure; monitor for signs of fluid retention. When treating Parkinson's disease, taper slowly when discontinuing. Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.
Monitoring: Lab TestsRenal function
Patient EducationTake as directed; do not increase dosage, take more often than prescribed, or discontinue medication without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake and void before taking medication. Take last dose of day in the afternoon to reduce incidence of insomnia. Avoid getting up suddenly from a sitting or lying position; may cause dizziness or lightheadedness. Avoid alcohol, sedatives, or hypnotics unless consulting prescriber. You may experience decreased mental alertness or coordination (use caution when driving, climbing stairs, or engaging in tasks requiring alertness until response to drug is known); loss of impulse control (possibly manifested as pathological gambling, libido increases, and/or binge eating); or nausea or dry mouth (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report unusual swelling of extremities, respiratory difficulty or shortness of breath, change in vision, change in gait or increased tremors, suicide ideation, or changes in mentation (eg, depression, anxiety, irritability, hallucination, slurred speech). **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Breast-feeding is not recommended.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule, as hydrochloride: 100 mg

Capsule, softgel, as hydrochloride: 100 mg

Solution, oral, as hydrochloride: 50 mg/5 mL (473 mL)

Syrup, oral, as hydrochloride: 50 mg/5 mL (10 mL, 480 mL)

Tablet, as hydrochloride: 100 mg

Symmetrel®: 100 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Amantadine HCl)

100 mg (30): $21.99

Syrup (Amantadine HCl)

50 mg/5 mL (120): $15.98

Syrup (Symmetrel)

50 mg/5 mL (120): $37.00

Tablets (Amantadine HCl)

100 mg (30): $33.99

Mechanism of ActionAs an antiviral, blocks the uncoating of influenza A virus preventing penetration of virus into host; antiparkinsonian activity may be due to its blocking the reuptake of dopamine into presynaptic neurons or by increasing dopamine release from presynaptic fibers

Pharmacodynamics/Kinetics

Onset of action: Antidyskinetic: Within 48 hours

Absorption: Well absorbed

Distribution: V_d: Normal: 1.5-6.1 L/kg; Renal failure: 5.1 ± 0.2 L/kg; in saliva, tear film, and nasal secretions; in animals, tissue (especially lung) concentrations higher than serum concentrations; crosses blood-brain barrier

Protein binding: Normal renal function: ~67%; Hemodialysis: ~59%

Metabolism: Not appreciable; small amounts of an acetyl metabolite identified

Bioavailability: 86% to 90%

Half-life elimination: Normal renal function: 16 ± 6 hours (9-31 hours); End-stage renal disease: 7-10 days

Excretion: Urine (80% to 90% unchanged) by glomerular filtration and tubular secretion

Total clearance: 2.5-10.5 L/hour

Pharmacotherapy PearlsPatients with intolerable CNS side effects often do better with rimantadine.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (prolonged use may cause significant xerostomia; normal salivary flow resumes upon discontinuation) and orthostatic hypotension.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health CommentThis agent should not be used for an acute dystonic reaction. No injectable dosage form is available. Amantadine is generally considered to be less effective than anticholinergic antiparkinsonian agents and beta-blockers for the management of akathisia. It is effective for pseudoparkinsonism, but long-term efficacy has not been established. Given its high cost relative to anticholinergics, it is usually reserved for second-line therapy. Tolerance has also been reported to occur with long-term use (Zubenko GS, 1984). However, it does not impair cognition by adding anticholinergic load. Amantadine should not be abruptly discontinued; doing so may precipitate a parkinsonian crisis. Additionally, agitation, delirium, delusions, hallucinations, paranoia, stupor, anxiety, depression, and slurred speech may be seen if it is abruptly stopped.

Zubenko GS, Barreira P, and Lipinski JF Jr, “Development of Tolerance to the Therapeutic Effect of Amantadine on Akathisia,” *J Clin Psychopharmacol*, 1984, 4(4):218-20.

Ambenonium

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(am be NOE nee um)

U.S. Brand NamesMytelase®

Canadian Brand NamesMytelase®

Pharmacologic CategoryCholinergic Agonist

Use: Labeled IndicationsTreatment of myasthenia gravis

Dosing: AdultsMyasthenia gravis: Oral: 5-25 mg 3-4 times/day

Dosing: ElderlyRefer to adult dosing.

ContraindicationsRoutine administration of atropine or other belladonna alkaloids with ambenonium is contraindicated because they may suppress the muscarinic symptoms of excessive gastrointestinal stimulation, leaving only the more serious symptoms of muscle fasciculations and paralysis as signs of overdosage; should not be administered to patients receiving mecamylamine

Warnings/Precautions

Concerns related to adverse effects:

- Anticholinergic insensitivity: May develop for brief or prolonged periods; reduce or withhold dosages until the patient becomes sensitive again. May require respiratory support.

Disease-related concerns:

- Asthma: Use with caution in patients with asthma.
- Bradycardia: Use with caution in patients with bradycardia.
- Hyperthyroidism: Use with caution in patients with hyperthyroidism.
- Parkinson's disease: Use with caution in patients with Parkinson's disease.
- Peptic ulcer disease: Use with caution in patients with peptic ulcer disease.
- Seizures: Use with caution in patients with a history of seizures.
- Urinary tract obstruction: Use with caution in patients with urinary obstruction.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Differentiation of cholinergic/myasthenia crisis is critical; use edrophonium and clinical judgment. Prolonged action after cholinergics; drug should be discontinued until the patient is stabilized.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmias (especially bradycardia), hypotension, carbon monoxide decreased, tachycardia, AV block, nodal rhythm, ECG changes (nonspecific), cardiac arrest, syncope, flushing

Central nervous system: Convulsions, dysarthria, dysphonia, dizziness, loss of consciousness, drowsiness, headache

Dermatologic: Skin rash, thrombophlebitis (I.V.), urticaria

Gastrointestinal: Hyperperistalsis, nausea, vomiting, salivation, diarrhea, stomach cramps, dysphagia, flatulence

Genitourinary: Urinary urgency

Neuromuscular & skeletal: Weakness, fasciculations, muscle cramps, spasms, arthralgia

Ocular: Small pupils, lacrimation

Respiratory: Bronchial secretions increased, laryngospasm, bronchiolar constriction, respiratory muscle paralysis, dyspnea, respiratory depression, respiratory arrest, bronchospasm

Miscellaneous: Diaphoresis increased, anaphylaxis, allergic reactions

Drug Interactions

Acetylcholinesterase Inhibitors: May enhance the adverse/toxic effect of Cholinergic Agonists. *Risk C: Monitor therapy*

Nursing: Physical Assessment/MonitoringAssess bladder and sphincter adequacy prior to administering medication. Assess other medications patient may be taking for effectiveness and interactions. Monitor therapeutic effectiveness and adverse reactions (cholinergic crisis). Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationThis drug will not cure myasthenia gravis, but it may reduce the symptoms. Use as directed; do not increase dose or discontinue medication without consulting prescriber. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause dizziness, drowsiness, or postural hypotension (rise slowly from sitting or lying position and use caution when driving or climbing stairs); vomiting or loss of appetite (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or diarrhea (boiled milk, yogurt, or buttermilk may help). Report persistent abdominal discomfort; significantly increased salivation, sweating, tearing, or urination; flushed skin; chest pain or palpitations; acute headache; unresolved diarrhea; excessive fatigue, insomnia, dizziness, or depression; increased muscle, joint, or body pain; vision changes or blurred vision; or shortness of breath or wheezing. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(am bri SEN tan)

U.S. Brand NamesLetairis™

Canadian Brand NamesVolibris™

Pharmacologic CategoryEndothelin Antagonist; Vasodilator

Use: Labeled IndicationsTreatment of pulmonary artery hypertension (PAH) World Health Organization (WHO) Group I in patients with WHO Class II or III symptoms to improve exercise capacity and decrease the rate of clinical deterioration

Dosing: AdultsPulmonary arterial hypertension: Oral: Initial: 5 mg once daily; if tolerated, may increase to maximum 10 mg once daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo dosage adjustment is required in mild-to-moderate renal impairment. No data available for use in severe renal impairment.

Dosing: Hepatic ImpairmentAvoid use in patients with moderate-to-severe hepatic insufficiency. Dose reductions may be required in patients with mild hepatic insufficiency.

Dosing: Adjustment for ToxicityModifications based on transaminase elevation:

If any elevation, regardless of degree, is accompanied by clinical symptoms of hepatic injury (unusual fatigue, nausea, vomiting, abdominal pain, fever, or jaundice) or a serum bilirubin >2 times ULN, treatment should be stopped and not reintroduced.

AST/ALT >3 but ≤5 times ULN: Confirm with additional test; if confirmed, reduce dose or interrupt treatment. Monitor transaminase levels at least every 2 weeks until levels are <3 times ULN. Reinitiate treatment as appropriate with return to pretreatment values and with more frequent checks of transaminase levels.

AST/ALT >5 but ≤8 times ULN: Confirm with additional test; if confirmed, stop treatment. Monitor transaminase levels until they are <3 times ULN. May reintroduce treatment, as appropriate, at starting dose, following return to pretreatment values. More frequent checks of transaminase levels are required after resuming therapy.

AST/ALT >8 times ULN: Stop treatment and do not reintroduce.

Administration: OralSwallow tablet whole. Do not split, crush, or chew tablets. May be administered with or without food.

Dietary ConsiderationsMay be taken with or without food. Avoid grapefruit and grapefruit juice.

StorageStore at controlled room temperature of 25°C (77°F).

Restrictions

Ambrisentan (Letairis™) is only available through the limited distribution program (Letairis Education and Access Program [LEAP]). Only prescribers and pharmacies registered with LEAP may prescribe and dispense ambrisentan. Further information may be obtained from the manufacturer, Gilead Sciences, Inc (1-866-664-5327). FDA-approved medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsPregnancy

Canadian labeling: Additional contraindications (not in U.S. labeling): Hypersensitivity to ambrisentan or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Hepatic impairment: See “Disease-related concerns” below
- Pregnancy: See “Special populations” below

Concerns related to adverse effects:

- Fluid retention/peripheral edema: Development of peripheral edema due to treatment and/or disease state (pulmonary arterial hypertension) may occur; a higher incidence is seen in elderly patients. There have also been postmarketing reports of fluid retention requiring treatment (eg, diuretics, fluid management, hospitalization). Further evaluation may be necessary to determine cause and appropriate treatment or discontinuation of therapy.
- Hematologic changes: A reduction in hematocrit/hemoglobin may be observed within the first few weeks of therapy with subsequent stabilization of levels. Hemoglobin reductions >15% have been observed in some patients. Measure hemoglobin prior to initiating therapy, at 1 month, and periodically thereafter. Significant decreases in hemoglobin in the absence of other causes may warrant the discontinuation of therapy.

Disease-related concerns:

- Hepatic impairment: **[U.S. Boxed Warning]: Avoid use in moderate-to-severe hepatic impairment.** Has been associated with significant transaminase (ALT or AST) elevations (>3 times upper limit of normal [ULN]) in up to 3% of treated patients. Transaminase elevations are dose dependent. Avoid use in patients with elevated serum transaminases (>3 times ULN) at baseline. An increase in bilirubin may be observed as well. Monitor hepatic function closely (at least monthly) for the duration of treatment. Reduce dose or interrupt therapy if transaminases >3 times ULN and ≤5 times ULN and discontinue therapy with levels >5 times ULN and ≤8 times ULN. Treatment should be stopped in patients who develop elevated transaminases >8 times ULN, elevated transaminases accompanied by symptoms of hepatic injury (unusual fatigue, jaundice, nausea, vomiting, abdominal pain, and/or fever) or elevated serum bilirubin >2 times ULN. Safety of reintroduction is unknown. Use caution in mild hepatic impairment. Dose reduction may be necessary.

Concurrent drug therapy issues:

- High potential for interactions: Use caution in patients taking strong inhibitors or inducers of CYP3A4 or CYP2C19, inhibitors of P-glycoprotein (eg, cyclosporine), or agents which affect glucuronidation metabolism via uridine 5'-diphosphate glucuronosyltransferase (UGT) enzymes.

Special populations:

- Pediatrics: Safety and efficacy have not been established in patients <18 years of age.
- Pregnancy: **[U.S. Boxed Warning]: Use in pregnancy is contraindicated.** Exclude pregnancy prior to initiating therapy and monthly thereafter during therapy. Two reliable methods of contraception must be used during therapy except in patients with tubal ligation or an implanted IUD (Copper T 380A or LNg 20). No other contraceptive measures are required for these patients. A missed menses should be reported to healthcare provider and prompt immediate pregnancy testing.

Pregnancy Risk FactorX

Pregnancy Considerations**[U.S. Boxed Warning]: Use in pregnancy is contraindicated.** Based on animal studies, ambrisentan is likely to produce major birth defects if used by pregnant women. Pregnancy must be excluded prior to initiation of therapy and follow-up pregnancy tests should be obtained monthly. Two reliable methods of contraception must be used throughout treatment unless the patient has undergone a tubal ligation or the insertion of an intrauterine device (Copper T 380A or LNg 20). No other contraceptive measures are required for these patients.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%:

Cardiovascular: Peripheral edema (17%)

Central nervous system: Headache (15%)

1% to 10%:

Cardiovascular: Palpitation (5%), flushing (4%)

Gastrointestinal: Constipation (4%), abdominal pain (3%)

Hematologic: Hemoglobin decreased (7% to 10%)

Hepatic: Liver enzymes increased (1% to 3%)

Respiratory: Nasal congestion (6%), dyspnea (4%), nasopharyngitis (3%), sinusitis (3%)

Postmarketing and/or case reports: Fluid retention

Metabolism/Transport Effects**Substrate** of CYP3A4 (major), 2C19 (major), P-glycoprotein

Drug Interactions

CycloSPORINE: May increase the serum concentration of Ambrisentan. *Risk C: Monitor therapy*

CYP2C19 Inducers (Strong): May increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Moderate): May decrease the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP2C19 Inhibitors (Strong): May decrease the metabolism of CYP2C19 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Grapefruit/grapefruit juice may increase levels/effects of ambrisentan.

Herb/Nutraceutical: Avoid St John’s wort (concurrent use may decrease levels/effects of ambrisentan).

Monitoring ParametersSerum transaminase (AST and ALT) and bilirubin should be determined prior to the initiation of therapy (baseline) and at monthly intervals thereafter. Monitor for clinical signs and symptoms of liver injury (eg, abdominal pain, fatigue, fever, jaundice, nausea, vomiting). Reduce dose or interrupt therapy if transaminases >3 times ULN and ≤5 times ULN and discontinue therapy with levels >5 times ULN and ≤8 times ULN. Monitor levels every 2 weeks until they are <3 times ULN. Therapy may be resumed with more frequent monitoring of levels. Discontinue therapy in patients with transaminases >8 times ULN, elevated transaminases with accompanying symptoms of hepatic injury, or bilirubin >2 times ULN. Monitor for significant peripheral edema and evaluate etiology if it occurs.

A woman of childbearing potential must have a negative pregnancy test prior to the initiation of therapy and monthly thereafter. Hemoglobin and hematocrit should be measured at baseline, at 1 month, and periodically thereafter (generally stabilizes after the first few weeks of treatment).

Nursing: Physical Assessment/MonitoringMonitor therapeutic response and adverse reactions at the beginning and periodically throughout therapy. Assess for symptoms of hepatic problems and fluid retention. Monitor laboratory tests. Assess other prescription and OTC medications the patient may be taking to avoid duplications and interactions. Assess knowledge/teach patient appropriate use, side effects, and symptoms to report. Pregnancy risk factor X; pregnancy must be excluded before starting medication.

Monitoring: Lab TestsSerum transaminase (AST and ALT) and bilirubin should be determined prior to the initiation of therapy (baseline) and at monthly intervals thereafter. Monitor for clinical signs and symptoms of liver injury (eg, abdominal pain, fatigue, fever, jaundice, nausea, vomiting). Reduce dose or interrupt therapy if transaminases >3 times ULN and ≤5 times ULN and discontinue therapy with levels >5 times ULN and ≤8 times ULN. Monitor levels every 2 weeks until they are <3 times ULN. Therapy may be resumed with more frequent monitoring of levels. Discontinue therapy in patients with transaminases >8 times ULN, elevated transaminases with accompanying symptoms of hepatic injury, or bilirubin >2 times ULN. Monitor for significant peripheral edema and evaluate etiology if it occurs.

A woman of childbearing potential must have a negative pregnancy test prior to the initiation of therapy and monthly thereafter. Hemoglobin and hematocrit should be measured at baseline, at 1 month, and periodically thereafter (generally stabilizes after the first few weeks of treatment).

Patient EducationInform prescriber of all prescription medications, OTC medications, or herbal products you are taking. Do not take any new medications without consulting prescriber. Pregnancy must be excluded prior to initiation and monthly thereafter. Two forms of contraception must be used during therapy (except in patients with tubal ligation or an implanted IUD). Avoid grapefruit or grapefruit juice. Maintain adequate hydration (2-3 L/day) unless instructed to restrict intake by prescriber. You may experience headache, nasal congestion, fatigue, or constipation (increasing exercise, fluids, fruit/fiber may help). Report signs of fluid retention (unusual weight gain >3-5 pounds/week, swelling of the extremities); shortness of breath; unusual bleeding or bruising; change in color of urine or stool; loss of appetite; abdominal pain; yellowing of skin or eyes; or unusual fatigue. **Pregnancy/breast-feeding precautions:** Do not get pregnant. This drug should not be used in the 2nd or 3rd trimester of pregnancy. Consult prescriber for appropriate contraception methods if necessary or if you suspect you might be pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Letairis™: 5 mg, 10 mg

Generic AvailableNo

ManufacturerGilead Sciences, Inc

Mechanism of ActionBlocks endothelin receptor subtypes ET_A and ET_B on vascular endothelium and smooth muscle. Stimulation of these receptors in smooth muscle cells is associated with vasoconstriction. Simulation of ET_B receptors in endothelial cells is associated with vasodilation and antiproliferative effects. Although ambrisentan blocks both ET_A and ET_B receptors, the affinity is greater for the A subtype. Improvement in symptoms of pulmonary artery hypertension and a decrease in the rate of clinical deterioration have been demonstrated in clinical trials.

Pharmacodynamics/Kinetics

Absorption: Rapid

Protein binding: 99%

Metabolism: Hepatic via CYP3A4, CYP2C19, and uridine 5'-diphosphate glucuronosyltransferases (UGTs) 1A9S, 2B7S, and 1A3S; *in vitro* studies also suggest it is a substrate of organic anion transport protein (OATP) and P-glycoprotein (P-gp)

Half-life elimination: 9 hours

Time to peak, plasma: 2 hours

Excretion: Primarily nonrenal

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Endothelin antagonists have caused bleeding gums; there have been no specific reports for ambrisentan

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusHeadache is common

Mental Health: Effects on Psychiatric TreatmentPeripheral edema is common; concomitant use with lithium may produce additive effects. High potential for drug-drug interactions. Carbamazepine, phenobarbital, phenytoin, secobarbital, and St John's wort may decrease the levels/effects of ambrisentan. Fluvoxamine and nefazodone may increase the levels/effects of ambrisentan.

Amcinonide

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(am SIN oh nide)

Canadian Brand NamesAmcort®; Cyclocort®; ratio-Amcinonide; Taro-Amcinonide

Pharmacologic CategoryCorticosteroid, Topical

Use: Labeled IndicationsRelief of the inflammatory and pruritic manifestations of corticosteroid-responsive dermatoses (high potency corticosteroid)

Dosing: AdultsSteroid-responsive dermatoses: Topical: Apply in a thin film 2-3 times/day. Therapy should be discontinued when control is achieved; if no improvement is seen, reassessment of diagnosis may be necessary.

Dosing: ElderlyRefer to adult dosing.

ContraindicationsHypersensitivity to amcinonide or any component of the formulation; use on the face, groin, or axilla

Allergy Considerations

- Corticosteroid Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal suppression: Systemic absorption of topical corticosteroids may cause hypothalamic-pituitary-adrenal (HPA) axis suppression (reversible) particularly in younger children. HPA axis suppression may lead to adrenal crisis. Risk is increased when used over large surface areas, for prolonged periods, or with occlusive dressings.

- Contact dermatitis: Allergic contact dermatitis can occur, it is usually diagnosed by failure to heal rather than clinical exacerbation.

- Kaposi's sarcoma: Prolonged treatment with corticosteroids has been associated with the development of Kaposi's sarcoma (case reports); if noted, discontinuation of therapy should be considered.

- Systemic effects: Adverse systemic effects including hyperglycemia, glycosuria, fluid and electrolyte changes, and HPA suppression may occur when used on large surface areas, for prolonged periods, or with an occlusive dressing.

Disease-related concerns:

- Infected/weeping lesions: Occlusive dressings should not be used in presence of infection or weeping lesions.

Special populations:

- Pediatrics: Chronic use of corticosteroids in children may interfere with growth and development.

Geriatric ConsiderationsDue to age-related changes in skin, limit use of topical glucocorticosteroids.

Pregnancy Risk FactorC

Adverse ReactionsFrequency not defined.

Dermatologic: Acne, hypopigmentation, allergic dermatitis, maceration of the skin, skin atrophy, striae, miliaria, telangiectasia

Endocrine & metabolic: Cushing's syndrome, growth retardation (long-term use), HPA suppression, hyperglycemia; these reactions occur more frequently with occlusive dressings

Local: Burning, itching, irritation, dryness, folliculitis, hypertrichosis

Miscellaneous: Secondary infection

Drug Interactions

Corticorelin: Corticosteroids may diminish the therapeutic effect of Corticorelin. Specifically, the plasma ACTH response to corticorelin may be blunted by recent or current corticosteroid therapy. *Risk C: Monitor therapy*

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream: 0.1% (15 g, 30 g, 60 g) [contains benzyl alcohol]

Lotion: 0.1% (60 mL)

Medication Safety Issues

Sound-alike/look-alike issues:

Ethyol® may be confused with ethanol

Pronunciation(am i FOS teen)
U.S. Brand NamesEthyol®
Canadian Brand NamesEthyol®
Pharmacologic Category[Adjuvant, Chemoprotective Agent (Cytoprotective)](); [Antidote]()
Use: Labeled IndicationsReduce the incidence of moderate to severe xerostomia in patients undergoing postoperative radiation treatment for head and neck cancer, where the radiation port includes a substantial portion of the parotid glands; reduce the cumulative renal toxicity associated with repeated administration of cisplatin
Use: Unlabeled/InvestigationalPrevention of radiation proctitis in patients with rectal cancer
Dosing: Adults**Note:** Antiemetic medication, including dexamethasone 20 mg I.V. and a serotonin 5-HT_3 receptor antagonist, is recommended prior to and in conjunction with amifostine.
Cisplatin-induced renal toxicity, reduction: I.V.: 910 mg/m^2 once daily over 15 minutes 30 minutes prior to cytotoxic therapy

For 910 mg/m^2 doses, the manufacturer suggests the following blood pressure-based adjustment schedule:

The infusion of amifostine should be interrupted if the systolic blood pressure decreases significantly from baseline, as defined below:

Decrease of 20 mm Hg if baseline systolic blood pressure <100

Decrease of 25 mm Hg if baseline systolic blood pressure 100-119

Decrease of 30 mm Hg if baseline systolic blood pressure 120-139

Decrease of 40 mm Hg if baseline systolic blood pressure 140-179

Decrease of 50 mm Hg if baseline systolic blood pressure ≥180

If blood pressure returns to normal within 5 minutes (assisted by fluid administration and postural management) and the patient is asymptomatic, the infusion may be restarted so that the full dose of amifostine may be administered. If the full dose of amifostine cannot be administered, the dose of amifostine for subsequent cycles should be 740 mg/m^2.

Xerostomia from head and neck cancer, reduction:

I.V.: 200 mg/m^2 over 3 minutes once daily 15-30 minutes prior to radiation therapy **or**

SubQ (unlabeled route): 500 mg once daily prior to radiation therapy

Prevention of radiation proctitis in rectal cancer (unlabeled use): I.V.: 340 mg/m^2 once daily prior to radiation therapy (Keefe, 2007; Peterson, 2008)

Dosing: ElderlyRefer to adult dosing.
Calculations

- [Body Surface Area: Adults]()

Administration: I.V.Administer over 3 minutes (prior to radiation therapy) or 15 minutes (prior to cisplatin); administration as a longer infusion is associated with a higher incidence of side effects. Patients should be kept in supine position during infusion.
Administration: I.V. DetailpH: 7
Administration: OtherSubQ administration (unlabeled) has been used.
StorageStore intact vials of lyophilized powder at room temperature of 20°C to 25°C (68°F to 77°F). Reconstituted solutions (500 mg/10 mL) and solutions for infusion are chemically stable for up to 5 hours at room temperature (25°C) or up to 24 hours under refrigeration (2°C to 8°C).
ReconstitutionFor I.V. infusion, reconstitute intact vials with 9.7 mL 0.9% sodium chloride injection and dilute in 0.9% sodium chloride to a final concentration of 5-40 mg/mL. For SubQ administration, reconstitute with 2.5 mL NS or SWFI.
CompatibilityStable in NS.

Y-site administration: Compatible: Amikacin, aminophylline, ampicillin, ampicillin/sulbactam, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, cimetidine, ciprofloxacin, clindamycin, co-trimoxazole, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daunorubicin HCl, dexamethasone sodium phosphate, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin HCl, doxycycline, droperidol, enalaprilat, etoposide, famotidine, floxuridine, fluconazole, fludarabine, fluorouracil, furosemide, gallium nitrate, gemcitabine, gentamicin, granisetron, haloperidol lactate, heparin, hydrocortisone sodium succinate, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, leucovorin calcium, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, mesna, methotrexate, methylprednisolone sodium succinate, metoclopramide, metronidazole, mitomycin, mitoxantrone, morphine, nalbuphine, ondansetron, pemetrexed, piperacillin, potassium chloride, promethazine, ranitidine, sodium bicarbonate, streptozocin, teniposide, thiotepa, ticarcillin/clavulanate, tobramycin, vancomycin, vinblastine, vincristine, zidovudine. **Incompatible:** Acyclovir, amphotericin B, chlorpromazine, cisplatin, ganciclovir, hydroxyzine HCl, prochlorperazine edisylate.

ContraindicationsHypersensitivity to aminothiol compounds or any component of the formulation

Allergy Considerations

- Mannitol Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Cutaneous reactions: Serious cutaneous reactions, including erythema multiforme, Stevens-Johnson syndrome, toxic epidermal necrolysis, toxoderma, and exfoliative dermatitis have been reported with amifostine. May be delayed, developing up to weeks after treatment initiation. Cutaneous reactions have been reported more frequently when used as a radioprotectant. Discontinue treatment for severe/serious cutaneous reaction, or with fever. Withhold treatment and obtain dermatologic consultation for rash involving lips or mucosa (of unknown etiology outside of radiation port) and for bullous, edematous or erythematous lesions on hands, feet or trunk; reinitiate only after careful evaluation.

- Hypersensitivity reactions: Rare hypersensitivity reactions, including anaphylaxis and allergic reaction, have been reported. Discontinue if allergic reaction occurs; do not rechallenge. Medications for the treatment of hypersensitivity reactions should be available.

- Hypocalcemia: Reports of clinically-relevant hypocalcemia are rare, but serum calcium levels should be monitored in patients at risk of hypocalcemia, such as those with nephrotic syndrome, or patients receiving multiple amifostine doses. May require calcium supplementation.

- Hypotension: Hypotension may occur during or shortly after infusion. Patients who are hypotensive or dehydrated should not receive amifostine. Adequately hydrate prior to treatment and keep in a supine position during the infusion. Monitor blood pressure every 5 minutes during the infusion. If hypotension requiring interruption of therapy occurs, patients should be placed in the Trendelenburg position and given an infusion of normal saline using a separate I.V. line; subsequent infusions may require a dose reduction. Infusions >15 minutes are associated with a higher incidence of adverse effects.

- Nausea/vomiting: The incidence of nausea and vomiting is higher in patients receiving amifostine, compared to chemotherapy alone. Antiemetic medications, including dexamethasone 20 mg I.V. and a serotonin 5-HT_3 receptor antagonist, should be administered prior to and in conjunction with amifostine. Use with caution in patients whom the adverse effects of nausea/vomiting may have serious adverse events.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease or whom the adverse effects of hypotension may have serious adverse events.

- Cerebrovascular disease: Use with caution in patients with cerebrovascular disease.

Concurrent drug therapy issues:

- Antihypertensive therapy: Interrupt antihypertensive therapy for 24 hours before treatment; patients who cannot safely stop their antihypertensives 24 hours before should not receive amifostine.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate use: Should not be used (in patients receiving chemotherapy for malignancies other than ovarian cancer) where chemotherapy is expected to provide significant survival benefit or in patients receiving definitive radiotherapy, unless within the context of a clinical trial.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal studies have demonstrated embryotoxicity. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsDue to the potential for adverse reactions in the nursing infant, breast-feeding should be discontinued.

Adverse Reactions

>10%:

Cardiovascular: Hypotension (15% to 61%; grades 3/4: 3% to 8%; dose dependent)

Gastrointestinal: Nausea/vomiting (53% to 96%; grades 3/4: 8% to 30%; dose dependent)

1% to 10%: Endocrine & metabolic: Hypocalcemia (clinically significant: 1%)

<1%, postmarketing, and/or case reports: Apnea, anaphylactoid reactions, anaphylaxis, arrhythmia, atrial fibrillation, atrial flutter, back pain, bradycardia, cardiac arrest, chest pain, chest tightness, chills, cutaneous eruptions, dizziness, erythema multiforme, exfoliative dermatitis, extrasystoles, dyspnea, fever, flushing, hiccups, hypersensitivity reactions (fever, rash, hypoxia, dyspnea, laryngeal edema), hypertension (transient), hypoxia, malaise, MI, myocardial ischemia, pruritus, rash (mild), renal failure, respiratory arrest, rigors, seizure, sneezing, somnolence, Stevens-Johnson syndrome, supraventricular tachycardia, syncope, tachycardia, toxic epidermal necrolysis,

toxoderma, urticaria

Oncology: VesicantNo

Oncology: Emetic Potential

Higher doses: Moderate-to-high (30% to 90%)

Low-dose: Low (10% to 30%)

Drug Interactions

Antihypertensives: May enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Monitoring ParametersBlood pressure should be monitored every 5 minutes during the infusion and after administration if clinically indicated; serum calcium levels (in patients at risk for hypocalcemia). Evaluate for cutaneous reactions prior to each dose.

Nursing: Physical Assessment/MonitoringMonitor blood pressure closely during infusion (continuously or every 5-7 minutes; see Dosing). Can cause hypotension. Ensure adequate hydration prior to administration. Monitor nausea and treat with antiemetic as appropriate.

Monitoring: Lab TestsSerum calcium levels (in patients at risk for hypocalcemia)

Patient EducationThis I.V. medication is given to help reduce side effects of your chemotherapy and/or radiation therapy. Report immediately any nausea; you will be given medication. Report chills, severe dizziness, tremors or shaking, or sudden onset of hiccups. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 500 mg

Ethyol®: 500 mg

Generic AvailableYes

Mechanism of ActionProdrug that is dephosphorylated by alkaline phosphatase in tissues to a pharmacologically-active free thiol metabolite. The free thiol is available to bind to, and detoxify, reactive metabolites of cisplatin; and can also act as a scavenger of free radicals that may be generated (by cisplatin or radiation therapy) in tissues.

Pharmacodynamics/Kinetics

Distribution: V_d: 3.5 L

Metabolism: Hepatic dephosphorylation to two metabolites (active-free thiol and disulfide)

Half-life elimination: ~8-9 minutes

Excretion: Urine

Clearance, plasma: 2.17 L/minute

Related Information

- Safe Handling of Hazardous Drugs

Pharmacotherapy Pearls**Oncology Comment:** The American Society of Clinical Oncology (ASCO) guidelines for the use of protectants for chemotherapy and radiation (Hensley, 2008) recommend the use of amifostine for prevention of nephrotoxicity due to cisplatin-based chemotherapy and to decrease the incidence of acute and delayed radiation therapy-induced xerostomia. The ASCO guidelines do not recommend the use of amifostine to reduce the incidence of neutropenia or thrombocytopenia associated with chemotherapy or radiation therapy, neurotoxicity or ototoxicity associated with platinum-based chemotherapy, radiation therapy-induced mucositis associated with head and neck cancer, or esophagitis due to chemotherapy in patients with nonsmall cell lung cancer. Additionally, the guidelines do not support the use of amifostine in patients with head and neck cancer receiving concurrent platinum-based chemotherapy.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness is common

Mental Health: Effects on Psychiatric TreatmentHypotension is common and may be additive with psychotropics

Canadian Brand NamesAmikacin Sulfate Injection, USP; Amikin®

Pharmacologic CategoryAntibiotic, Aminoglycoside

Use: Labeled IndicationsTreatment of serious infections (bone infections, respiratory tract infections, endocarditis, and septicemia) due to organisms resistant to gentamicin and tobramycin, including *Pseudomonas*, *Proteus*, *Serratia*, and other gram-negative bacilli; documented infection of mycobacterial organisms susceptible to amikacin

Use: Unlabeled/InvestigationalBacterial endophthalmitis

Dosing: AdultsIndividualization is critical because of the low therapeutic index

Note: Use of ideal body weight (IBW) for determining the mg/kg/dose appears to be more accurate than dosing on the basis of total body weight (TBW)

In morbid obesity, dosage requirement may best be estimated using a dosing weight of IBW + 0.4 (TBW - IBW)

Initial and periodic peak and trough plasma drug levels should be determined, particularly in critically-ill patients with serious infections or in disease states known to significantly alter aminoglycoside pharmacokinetics (eg, cystic fibrosis, burns, or major surgery)

Usual dosage range: I.M., I.V.: 5-7.5 mg/kg/dose every 8 hours

Note: Some clinicians suggest a daily dose of 15-20 mg/kg for all patients with normal renal function. This dose is at least as efficacious with similar, if not less, toxicity than conventional dosing.

Indication-specific dosing:

Endophthalmitis, bacterial (unlabeled use): Intravitreal: 0.4 mg/0.1 mL NS in combination with vancomycin

Hospital-acquired pneumonia (HAP): I.V.: 20 mg/kg/day with antipseudomonal beta-lactam or carbapenem (American Thoracic Society/ATS guidelines)

Meningitis*(Pseudomonas aeruginosa):* I.V.: 5 mg/kg every 8 hours (administered with another bacteriocidal drug)

Mycobacterium fortuitum, M. chelonae, or M. abscessus: I.V.: 10-15 mg/kg daily for at least 2 weeks with high dose cefoxitin

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric **Usual dosage range:** Infants and Children: I.M., I.V.: 5-7.5 mg/kg/dose every 8 hours

Note: Individualization is critical because of the low therapeutic index

Use of ideal body weight (IBW) for determining the mg/kg/dose appears to be more accurate than dosing on the basis of total body weight (TBW)

In morbid obesity, dosage requirement may best be estimated using a dosing weight of IBW + 0.4 (TBW - IBW)

Initial and periodic peak and trough plasma drug levels should be determined, particularly in critically-ill patients with serious infections or in disease states known to significantly alter aminoglycoside pharmacokinetics (eg, cystic fibrosis, burns, or major surgery)

Dosing: Renal ImpairmentIndividualization is critical because of the low therapeutic index. Some patients may require larger or more frequent doses if serum levels document the need (ie, cystic fibrosis or febrile granulocytopenic patients).

Cl_{cr} ≥60 mL/minute: Administer every 8 hours

Cl_{cr} 40-60 mL/minute: Administer every 12 hours

Cl_{cr} 20-40 mL/minute: Administer every 24 hours

Cl_{cr} <20 mL/minute: Loading dose, then monitor levels

Dialyzable (50% to 100%)

Administer dose postdialysis or administer $^{2}/_{3}$ normal dose as a supplemental dose postdialysis and follow levels.

Peritoneal dialysis effects: Dose as for Cl_{cr} <20 mL/minute: Follow levels.

Continuous arteriovenous or venovenous hemodiafiltration effects: Dose as for Cl_{cr} 10-40 mL/minute: Follow levels.

Calculations

- Adjusted Body Weight
- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics
- Ideal Body Weight: Adults
- Ideal Body Weight: Pediatrics

Administration: I.M.Administer I.M. injection in large muscle mass. Administer around-the-clock to promote less variation in peak and trough serum levels. Do not mix with other drugs, administer separately.

Administration: I.V.Infuse over 30-60 minutes.

Some penicillins (eg, carbenicillin, ticarcillin, and piperacillin) have been shown to inactivate *in vitro*. This has been observed to a greater extent with tobramycin and gentamicin, while amikacin has shown greater stability against inactivation. Concurrent use of these agents may pose a risk of reduced antibacterial efficacy *in vivo*, particularly in the setting of profound renal impairment. However, definitive clinical evidence is lacking. If combination penicillin/aminoglycoside therapy is desired in a patient with renal dysfunction, separation of doses (if feasible), and routine monitoring of aminoglycoside levels, CBC, and clinical response should be considered.

Administration: I.V. DetailAdminister around-the-clock to promote less variation in peak and trough serum levels. Do not mix with other drugs, administer separately.

pH: 3.5-5.5

Dietary ConsiderationsSodium content of 1 g: 29.9 mg (1.3 mEq)

StorageStore at controlled room temperature. Following admixture at concentrations of 0.25-5 mg/mL, amikcain is stable for 24 hours at room temperature and 2 days at refrigeration when mixed in D_5W, NS, and LR.

CompatibilityStable in dextran 75 6% in NS, D_5LR, $D_5{}^1/_4NS$, $D_5{}^1/_3NS$, $D_5{}^1/_2NS$, D_5NS, $D_{10}NS$, D_5W, $D_{10}W$, $D_{20}W$, mannitol 20%, $^1/_4NS$, $^1/_2NS$, NS; **variable stability (consult detailed reference)** in peritoneal dialysis solutions.

Y-site administration: Compatible: Acyclovir, alatrofloxacin, amifostine, amiodarone, amsacrine, aztreonam, cefpirome, cisatracurium, cyclophosphamide, dexamethasone sodium phosphate, diltiazem, docetaxel, enalaprilat, esmolol, etoposide, filgrastim, fluconazole, fludarabine, foscarnet, furosemide, gatifloxacin, gemcitabine, granisetron, idarubicin, IL-2, labetalol, levofloxacin, linezolid, lorazepam, magnesium sulfate, melphalan, midazolam, morphine, ondansetron, paclitaxel, perphenazine, remifentanil, sargramostim, teniposide, thiotepa, vinorelbine, warfarin, zidovudine. **Incompatible:** Allopurinol, amphotericin B cholesteryl sulfate complex, hetastarch, propofol.

Compatibility in syringe: Compatible: Clindamycin, doxapram. **Incompatible:** Heparin.

Compatibility when admixed: Compatible: Amobarbital, ascorbic acid injection, bleomycin, calcium chloride, calcium gluconate, cefepime, cefoxitin, chloramphenicol, chlorpheniramine, cimetidine, ciprofloxacin, clindamycin, colistimethate, dimenhydrinate, diphenhydramine, epinephrine, ergonovine, fluconazole, furosemide, hyaluronidase, hydrocortisone sodium phosphate, hydrocortisone sodium succinate, lincomycin, metaraminol, metronidazole, metronidazole with sodium bicarbonate, norepinephrine, pentobarbital, phenobarbital, phytonadione, polymyxin B sulfate, prochlorperazine edisylate, promethazine, ranitidine, sodium bicarbonate, succinylcholine, vancomycin, verapamil. **Incompatible:** Amphotericin B, ampicillin, cefazolin, chlorothiazide, heparin, phenytoin, thiopental, vitamin B complex with C. **Variable (consult detailed reference):** Aminophylline, dexamethasone sodium phosphate, oxacillin, penicillin G potassium, potassium chloride.

ContraindicationsHypersensitivity to amikacin sulfate or any component of the formulation; cross-sensitivity may exist with other aminoglycosides

Warnings/Precautions

Boxed Warnings:

- Nephrotoxicity: See “Concerns related to adverse effects” below.
- Neuromuscular blockade and respiratory paralysis: See “Concerns related to adverse effects” below.
- Neurotoxicity: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Nephrotoxicity: **[U.S. Boxed Warning]: May cause nephrotoxicity;** usual risk factors include pre-existing renal impairment, concomitant nephrotoxic medications, advanced age and dehydration. Discontinue treatment if signs of nephrotoxicity occur; renal damage is usually reversible.
- Neuromuscular blockade and respiratory paralysis: **[U.S. Boxed Warning]: May cause neuromuscular blockade and respiratory paralysis;** especially when given soon after anesthesia or muscle relaxants.
- Neurotoxicity: **[U.S. Boxed Warning]: May cause neurotoxicity;** usual risk factors include pre-existing renal impairment, concomitant neuro-/nephrotoxic medications, advanced age and dehydration. Ototoxicity is proportional to the amount of drug given and the duration of treatment. Tinnitus or vertigo may be indications of vestibular injury and impending bilateral irreversible damage. Discontinue treatment if signs of ototoxicity occur.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Hearing impairment: Use with caution in patients with pre-existing vertigo, tinnitus, or hearing loss.
- Hypocalcemia: Use with caution in patients with hypocalcemia.
- Neuromuscular disorders: Use with caution in patients with neuromuscular disorders, including myasthenia gravis.
- Renal impairment: Use with caution in patients with pre-existing renal insufficiency; dosage modification required.

Dosage form specific issues:

- Sulfite: Solution contains sodium metabisulfate; use caution in patients with sulfite allergy.

Geriatric ConsiderationsThe aminoglycosides are important therapeutic interventions for infections due to susceptible organisms and as empiric therapy in seriously ill patients. Their use is not without risk of toxicity, however, these risks can be minimized if initial dosing is adjusted for estimated renal function and appropriate monitoring performed. High dose, once daily aminoglycosides have been advocated as an alternative to traditional dosing regimens. Once daily or extended interval dosing is as effective and may be safer than traditional dosing. Interval must be adjusted for renal function.

Pregnancy Risk FactorD

Pregnancy Considerations

Amikacin crosses the placenta, produces detectable serum levels in the fetus, and concentrates in the fetal kidneys. Because of several reports of total irreversible bilateral congenital deafness in children whose mothers received streptomycin during pregnancy, the manufacturer classifies amikacin as pregnancy risk factor D. Renal toxicity has been observed in animals, but fetal toxicity in humans has not been reported. No adequate and well-controlled studies have been conducted in pregnant women and it is not known whether amikacin can cause fetal harm. Although the manufacturer considers amikacin pregnancy risk factor D, amikacin-specific clinical data would suggest pregnancy risk factor C.

Due to pregnancy-induced physiologic changes, some pharmacokinetic parameters of amikacin may be altered. Pregnant women have an average-to-larger volume of distribution which may result in lower peak serum levels than for the same dose in nonpregnant women. Serum half-life is also shorter.

LactationEnters breast milk/compatible

Breast-Feeding ConsiderationsAmikacin is excreted into breast milk in trace amounts; however, it is not absorbed when taken orally. This limited oral absorption may minimize exposure to the nursing infant. Nondose-related effects could include modification of bowel flora.

Pregnancy & Lactation, In-Depth

- Amikacin in Pregnancy & Lactation

Adverse Reactions

1% to 10%:

Central nervous system: Neurotoxicity

Otic: Ototoxicity (auditory), ototoxicity (vestibular)

Renal: Nephrotoxicity

<1%: Allergic reaction, arthralgia, drowsiness, drug fever, dyspnea, eosinophilia, headache, hypotension, nausea, paresthesia, rash, tremor, vomiting, weakness

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Amphotericin B: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Bisphosphonate Derivatives: Aminoglycosides may enhance the hypocalcemic effect of Bisphosphonate Derivatives. *Risk C: Monitor therapy*

Botulinum Toxin Type A: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type A. *Risk C: Monitor therapy*

Botulinum Toxin Type B: Aminoglycosides may enhance the neuromuscular-blocking effect of Botulinum Toxin Type B. *Risk C: Monitor therapy*

Capreomycin: May enhance the neuromuscular-blocking effect of Aminoglycosides. *Risk C: Monitor therapy*

CARBOplatin: Aminoglycosides may enhance the ototoxic effect of CARBOplatin. Especially with higher doses of carboplatin. *Risk C: Monitor therapy*

CISplatin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Colistimethate: Aminoglycosides may enhance the nephrotoxic effect of Colistimethate. Aminoglycosides may enhance the neuromuscular-blocking effect of Colistimethate. *Risk D: Consider therapy modification*

CycloSPORINE: Aminoglycosides may enhance the nephrotoxic effect of CycloSPORINE. *Risk C: Monitor therapy*

Gallium Nitrate: Aminoglycosides may enhance the nephrotoxic effect of Gallium Nitrate. *Risk X: Avoid combination*

Loop Diuretics: May enhance the adverse/toxic effect of Aminoglycosides. Specifically, nephrotoxicity and ototoxicity. *Risk C: Monitor therapy*

Neuromuscular-Blocking Agents: Aminoglycosides may enhance the respiratory depressant effect of Neuromuscular-Blocking Agents. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May decrease the excretion of Aminoglycosides. Data only in premature infants. *Risk C: Monitor therapy*

Penicillins: May decrease the serum concentration of Aminoglycosides. Primarily associated with extended spectrum penicillins, and patients with renal dysfunction. **Exceptions:** Amoxicillin; Ampicillin; Cloxacillin; Dicloxacillin; Methicillin; Nafcillin; Oxacillin; Penicillin G (Parenteral/Aqueous); Penicillin G Benzathine; Penicillin G Procaine; Penicillin V Potassium. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Vancomycin: May enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Test InteractionsSome penicillin derivatives may accelerate the degradation of aminoglycosides *in vitro*, leading to a potential underestimation of aminoglycoside serum concentration.

Monitoring ParametersUrinalysis, BUN, serum creatinine, appropriately timed peak and trough concentrations, vital signs, temperature, weight, I & O, hearing parameters

Some penicillin derivatives may accelerate the degradation of aminoglycosides *in vitro*. This may be clinically-significant for certain penicillin (ticarcillin, piperacillin, carbenicillin) and aminoglycoside (gentamicin, tobramycin) combination therapy in patients with significant renal impairment. Close monitoring of aminoglycoside levels is warranted.

Reference Range

Sample size: 0.5-2 mL blood (red top tube) or 0.1-1 mL serum (separated)

Therapeutic levels:

Peak:

Life-threatening infections: 25-40 mcg/mL

Serious infections: 20-25 mcg/mL

Urinary tract infections: 15-20 mcg/mL

Trough: <8 mcg/mL

The American Thoracic Society (ATS) recommends trough levels of <4-5 mcg/mL for patients with hospital-acquired pneumonia.

Toxic concentration: Peak: >40 mcg/mL; Trough: >10 mcg/mL

Timing of serum samples: Draw peak 30 minutes after completion of 30-minute infusion or at 1 hour following initiation of infusion or I.M. injection; draw trough within 30 minutes prior to next dose

Nursing: Physical Assessment/MonitoringAssess allergy history prior to beginning therapy. Assess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess results of laboratory tests, therapeutic effectiveness, and adverse response. Monitor for ototoxicity, nephrotoxicity, neurotoxicity. Hearing and renal status should be assessed before, during, and after therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsPerform culture and sensitivity testing prior to initiating therapy. Urinalysis, BUN, serum creatinine, appropriately timed peak and trough concentrations. Initial and periodic peak and trough plasma drug levels should be determined, particularly in critically-ill patients with serious infections or in disease states known to significantly alter aminoglycoside pharmacokinetics (eg, cystic fibrosis, burns, or major surgery). Aminoglycoside levels measured from blood taken from Silastic® central catheters can sometimes give falsely high readings (draw levels from alternate lumen or peripheral stick, if possible). Some penicillin derivatives may accelerate the degradation of aminoglycosides.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This drug can only be administered by I.V. or I.M. injection. It is important to maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. Report immediately any change in hearing acuity, ringing or roaring in ears, alteration in balance, vertigo, feeling of fullness in head; pain, tingling, or numbness of any body part; or change in urinary pattern or decrease in urine. Report signs of opportunistic infection (eg, white plaques in mouth, vaginal discharge, unhealed sores, sore throat, unusual fever, chills); persistent diarrhea; pain, redness, or swelling at injection site; or other adverse reactions. **Pregnancy precaution:** Inform prescriber if you are or intend to become pregnant.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as sulfate: 50 mg/mL (2 mL); 250 mg/mL (2 mL, 4 mL)

Generic AvailableYes

Mechanism of ActionInhibits protein synthesis in susceptible bacteria by binding to 30S ribosomal subunits

Pharmacodynamics/Kinetics

Absorption:

I.M.: Rapid

Oral: Poorly absorbed

Distribution: Primarily into extracellular fluid (highly hydrophilic); penetrates blood-brain barrier when meninges inflamed

Relative diffusion of antimicrobial agents from blood into CSF: Good only with inflammation (exceeds usual MICs)

CSF:blood level ratio: Normal meninges: 10% to 20%; Inflamed meninges: 15% to 24%

Protein-binding: 0% to 11%

Half-life elimination (renal function and age dependent):

Infants: Low birth weight (1-3 days): 7-9 hours; Full-term >7 days: 4-5 hours

Children: 1.6-2.5 hours

Adults: Normal renal function: 1.4-2.3 hours; Anuria/end-stage renal disease: 28-86 hours

Time to peak, serum: I.M.: 45-120 minutes

Excretion: Urine (94% to 98%)

Pronunciation(a MIL oh ride & hye droe klor oh THYE a zide)

Canadian Brand NamesApo-Amilzide®; Gen-Amilazide; Moduret; Novamilor; Nu-Amilzide

Pharmacologic CategoryDiuretic, Combination

Use: Labeled IndicationsPotassium-sparing diuretic; antihypertensive

Dosing: AdultsHypertension, edema: Oral: Initial: 1 tablet/day; may be increased to 2 tablets/day if needed; usually given in a single dose

Dosing: ElderlyOral: Initial: $^1/_2$ to 1 tablet/day

Dosing: Renal ImpairmentSee individual agents.

Dietary ConsiderationsMay be taken with food.

Allergy Considerations

- Thiazide/Thiazide-Related Diuretic Allergy

Warnings/Precautions

Boxed warnings:

- Hyperkalemia: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Electrolyte disturbances: Hypochloremic alkalosis and hyponatremia can occur.
- Hyperkalemia: **[U.S. Boxed Warning]: Hyperkalemia can occur; patients at risk include those with renal impairment, diabetes, the elderly, and the severely ill. Serum potassium levels must be monitored at frequent intervals especially when dosages are changed or with any illness that may cause renal dysfunction.**
- Photosensitivity: Photosensitization may occur with hydrochlorothiazide.
- Sulfa allergy: Chemical similarities are present among sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid). Use in patients with sulfonamide allergy is specifically contraindicated in product labeling, however, a risk of cross-reaction exists in patients with allergy to any of these compounds; avoid use when previous reaction has been severe. Discontinue if signs of hypersensitivity are noted.

Disease-related concerns:

- Diabetes: Use with extreme caution in patients with diabetes mellitus; may see a change in glucose control. Monitor closely; discontinue amiloride 3 days prior to glucose tolerance testing.
- Gout: In certain patients with a history of gout, a familial predisposition to gout, or chronic renal failure, gout can be precipitated with hydrochlorothiazide.
- Hepatic impairment: Use hydrochlorothiazide with caution in patients with severe hepatic dysfunction; in cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.
- Hypercholesterolemia: Use hydrochlorothiazide with caution in patients with moderate or high cholesterol concentrations.
- Metabolic/respiratory acidosis: Use with caution in patients who are at risk for metabolic or respiratory acidosis (eg, cardiopulmonary disease, uncontrolled diabetes).
- Renal impairment: Avoid use of hydrochlorothiazide in severe renal disease (ineffective).
- Systemic lupus erythematosus (SLE): Hydrochlorothiazide can cause SLE exacerbation or activation.

Geriatric ConsiderationsPotassium excretion may be decreased in the elderly, increasing the risk of hyperkalemia with potassium-sparing diuretics such as amiloride.

Pregnancy Risk FactorB

Pregnancy ConsiderationsRefer to Hydrochlorothiazide.

LactationExcretion in breast milk unknown/contraindicated

Adverse ReactionsSee individual agents.

Drug Interactions

ACE Inhibitors: Potassium-Sparing Diuretics may enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

ACE Inhibitors: Thiazide Diuretics may enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Allopurinol: Thiazide Diuretics may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. Thiazide Diuretics may increase the serum concentration of Allopurinol. Specifically, Thiazide Diuretics may increase the concentration of Oxypurinolol, an active metabolite of Allopurinol. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Ammonium Chloride: Potassium-Sparing Diuretics may enhance the adverse/toxic effect of Ammonium Chloride. Specifically the risk of systemic acidosis. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the absorption of Thiazide Diuretics. The diuretic response is likewise decreased. *Risk D: Consider therapy modification*

Calcitriol: Thiazide Diuretics may enhance the hypercalcemic effect of Calcitriol. *Risk C: Monitor therapy*

Calcium Salts: Thiazide Diuretics may decrease the excretion of Calcium Salts. Continued concomitant use can also result in metabolic alkalosis. *Risk C: Monitor therapy*

Cardiac Glycosides: Potassium-Sparing Diuretics may diminish the therapeutic effect of Cardiac Glycosides. Specifically, the inotropic effects. *Risk C: Monitor therapy*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Dofetilide: Thiazide Diuretics may enhance the QTc-prolonging effect of Dofetilide. Thiazide Diuretics may increase the serum concentration of Dofetilide. *Risk D: Consider therapy modification*

Drospirenone: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. Management: This combination is contraindicated in patients receiving eplerenone for treatment of hypertension. *Risk D: Consider therapy modification*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Thiazide Diuretics may decrease the excretion of Lithium. *Risk D: Consider therapy modification*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Mitotane: Potassium-Sparing Diuretics may diminish the therapeutic effect of Mitotane. High dose diuretics (eg, Cushings syndrome) may present significantly higher risk than low doses (eg, CHF). *Risk D: Consider therapy modification*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Thiazide Diuretics. *Risk C: Monitor therapy*

Potassium Salts: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: Potassium-Sparing Diuretics may diminish the therapeutic effect of QuiNIDine. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Nursing: Physical Assessment/MonitoringSee individual agents.
Patient EducationSee individual agents.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 5/50: Amiloride hydrochloride 5 mg and hydrochlorothiazide 50 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Tablets (Amiloride-Hydrochlorothiazide)

5-50 mg (100): $27.99

Pharmacodynamics/KineticsSee individual agents.
Related Information

- AMILoride
- Hydrochlorothiazide

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause drowsiness; rarely may cause insomnia and depression
Mental Health: Effects on Psychiatric TreatmentMay cause impotence and orthostatic hypotension which may be exacerbated by psychotropics; effective agent for the treatment of lithium-induced diabetes insipidus

Cardiovascular Considerations Amiloride may cause hyperkalemia, the ECG manifestations of which include peaked T waves, QRS prolongation, and cardiac conduction abnormalities. Thiazide diuretics are effective first-line therapeutic agents in the management of hypertension and have proven to be of benefit in terms of cardiovascular outcome. The combination of amiloride and hydrochlorothiazide may act together to lower blood pressure and limit diuretic-induced changes in plasma potassium. The benefits of thiazide diuretics in the treatment of hypertension is established and compares well with other first-line therapeutic agents.

Diuretics are standard therapy for the management of edema in patients with heart failure.

Index Terms Hydrochlorothiazide and Amiloride

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

AMILoride may be confused with amiodarone, amLODIPine, amrinone

Pronunciation(a MIL oh ride)

Canadian Brand NamesApo-Amiloride®

Pharmacologic CategoryDiuretic, Potassium Sparing

Use: Labeled IndicationsCounteracts potassium loss induced by other diuretics in the treatment of hypertension or edematous conditions including CHF, hepatic cirrhosis, and hypoaldosteronism; usually used in conjunction with more potent diuretics such as thiazides or loop diuretics

Use: Unlabeled/InvestigationalInvestigational: Cystic fibrosis; reduction of lithium-induced polyuria; pediatric hypertension

Dosing: AdultsHypertension, edema (to limit potassium loss): Oral: Initial: 5-10 mg/day (up to 20 mg)

Hypertension (JNC 7): 5-10 mg/day in 1-2 divided doses

Dosing: ElderlyOral: Initial: 5 mg once daily or every other day

Dosing: PediatricHypertension (unlabeled use): Children 1-17 years: Oral: 0.4-0.625 mg/kg/day (maximum: 20 mg/day)

Dosing: Renal ImpairmentOral:

Cl_{cr} 10-50 mL/minute: Administer 50% of normal dose.

Cl_{cr} <10 mL/minute: Avoid use.

Calculations

- Creatinine Clearance: Adults

Administration: OralAdminister with food or meals to avoid GI upset.

Dietary ConsiderationsTake with food or meals to avoid GI upset. Do not use salt substitutes or low salt milk without checking with your healthcare provider; too much potassium can be as harmful as too little.

ContraindicationsHypersensitivity to amiloride or any component of the formulation; presence of elevated serum potassium levels (>5.5 mEq/L); if patient is receiving other potassium-conserving agents (eg, spironolactone, triamterene) or potassium supplementation (medicine, potassium-containing salt substitutes, potassium-rich diet); anuria; acute or chronic renal insufficiency; evidence of diabetic nephropathy. Patients with evidence of renal impairment or diabetes mellitus should not receive this medicine without close, frequent monitoring of serum electrolytes and renal function.

Warnings/Precautions

Boxed warnings:

- Hyperkalemia: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Fluid/electrolyte loss: Excess amounts can lead to profound diuresis with fluid and electrolyte loss; close medical supervision and dose evaluation are required. Watch for and correct electrolyte disturbances; adjust dose to avoid dehydration.

- Hyperkalemia: **[U.S. Boxed Warning]: Hyperkalemia can occur; patients at risk include those with renal impairment, diabetes, the elderly, and the severely ill. Serum potassium levels must be monitored at frequent intervals especially when dosages are changed or with any illness that may cause renal dysfunction.**

Disease-related concerns:

- Cirrhosis: In cirrhosis, avoid electrolyte and acid/base imbalances that might lead to hepatic encephalopathy.

- Diabetes: Use with extreme caution in patients with diabetes mellitus; monitor closely. Discontinue amiloride 3 days prior to glucose tolerance testing.

- Metabolic/respiratory acidosis: Use with caution in patients who are at risk for metabolic or respiratory acidosis (eg, cardiopulmonary disease, uncontrolled diabetes).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsUse lower initial dose, and adjust dose for renal impairment.
Pregnancy Risk FactorB
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies.
LactationExcretion in breast milk unknown/not recommended
Adverse Reactions

1% to 10%:

Central nervous system: Headache, fatigue, dizziness

Endocrine & metabolic: Hyperkalemia (up to 10%; risk reduced in patients receiving kaliuretic diuretics), hyperchloremic metabolic acidosis, dehydration, hyponatremia, gynecomastia

Gastrointestinal: Nausea, diarrhea, vomiting, abdominal pain, gas pain, appetite changes, constipation

Genitourinary: Impotence

Neuromuscular & skeletal: Muscle cramps, weakness

Respiratory: Cough, dyspnea

<1% (Limited to important or life-threatening): Orthostatic hypotension, arrhythmia, palpitation, chest pain, alopecia, GI bleeding, polyuria, bladder spasms, dysuria, jaundice, intraocular pressure increased, dyspnea

Drug Interactions

ACE Inhibitors: Potassium-Sparing Diuretics may enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Ammonium Chloride: Potassium-Sparing Diuretics may enhance the adverse/toxic effect of Ammonium Chloride. Specifically the risk of systemic acidosis. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Cardiac Glycosides: Potassium-Sparing Diuretics may diminish the therapeutic effect of Cardiac Glycosides. Specifically, the inotropic effects. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Drospirenone: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. Management: This combination is contraindicated in patients receiving eplerenone for treatment of hypertension. *Risk D: Consider therapy modification*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Mitotane: Potassium-Sparing Diuretics may diminish the therapeutic effect of Mitotane. High dose diuretics (eg, Cushings syndrome) may present significantly higher risk than low doses (eg, CHF). *Risk D: Consider therapy modification*

Potassium Salts: May enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

QuiNIDine: Potassium-Sparing Diuretics may diminish the therapeutic effect of QuiNIDine. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsFood: Hyperkalemia may result if amiloride is taken with potassium-containing foods.
Test InteractionsIncreased potassium (S)
Monitoring ParametersI & O, daily weights, blood pressure, serum electrolytes, renal function
Nursing: Physical Assessment/MonitoringAssess need for caution (eg, patients at risk for hyperkalemia). Monitor for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. Assess results of laboratory tests (electrolytes), fluid status, therapeutic effectiveness, and adverse response (eg, dehydration, hyperkalemia, hyperchloremic metabolic acidosis, hyponatremia; see Adverse Reactions). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.
Monitoring: Lab TestsSerum electrolytes, renal function
Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take as directed, preferably early in day with food. Do not increase dietary intake of potassium unless instructed by prescriber (too much potassium can be as harmful as too little). May cause dizziness or fatigue (use caution when driving or engaging in tasks that require alertness until response to drug is known); constipation (increased exercise, fluids, fruit, and fiber may help); impotence (reversible); or loss of hair (rare). Report muscle cramping or weakness, unresolved nausea or vomiting, palpitations, or respiratory difficulty. **Breast-feeding precaution:** Do not breast-feed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride: 5 mg

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Tablets (Amiloride HCl)

5 mg (30): $26.99

Tablets (Midamor)

5 mg (30): $25.99

Mechanism of ActionInhibits sodium reabsorption in the distal tubule, cortical collecting tubule, and collecting duct subsequently reducing both potassium and hydrogen excretion resulting in weak natriuretic, diuretic, and antihypertensive activity; increases sodium loss; increases potassium retention; decreases calcium excretion; decreases magnesium loss
Pharmacodynamics/Kinetics

Onset of action: 2 hours

Duration: 24 hours

Absorption: ~15% to 25%

Distribution: V_d: 350-380 L

Protein binding: 23%

Metabolism: No active metabolites

Half-life elimination: Normal renal function: 6-9 hours; End-stage renal disease: 8-144 hours

Time to peak, serum: 6-10 hours

Excretion: Urine and feces (equal amounts as unchanged drug)

Related Information

- Heart Failure (Systolic)

Pharmacotherapy PearlsMedication should be discontinued if potassium level exceeds 6.5 mEq/L. Combined with hydrochlorothiazide as Moduretic®. Amiloride is considered an alternative to triamterene or spironolactone.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause drowsiness; rarely may cause insomnia and depression
Mental Health: Effects on Psychiatric TreatmentMay cause impotence and orthostatic hypotension which may be exacerbated by psychotropics; effective agent for the treatment of lithium-induced diabetes insipidus
Cardiovascular ConsiderationsAmiloride may cause hyperkalemia, the ECG manifestations of which include peaked T waves, QRS prolongation, and cardiac conduction abnormalities.
Anesthesia and Critical Care Concerns/Other ConsiderationsMedication should be discontinued if hyperkalemia develops. Amiloride may cause hyperkalemia. The ECG manifestations may include peaked T waves, QRS prolongation, and cardiac conduction abnormalities.
Index TermsAmiloride Hydrochloride

U.S. Brand NamesAminosyn®; Branchamin®; Clinisol®; FreAmine®; HepatAmine®; Hepatasol®; NephrAmine®; Novamine®; Premasol™; Prosol; Renamin®; Travasol®; TrophAmine®

Canadian Brand NamesAminosyn; Aminosyn-PF; Aminosyn-RF; Primene®

Pharmacologic CategoryIntravenous Nutritional Therapy

Use: Labeled IndicationsAs part of parenteral nutrition to prevent nitrogen loss or treat negative nitrogen balance when alimentary tract cannot be used (eg, GI absorption is impaired, bowel rest is needed). Specialty amino acid formulas may be considered only in certain instances.

Dosing: AdultsProtein as amino acids: I.V. (as a component of parenteral nutrition):

Maintenance: 0.8-1 g/kg/day

Normal/mild stress level: 1-1.2 g/kg/day

Moderate stress level: 1.2-1.5 g/kg/day

Severe stress level: 1.5-2 g/kg/day

Burn patients (severe): Increase protein until significant wound healing achieved

Solid organ transplant: Perioperative: 1.5-2 g/kg/day

Renal failure:

Acute (severely malnourished or hypercatabolic): 1.5-1.8 g/kg/day

Chronic, with dialysis: 1.2-1.3 g/kg/day

Chronic, without dialysis: 0.6-0.8 g/kg/day

Continuous hemofiltration: ≥1 g/kg/day

Hepatic failure:

Acute management when other treatments have failed:

With encephalopathy: 0.6-1 g/kg/day

Without encephalopathy: 1-1.5 g/kg/day

Chronic encephalopathy: Use branch chain amino acid enriched diets only if unresponsive to pharmacotherapy

Pregnant women in second or third trimester: Add an additional 10-14 g/day

Dosing: PediatricProtein as amino acids: I.V. (as a component of parenteral nutrition):

Term: Initial: 2.5 g/kg/day; Goal: 3 g/kg/day

Extremely (<1000 g) and very (<1500 g) low-birth-weight (stable): Initial: 1-1.5 g/kg/day; Goal: 3.5-3.85 g/kg/day to promote utero growth rates

Sepsis, hypoxia: Initial: 1 g/kg/day; goal: 3-3.85 g/kg/day

Administration: I.V.Administered as a component of peripheral parenteral or total parenteral nutrition. Peripheral administration of nutrition is dependent upon osmolality of solution. Total parenteral nutrition must be administered via central venous access.

StorageStore at room temperature of 20°C to 25°C (68°F to 77°F); avoid excessive heat. Do not freeze. Protect from light.

ContraindicationsInborn errors of amino acid metabolism

Warnings/Precautions

Disease-related concerns:

- Heart failure: Use with caution in patients sensitive to volume overload (eg, heart failure, hepatic failure); consider concentrated total parenteral nutrition formula.
- Hepatic impairment: Use caution in protein delivery especially in patients with hepatic encephalopathy; dosage adjustments may be necessary. Consider volume status in patients with hepatic failure, may require concentrated total parenteral nutrition formula.
- Renal impairment: Use with caution in patients with severe renal impairment; dosage adjustments may be necessary depending upon renal replacement therapy options. It is essential to provide adequate calories in a minimal amount of fluid. Monitor fluid balance closely.

Dosage form specific issues:

- Aluminum: Solutions may contain aluminum; toxic levels may occur following prolonged administration in premature neonates or patients with renal impairment.

Other warning/precautions:

- Monitoring: Monitor fluid and electrolyte status.

Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Endocrine & metabolic: Fluid, electrolyte imbalance

Local: Erythema, phlebitis, thrombosis

Renal: Azotemia

Monitoring ParametersGeneral patient monitoring during I.V. nutritional therapy

Bone densitometry: Perform upon initiation of long-term therapy.

Efficacy: Nutrition and outcome parameters should be measured serially.

Electrolytes: Sodium, potassium, chloride, and bicarbonate should be monitored frequently upon initiation and until stable; phosphate should be monitored closely in patients with pulmonary disease.

Glucose: In patients with diabetes or patients with glucose intolerance risk factors, monitor closely. Monitor frequently upon initiation of therapy and with any changes in insulin dose or renal function.

Line site: Monitor for signs and symptoms of infection.

Liver function tests: Monitor periodically.

Neonates: Sodium, calcium, and phosphate should be monitored closely. Frequent (some advise

Refeeding syndrome: Patients at risk should have phosphorus, magnesium, potassium, and glucose levels monitored closely at initiation.

Triglycerides: Before initiation of lipid therapy and at least weekly during therapy.

Vitamin A status: Should be carefully monitored in patients with chronic renal failure.

Monitoring: Lab Tests

Triglycerides: Before initiation of lipid therapy and at least weekly during therapy.

Vitamin A status: Should be carefully monitored in patients with chronic renal failure.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. Peripheral parenteral nutrition and total parenteral nutrition are usually compounded from optimal combinations of macronutrients (water, protein, dextrose, and lipids) and micronutrients (electrolytes, trace elements, and vitamins) to meet the specific nutritional requirements of a patient. Individual hospitals may have designated standard TPN formulas. There are a few commercially-available amino acids with electrolytes solutions; however, these products may not meet an individual's specific nutritional requirements. Consult with nutrition support service to determine adequate formula based upon patient specifics.

Aminocamptothecin

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(a min o camp to THE sin)

Pharmacologic CategoryAntineoplastic Agent, DNA Binding Agent; Enzyme Inhibitor, Topoisomerase I Inhibitor

Use: Unlabeled/InvestigationalPhase II trials: Relapsed lymphoma, refractory breast cancer, nonsmall cell lung cancer, untreated colorectal carcinoma

Dosing: AdultsI.V.: 45-59 mcg/m^2/hour for 72 hours as a continuous infusion; repeat every 2 weeks **or** 35 mcg/m^2/hour as a 72-hour continuous infusion

Dosing: ElderlyRefer to adult dosing.

Calculations

- Body Surface Area: Adults

Administration: I.V.Continuous I.V. infusion

StorageStore ampuls at room temperature. Diluted solutions are stable for 28 hours at room temperature. Undiluted aminocamptothecin should not contact plastic items.

ReconstitutionContents of ampul are added to vial (supplied) containing 24.5 mL of special diluent. Resulting aminocamptothecin concentration is 100 mcg/mL. Further dilutions with special diluent for administration via syringe pump is acceptable. May further dilute with NS if resulting concentration is <1 mcg/mL.

RestrictionsNot available in U.S./Investigational

ContraindicationsHypersensitivity to aminocamptothecin or any component of the formulation

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Adverse ReactionsFrequency not defined.

Central nervous system: Fatigue

Dermatologic: Alopecia

Gastrointestinal: Nausea, vomiting, diarrhea, mucositis, anorexia

Hematologic: Neutropenia (may be dose limiting), thrombocytopenia (reversible, but may be dose limiting), anemia

Oncology: VesicantNo

Oncology: Emetic PotentialModerate (30% to 60%)

Drug Interactions

CarBAMazepine: May decrease the serum concentration of Aminocamptothecin. *Risk C: Monitor therapy*

PHENobarbital: May decrease the serum concentration of Aminocamptothecin. *Risk C: Monitor therapy*

Phenytoin: May decrease the serum concentration of Aminocamptothecin. *Risk C: Monitor therapy*

Valproic Acid: May decrease the serum concentration of Aminocamptothecin. *Risk C: Monitor therapy*

Monitoring ParametersWBC with differential, platelet count

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection: 5 mg ampul

Generic AvailableNo

Mechanism of ActionAminocamptothecin binds to topoisomerase I, stabilizing the cleavable DNA-topoisomerase I complex, resulting in arrest of the replication fork and inhibition of DNA synthesis.

Pharmacodynamics/KineticsRatio of lactone to total drug is 8.7% ± 4.7% because of instability of aminocamptothecin lactone in plasma.

Distribution: V_d: 46-92 L

Metabolism: None identified

Half-life elimination: Terminal: 8-17 hours for total aminocamptothecin

Excretion: Urine (32% of total drug delivered)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Mucositis

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation

Mental Health: Effects on Psychiatric TreatmentMay cause GI side effects; concomitant use with SSRIs, lithium, or valproic acid may produce additive effects; monitor. May cause neutropenia and thrombocytopenia; monitor if using concomitantly with clozapine, valproic acid, and carbamazepine.

Index Terms9-AC; 9-Aminocamptothecin; NSC-603071

Medication Safety Issues

Sound-alike/look-alike issues:

Amicar® may be confused with amikacin, Amikin®, Omacor®

Pronunciation(a mee noe ka PROE ik AS id)

U.S. Brand NamesAmicar®

Pharmacologic CategoryAntifibrinolytic Agent; Hemostatic Agent

Use: Labeled IndicationsTo enhance hemostasis when fibrinolysis contributes to bleeding (causes may include cardiac surgery, hematologic disorders, neoplastic disorders, abruption placentae, hepatic cirrhosis, and urinary fibrinolysis)

Use: Unlabeled/InvestigationalTreatment of traumatic hyphema; control bleeding in thrombocytopenia; control oral bleeding in congenital and acquired coagulation disorders; topical treatment (mouth rinse) of bleeding associated with dental procedures in patients on oral anticoagulant therapy; prevention of perioperative bleeding associated with cardiac surgery

Dosing: Adults

Acute bleeding syndrome: Oral, I.V.: Loading dose: 4-5 g during the first hour, followed by 1 g/hour for 8 hours or until bleeding controlled (maximum daily dose: 30 g)

Control of bleeding in thrombocytopenia (unlabeled use):

Initial: I.V.: 100 mg/kg over 30-60 minutes

Maintenance: Oral: 1-3 g every 6 hours

Control or oral bleeding in congenital and acquired coagulation disorder (unlabeled use): Oral: 50-60 mg/kg every 4 hours

Prevention of dental procedure bleeding in patients on oral anticoagulant therapy (unlabeled use): Oral rinse: Hold 4 g/10 mL in mouth for 2 minutes then spit out. Repeat every 6 hours for 2 days after procedure (Souto, 1996). Concentration and frequency may vary by institution and product availability.

Prevention of perioperative bleeding associated with cardiac surgery (unlabeled use): I.V.: 10 g over 20-30 minutes prior to skin incision, followed by 1-2.5 g/hour (usual dose 2 g/hour) until the end of operation (may continue infusion for 4 hours after protamine reversal of heparin). May add 10 g to cardiopulmonary bypass circuit priming solution.

or

10 g over 20-30 minutes prior to skin incision, followed by 10 g after heparin administration then 10 g at discontinuation of cardiopulmonary bypass prior to protamine reversal of heparin

Traumatic hyphema (unlabeled use): Oral: 100 mg/kg/dose every 4 hours (maximum daily dose: 30 g)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Acute bleeding syndrome (unlabeled use): Oral, I.V.: Loading dose: 100-200 mg/kg during the first hour, followed by continuous infusion at 33.3 mg/kg/hour (I.V.) or 100 mg/kg (oral or I.V.) every 6 hours

Prevention of perioperative bleeding associated with cardiac surgery (unlabeled use): I.V.: 100 mg/kg given over 20-30 minutes after induction and prior to incision, 100 mg/kg during cardiopulmonary bypass, and 100 mg/kg after protamine reversal of heparin

Traumatic hyphema (unlabeled use): Oral: Refer to adult dosing.

Dosing: Renal ImpairmentMay accumulate in patients with decreased renal function.

Administration: I.V.Rapid I.V. injection (IVP) of undiluted solution is not recommended due to possible hypotension, bradycardia, and arrhythmia.

I.V.: Acute bleeding syndrome: Administer loading dose over 1 hour, followed by a continuous infusion

I.V.: Prevention of perioperative bleeding associated with cardiac surgery (unlabeled use): Administer loading dose over 20-30 minutes prior to skin incision, followed by a continuous infusion until the end of operation **or** as 2 additional bolus doses (over 20-30 minutes) given after heparin administration and at discontinuation of cardiopulmonary bypass prior to protamine reversal of heparin.

Administration: I.V. DetailpH: 6.8 (adjusted); range: 6-7.6

StorageStore intact vials, tablets, and syrup at 15°C to 30°C (59°F to 86°F). Do not freeze injection or syrup. Solutions diluted for I.V. use in D_5W or NS to concentrations of 10-100 mg/mL are stable at 4°C (39°F) and 23°C (73°F) for 7 days (Zhang, 1997).

ReconstitutionDilute I.V. solution in D_5W, 0.9% sodium chloride, or Ringer's injection.

CompatibilityStable in D_5W, NS, Ringer's injection

ContraindicationsDisseminated intravascular coagulation (without heparin); evidence of an active intravascular clotting process

Warnings/Precautions

Concerns related to adverse effects:

- Intrarenal obstruction: May occur secondary to glomerular capillary thrombosis or clots in the renal pelvis and ureters; do not use in hematuria of upper urinary tract origin unless possible benefits outweigh risks.
- Skeletal muscle weakness: Ranging from mild myalgias and fatigue to severe myopathy with rhabdomyolysis and acute renal failure has been reported with prolonged use. Monitor CPK; discontinue treatment with a rise in CPK.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment; may accumulate.

Concurrent drug therapy issues:

- Blood products: Do not administer with factor IX complex concentrates or anti-inhibitor coagulant complexes; may increase risk for thrombosis.

Dosage form specific issues:

- Benzyl alcohol: Injection contains benzyl alcohol which has been associated with "gasping syndrome" in neonates.

Other warnings/precautions:

- Appropriate use: Do not administer without a definite diagnosis of laboratory findings indicative of hyperfibrinolysis. Inhibition of fibrinolysis may promote clotting or thrombosis; more likely due to the presence of DIC.
- I.V. administration: Avoid rapid I.V. administration; may induce hypotension, bradycardia, or arrhythmia; rapid injection of undiluted solution is not recommended.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproductive studies have not been conducted.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsFrequency not defined.

Cardiovascular: Arrhythmia, bradycardia, edema, hypotension, intracranial hypertension, peripheral ischemia, syncope, thrombosis

Central nervous system: Confusion, delirium, dizziness, fatigue, hallucinations, headache, malaise, seizure, stroke

Dermatologic: Rash, pruritus

Gastrointestinal: Abdominal pain, anorexia, cramps, diarrhea, GI irritation, nausea, vomiting

Genitourinary: Dry ejaculation

Hematologic: Agranulocytosis, bleeding time increased, leukopenia, thrombocytopenia

Local: Injection site necrosis, injection site pain, injectionsite reactions

Neuromuscular & skeletal: CPK increased, myalgia, myositis, myopathy, rhabdomyolysis (rare), weakness

Ophthalmic: Vision decreased, watery eyes

Otic: Tinnitus

Renal: BUN increased, intrarenal obstruction (glomerular capillary thrombosis), myoglobinuria (rare), renal failure (rare)

Respiratory: Dyspnea, nasal congestion, pulmonary embolism

Miscellaneous: Allergic reaction, anaphylactoid reaction, anaphylaxis

Postmarketing and/or case reports: Hepatic lesion, myocardial lesion

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Anti-inhibitor Coagulant Complex: Antifibrinolytic Agents may enhance the thrombogenic effect of Anti-inhibitor Coagulant Complex. *Risk D: Consider therapy modification*

Factor IX: Aminocaproic Acid may enhance the adverse/toxic effect of Factor IX. Specifically, use of this combination may increase the risk of thrombosis. *Risk X: Avoid combination*

Factor IX Complex (Human): Aminocaproic Acid may enhance the adverse/toxic effect of Factor IX Complex (Human). Specifically, use of this combination may increase the risk of thrombosis. *Risk X: Avoid combination*

Monitoring ParametersFibrinogen, fibrin split products, creatine phosphokinase (with long-term therapy), BUN, creatinine

Nursing: Physical Assessment/MonitoringMonitor laboratory results on a regular basis during therapy. Monitor (teach patient to monitor and report) signs of adverse reactions (eg, bleeding, clotting, thromboembolism, hypotension, or CNS changes).

Monitoring: Lab TestsFibrinogen, fibrin split products, creatine phosphokinase (with long-term therapy), BUN, creatinine

Patient EducationTake oral medication exactly as directed. This medication may cause dizziness and fatigue (use caution when driving or engaging in tasks that require alertness until response to drug is known); hypotension (use caution when rising from a lying or sitting position or climbing stairs); menstrual irregularities, increased body hair, or sexual dysfunction (should reverse when treatment is completed); or nausea or vomiting (small frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report immediately any chest pain; dyspnea; swelling; nosebleed; warmth, swelling, pain, or redness in calves; skin rash; muscle pain or weakness; ringing in ears; or acute abdominal cramping. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: 250 mg/mL (20 mL)

Amicar®: 250 mg/mL (20 mL) [contains benzyl alcohol]

Solution, oral: 1.25 g/5 mL (240 mL, 480 mL)

Syrup:

Amicar®: 1.25 g/5 mL (480 mL) [raspberry flavor]

Tablet [scored]: 500 mg

Amicar®: 500 mg, 1000 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Amicar)

500 mg (30): $91.34

Mechanism of ActionBinds competitively to plasminogen; blocking the binding of plasminogen to fibrin and the subsequent conversion to plasmin, resulting in inhibition of fibrin degradation (fibrinolysis).

Pharmacodynamics/Kinetics

Onset of action: ~1-72 hours

Distribution: Widely through intravascular and extravascular compartments

V_d: Oral: 23 L, I.V.: 30 L

Metabolism: Minimally hepatic

Half-life elimination: ~2 hours

Time to peak: Oral: Within 2 hours

Excretion: Urine (65% as unchanged drug, 11% as metabolite)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported (see Dental Comment)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness

Mental Health: Effects on Psychiatric TreatmentMay cause hypotension which may be exacerbated by psychotropics; rarely may cause seizures; use caution with clozapine and bupropion

Index TermsEACA; Epsilon Aminocaproic Acid

Medication Safety Issues

Sound-alike/look-alike issues:

Cytadren® may be confused with cytarabine

Pronunciation(a mee noe gloo TETH i mide)

U.S. Brand NamesCytadren®

Pharmacologic Category[Antineoplastic Agent, Aromatase Inhibitor](); [Enzyme Inhibitor](); [Hormonal Antagonist, Anti-Adrenal](); [Nonsteroidal Aromatase Inhibitor]()

Use: Labeled IndicationsSuppression of adrenal function in selected patients with Cushing's syndrome

Use: Unlabeled/InvestigationalTreatment of prostate cancer (androgen synthesis inhibitor)

Dosing: Adults **Note:** Glucocorticoid and mineralocorticoid replacement therapy may be necessary.

Adrenal suppression: Oral: 250 mg every 6 hours may be increased in increments of 250 mg/day at 1- to 2-week intervals to a total of 2 g/day

Prostate cancer (unlabeled use): Oral: 250 mg 3 times/day for 3 weeks, then increase to 4 times/day

Dosing: ElderlyRefer to adult dosing.

Administration: OralAdminister every 6 hours to reduce incidence of nausea and vomiting.

StorageStore at controlled room temperature not >30°C (86°F).

ContraindicationsHypersensitivity to aminoglutethimide, glutethimide, or any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Adrenal hypofunction: Adrenocortical hypofunction may occur, particularly under conditions of stress, including acute illness, surgery, and/or trauma. Monitor closely; may require glucocorticoid and mineralocorticoid supplementation. Dexamethasone clearance may be increased by aminoglutethimide and is not recommended for glucocorticoid replacement (hydrocortisone is preferred).
- CNS effects: May cause drowsiness; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hematologic abnormalities: Neutropenia, leukopenia, pancytopenia and agranulocytosis have been reported in patients with Cushing’s syndrome.
- Hypotension: May cause persistent hypotension or orthostatic hypotension due to suppression of aldosterone production.
- Hypothyroidism: Hypothyroidism may occur.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorD

Pregnancy ConsiderationsAdverse effects including reduced implantation, fetal deaths, and teratogenicity have been observed in animal studies. May cause fetal harm if administered to pregnant women. Suspected of causing virilization when given throughout pregnancy.

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsMost adverse effects will diminish in incidence and severity after the first 2-6 weeks

>10%:

Central nervous system: Drowsiness (33%), lethargy

Dermatologic: Skin rash (17%)

Gastrointestinal: Anorexia (13%), nausea (13%),

1% to 10%:

Cardiovascular: Hypotension (3%; occasionally orthostatic), tachycardia (3%)

Central nervous system: Dizziness (5%), headache (5%)

Dermatologic: Pruritus (5%)

Endocrine & metabolic: Adrenocortical insufficiency (3%)

Gastrointestinal: Vomiting (3%)

Hematologic: Anemia (4%)

Neuromuscular & skeletal: Myalgia (3%)

<1%, postmarketing, and/or case reports: Adrenal suppression, agranulocytosis, aldosterone function suppression, alkaline phosphatase increased, allergic alveolitis, allergic reaction, bilirubin increased, cholestatic jaundice, fever, hematocrit decreased, hemoglobin decreased, hemolytic anemia (Coombs' negative), hepatotoxicity, hirsutism, hypercholesterolemia, hyperkalemia, hypersensitivity, hypothyroidism, goiter, interstitial alveolar infiltrates, leukopenia, masculinization of females, neutropenia, pancytopenia, precocious sexual development (in males), pulmonary hypersensitivity, thrombocytopenia, transaminases increased, urticaria

Oncology: Emetic PotentialVery low (<10%)
Metabolism/Transport Effects**Induces** CYP1A2 (strong), 2C19 (strong), 3A4 (strong)
Drug Interactions

Bendamustine: CYP1A2 Inducers (Strong) may decrease the serum concentration of Bendamustine. Concentrations of active metabolites may be increased. *Risk C: Monitor therapy*

Corticosteroids (Systemic): Aminoglutethimide may increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CYP1A2 Substrates: CYP1A2 Inducers (Strong) may increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP2C19 Substrates: CYP2C19 Inducers (Strong) may increase the metabolism of CYP2C19 Substrates. *Risk C: Monitor therapy*

CYP3A4 Substrates: CYP3A4 Inducers (Strong) may increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Digitoxin: Aminoglutethimide may increase the metabolism of Digitoxin. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Nilotinib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Nisoldipine. *Risk X: Avoid combination*

Progestins: Aminoglutethimide may increase the metabolism of Progestins. *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inducers (Strong) may decrease the serum concentration of Ranolazine. *Risk X: Avoid combination*

Sorafenib: CYP3A4 Inducers (Strong) may decrease the serum concentration of Sorafenib. *Risk D: Consider therapy modification*

Tamoxifen: Aminoglutethimide may increase the metabolism of Tamoxifen. *Risk D: Consider therapy modification*

Theophylline Derivatives: Aminoglutethimide may increase the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Aminoglutethimide may increase the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Test InteractionsIncreased alkaline phosphatase (S), AST, TSH; decreased plasma cortisol, thyroxine (S), and urinary aldosterone
Monitoring ParametersThyroid function, CBC, electrolytes, hepatic function; blood pressure

Follow adrenal cortical response by careful monitoring of plasma cortisol until the desired level of suppression is achieved. Mineralocorticoid (fludrocortisone) replacement therapy may be necessary in up to 50% of patients. If glucocorticoid replacement therapy is necessary, 20-30 mg hydrocortisone orally in the morning will replace endogenous secretion.

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other medications patient may be taking. Evaluate results of laboratory tests, therapeutic effectiveness, and adverse reactions (eg, glucocorticoid deficiency [ataxia, hypotension, hypovolemia, somnolence, shock], nausea/vomiting, susceptibility to infection); glucocorticoid and mineralocorticoid replacement therapy may be necessary. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.
Monitoring: Lab TestsThyroid function, CBC, electrolytes, hepatic function. Follow adrenal cortical response by careful monitoring of plasma cortisol until the desired level of suppression is achieved.
Patient EducationDo not take any new prescription or OTC medications or herbal products during therapy without consulting prescriber. Take exactly as directed; may be taken with food to reduce incidence of nausea. May cause drowsiness or dizziness (avoid driving or engaging in tasks that require alertness until response to drug is known); postural hypotension (use caution when changing position from lying or sitting to standing or when climbing stairs); muscle or joint pain (consult prescriber for analgesic); nausea or vomiting (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help). Report skin rash, persistent or unresolved lethargy, fatigue, nausea, vomiting, loss of appetite, easy bruising or bleeding, change in frequency or color of urine or stool, severe mood swings, palpitations, respiratory difficulty, or other adverse reactions. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication. Consult prescriber for appropriate barrier contraceptive measures. Breast-feeding is not recommended.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet [scored]:

Cytadren®: 250 mg

Generic AvailableNo
Pricing: U.S. (www.drugstore.com)

Tablets (Cytadren)

250 mg (30): $47.99

Mechanism of Action Inhibits steroid synthesis by blocking the enzymatic conversion of cholesterol to delta-5-pregnenolone, thereby reducing the synthesis of adrenal glucocorticoids, mineralocorticoids, estrogens, aldosterone, and androgens. Aminoglutethimide is a first-generation aromatase inhibitor.

Pharmacodynamics/Kinetics

Onset of action: Adrenal suppression: 3-5 days

Duration: Adrenal gland synthesis returns within ~72 hours of discontinuation

Absorption: Rapid and complete

Protein binding, plasma: 20% to 25%

Metabolism: Major metabolite is N-acetylaminoglutethimide; induces its own metabolism

Half-life elimination: 11-14 hours; shorter following multiple doses

Time to peak, plasma: 1.5 hours

Excretion: Urine (34% to 54% as unchanged drug, 25% as metabolites)

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Nausea and orthostatic hypotension

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status Drowsiness is common

Mental Health: Effects on Psychiatric Treatment May cause hypotension which may be exacerbated by psychotropics; may cause bone marrow suppression; use caution with clozapine and carbamazepine; propranolol may increase the risk of drowsiness

Index Terms BA-16038; Elipten

Jump To Field (Select Field Name)

Pronunciation(a MEE noh lev yoo lin ik AS id)

U.S. Brand NamesLevulan® Kerastick®

Canadian Brand NamesLevulan®

Pharmacologic CategoryPhotosensitizing Agent, Topical; Topical Skin Product

Use: Labeled IndicationsTreatment of minimally to moderately thick actinic keratoses (grade 1 or 2) of the face or scalp; to be used in conjunction with blue light illumination

Dosing: AdultsActinic keratoses: Topical: Apply to actinic keratoses (**not** perilesional skin) followed 14-18 hours later by blue light illumination. Application/treatment may be repeated at a treatment site after 8 weeks.

Dosing: ElderlyRefer to adult dosing.

Administration: TopicalDab lesion gently with wet applicator tip. Do not apply to periorbital area, ocular tissue, or mucosal surfaces. Allow to dry, then reapply to same lesion. Apply to either scalp or facial lesions, but not to both simultaneously. Follow application with blue light exposure in 14-18 hours.

StorageStore at 25°C (77°F). Once prepared, the topical solution should be used immediately and application must be completed within 2 hours of solution preparation.

ReconstitutionPrepare solution by holding applicator tube with cap pointing up. Apply finger pressure to “Position A” on cardboard sleeve to crush ampul containing solution vehicle. Apply finger pressure to “Position B” to crush ampul containing aminolevulinic acid powder. Shake gently for at least 3 minutes to dissolve; point applicator cap away from face while shaking tube. Remove cap; dab dry applicator tip on gauze pad until wet with solution.

ContraindicationsHypersensitivity to aminolevulinic acid or any component of the formulation; individuals with cutaneous photosensitivity at wavelengths of 400-450 nm; porphyria; allergy to porphyrins

Warnings/Precautions

Concerns related to adverse effects:

- Photosensitivity: Treatment site will become photosensitive following application. Patients should be instructed to avoid exposure to sunlight, bright indoor lights, or tanning beds during the period prior to blue light treatment.

Special populations:

- Patients with coagulation defects: Has not been tested in individuals with coagulation defects (acquired or inherited).

Other warnings/precautions:

- Appropriate use: For external use only. Do not apply to eyes or mucous membranes. Should be applied by a qualified health professional to avoid application to perilesional skin.

Geriatric ConsiderationsComplaints by elderly with skin lesions increase with age. Common skin lesions are actinic keratoses, squamous cell carcinoma, and basal cell carcinoma. Although other agents for treatment are commonly used for these diseases, this agent is an alternative agent.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted, and there are no adequate and well-controlled studies in pregnant women. Use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsTransient stinging, burning, itching, erythema, and edema result from the photosensitizing properties of this agent. Symptoms subside between 1 minute and 24 hours after turning off the blue light illuminator. Severe stinging or burning was reported in at least 50% of patients from at least 1 lesional site treatment.

>10%: Dermatologic: Severe stinging or burning (50%), scaling of the skin/crusted skin (64% to 71%), hyper-/hypopigmentation (22% to 36%), itching (14% to 25%), erosion (2% to 14%)

1% to 10%:

Central nervous system: Dysesthesia (up to 2%)

Dermatologic: Skin ulceration (2% to 4%), vesiculation (4% to 5%), pustular drug eruption (up to 4%), skin disorder (5% to 12%)

Hematologic: Bleeding/hemorrhage (2% to 4%)

Local: Wheal/flare (2% to 7%), local pain (1%), tenderness (1% to 2%), edema (1%), scabbing (up to 2%), excoriation (1%)

Drug InteractionsThere are no known significant interactions.

Nursing: Physical Assessment/MonitoringSee Contraindications and Warnings/Precautions for safe use. Assess other medications patient may be taking for possible increase photosensitizing (see Drug Interactions). Monitor for therapeutic effect and adverse reactions (see Adverse Reactions and Overdose/Toxicology). Assess knowledge/teach patient appropriate use, interventions to reduce side effects, and adverse reactions to report (see Patient Education). **Pregnancy risk factor C** - benefits of use should outweigh possible risks. Note breast-feeding caution.

Patient EducationThis medication is for external use only; do not allow any solution to contact eyes, mouth, or nasal membranes. Follow exact directions for application (see below). You may experience stinging, burning, itching, swelling, or pain after turning off blue light illuminator. If these or any other adverse skin effects last longer than 24 hours, notify prescriber. Report immediately any indications of unusual bleeding or bruising. Solution should be used immediately following preparation of solution according to directions. Apply to clean, dry skin with applicator, directly to lesions. Blue light exposure should follow between 14-18 hours after the application. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Powder for topical solution:

Levulan® Kerastick®: 20% (6s) [2-component system containing aminolevulinic acid hydrochloride 354 mg (powder) and diluent containing ethanol 48% (1.5 mL) packaged together in an applicator tube]

Generic AvailableNo

ManufacturerDUSA Pharmaceuticals, Inc

Mechanism of ActionAminolevulinic acid is a metabolic precursor of protoporphyrin IX (PpIX), which is a photosensitizer. Photosensitization following application of aminolevulinic acid topical solution occurs through the metabolic conversion to PpIX. When exposed to light of appropriate wavelength and energy, accumulated PpIX produces a photodynamic reaction.

Pharmacodynamics/Kinetics

PpIX:

Peak fluorescence intensity: 11 hours ± 1 hour

Half-life, mean clearance for lesions: 30 ± 10 hours

Pharmacotherapy PearlsUse in conjunction with the BLU-U™ Blue Light Photodynamic Therapy Illuminator.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Bleeding/hemorrhage (limited to application/treatment site).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsAminolevulinic Acid Hydrochloride

Medication Safety Issues

Sound-alike/look-alike issues:

Aminophylline may be confused with amitriptyline, ampicillin

Pronunciation(am in OFF i lin)

Canadian Brand NamesPhyllocontin®; Phyllocontin®-350

Pharmacologic CategoryTheophylline Derivative

Use: Labeled IndicationsBronchodilator in reversible airway obstruction due to asthma or COPD; increase diaphragmatic contractility

Use: Unlabeled/InvestigationalReversal of adenosine-, dipyridamole-, or regadenoson-induced adverse reactions (eg, angina, hypotension) during nuclear cardiac stress testing

Dosing: Adults

Treatment of acute bronchospasm: I.V.:

Loading dose (in patients not currently receiving aminophylline or theophylline): 6 mg/kg (based on aminophylline) administered I.V. over 20-30 minutes; administration rate should not exceed 25 mg/minute (aminophylline)

Approximate I.V. maintenance dosages: Based upon **continuous infusions**; bolus dosing may be determined by multiplying the hourly infusion rate by 24 hours and dividing by the desired number of doses/day

Smoker: 0.8 mg/kg/hour

Nonsmoker: 0.5 mg/kg/hour

Older patients and patients with cor pulmonale: 0.3 mg/kg/hour

Patients with congestive heart failure: 0.1-0.2 mg/kg/hour

Dosage should be adjusted according to serum level measurements during the first 12- to 24-hour period.

Reversal of adenosine-, dipyridamole-, or regadenoson-induced adverse reactions (eg, angina, hypotension) during nuclear cardiac stress testing (unlabeled use): I.V.: 50-250 mg administered over 30-60 seconds, repeat as necessary

Note: Since adenosine-induced side effects are short lived after discontinuation of the infusion, aminophylline administration is only very rarely required.

Bronchodilator: Oral: Initial: 380 mg/day (equivalent to theophylline 300 mg/day) in divided doses every 6-8 hours; may increase dose after 3 days; maximum dose: 928 mg/day (equivalent to theophylline 800 mg/day)

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Treatment of acute bronchospasm: I.V.:

Loading dose: Patients not currently receiving aminophylline or theophylline: 6 mg/kg (based on aminophylline) administered I.V. over 20-30 minutes; administration rate should not exceed 25 mg/minute (aminophylline)

Approximate I.V. maintenance dosages: Based upon **continuous infusions**; bolus dosing (often used in children <6 months of age) may be determined by multiplying the hourly infusion rate by 24 hours and dividing by the desired number of doses/day

6 weeks to 6 months: 0.5 mg/kg/hour

6 months to 1 year: 0.6-0.7 mg/kg/hour

1-9 years: 1 mg/kg/hour

9-16 years: Refer to adult dosing.

Dosage should be adjusted according to serum level measurements during the first 12- to 24-hour period.

Bronchodilator: Oral: Children ≥45 kg: Refer to adult dosing.

Administration: I.M.Not recommended

Administration: I.V.Dilute with I.V. fluid to a concentration of 1 mg/mL and infuse over 20-30 minutes; maximum concentration: 25 mg/mL; maximum rate of infusion: 0.36 mg/kg/minute, and no greater than 25 mg/minute. I.M. administration is not recommended. Should be administered around-the-clock rather than 4 times/day, 3 times/day, etc (ie, 12-6-12-6, not 9-1-5-9) to promote less variation in peak and trough serum levels.

For reversal of adenosine-, dipyridamole-, or regadenoson-induced adverse events during nuclear cardiac stress testing, administer I.V. undiluted over 30-60 seconds, repeat as necessary. Since adenosine-induced side effects are short lived after discontinuation of the infusion, aminophylline administration is only very rarely required.

Administration: OralShould be administered around-the-clock rather than 4 times/day, 3 times/day, etc (ie, 12-6-12-6, not 9-1-5-9) to promote less variation in peak and trough serum levels.
StorageDo not use solutions if discolored or if crystals are present.
CompatibilityStable in dextran 6% in D_5W, dextran 6% in NS, D_5LR, D_5NS, $D_5{}^{1}/_{2}$NS, $D_5{}^{1}/_{4}$NS, D_5W, D_{10}W, D_{20}W, LR, ${}^{1}/_{2}$NS, NS; **variable stability (consult detailed reference)** in fat emulsion 10%.

Y-site administration: Compatible: Allopurinol, amifostine, amphotericin B cholesteryl sulfate complex, aztreonam, ceftazidime, cimetidine, cladribine, docetaxel, doxorubicin liposome, enalaprilat, esmolol, etoposide, famotidine, filgrastim, fluconazole, fludarabine, foscarnet, gatifloxacin, gemcitabine, granisetron, heparin with hydrocortisone sodium succinate, inamrinone, labetalol, levofloxacin, linezolid, melphalan, meropenem, morphine, paclitaxel, pancuronium, piperacillin/tazobactam, potassium chloride, propofol, ranitidine, remifentanil, sargramostim, tacrolimus, teniposide, thiotepa, tolazoline, vecuronium, vitamin B complex with C. **Incompatible:** Amiodarone, ciprofloxacin, clarithromycin, dobutamine, hydralazine, ondansetron, vinorelbine, warfarin. **Variable (consult detailed reference):** Cisatracurium, diltiazem.

Compatibility in syringe: Compatible: Heparin, metoclopramide, pentobarbital, thiopental. **Incompatible:** Doxapram.

Compatibility when admixed: Compatible: Amobarbital, bretylium, calcium gluconate, chloramphenicol, cimetidine, dexamethasone, diphenhydramine, dopamine, erythromycin lactobionate, esmolol, floxacillin, flumazenil, furosemide, heparin, hydrocortisone sodium succinate, lidocaine, mephentermine, meropenem, methyldopate, metronidazole with sodium bicarbonate, nitroglycerin, pentobarbital, phenobarbital, potassium chloride, ranitidine, sodium bicarbonate, terbutaline. **Incompatible:** Atracurium, bleomycin, cefepime, ceftazidime, ceftriaxone, chlorpromazine, ciprofloxacin, clindamycin, dobutamine, doxorubicin, epinephrine, hydralazine, hydrocortisone sodium succinate with cephalothin sodium, hydroxyzine, insulin (regular), isoproterenol, levorphanol, meperidine, morphine, norepinephrine, papaverine with trimecaine, penicillin G potassium, pentazocine, prochlorperazine edisylate, prochlorperazine mesylate, promazine, promethazine, vitamin B complex with C. **Variable (consult detailed reference):** Amikacin, ascorbic acid, corticotropin, dimenhydrinate, methylprednisolone sodium succinate, nafcillin, procaine, vancomycin, verapamil, zinc.

ContraindicationsHypersensitivity to theophylline, ethylenediamine, or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Theophylline toxicity: If a patient develops signs and symptoms of theophylline toxicity (eg, persistent, repetitive vomiting), a serum level should be measured and subsequent doses held.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with hypertension or cardiac arrhythmias (excluding bradyarrhythmias).

- Hyperthyroidism: Use with caution in patients with hyperthyroidism.

- Peptic ulcer disease: Use with caution in patient with peptic ulcer disease.

- Seizure disorder: Use with caution in patients with a history of seizure disorder.

Other warnings/precautions:

- Dosage adjustments: Due to potential saturation of theophylline clearance at serum levels within (or in some patients less than) the therapeutic range, dosage adjustment should be made in small increments (maximum: 25% reduction).

- Monitoring: Due to wide interpatient variability, theophylline serum level measurements must be used to optimize therapy and prevent serious toxicity.

Geriatric ConsiderationsAlthough there is a great intersubject variability for half-lives of methylxanthines (2-10 hours), elderly, as a group, have slower hepatic clearance. Therefore, use lower initial doses and monitor closely for response and adverse reactions. Additionally, elderly patients are at greater risk for toxicity due to concomitant disease (eg, congestive heart failure, arrhythmias), and drug use (eg, cimetidine, ciprofloxacin, etc).
Pregnancy Risk FactorC
Pregnancy ConsiderationsTheophylline crosses the placenta; adverse effects may be seen in the newborn. Theophylline metabolism may change during pregnancy; monitor serum levels.
LactationEnters breast milk/compatible (AAP rates “compatible”)
Breast-Feeding ConsiderationsIrritability may be observed in the nursing infant.
Adverse Reactions

Uncommon at serum theophylline concentrations ≤15 mcg/mL

1% to 10%:

Cardiovascular: Tachycardia

Central nervous system: Nervousness, restlessness

Gastrointestinal: Nausea, vomiting

<1%: Insomnia, irritability, seizure, skin rash, gastric irritation, tremor, allergic reactions

Metabolism/Transport Effects**Substrate** of CYP1A2 (major), 2E1 (minor), 3A4 (minor)

Drug Interactions

Adenosine: Theophylline Derivatives may diminish the therapeutic effect of Adenosine. *Risk D: Consider therapy modification*

Allopurinol: May increase the serum concentration of Theophylline Derivatives. *Risk C: Monitor therapy*

Aminoglutethimide: May increase the metabolism of Theophylline Derivatives. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Theophylline Derivatives. *Risk C: Monitor therapy*

Benzodiazepines: Theophylline Derivatives may diminish the therapeutic effect of Benzodiazepines. *Risk D: Consider therapy modification*

Beta-Blockers (Beta1 Selective): May diminish the bronchodilatory effect of Theophylline Derivatives. This is true at higher beta-blockers doses where cardioselectivity is lost. *Risk C: Monitor therapy*

Beta-Blockers (Nonselective): May diminish the bronchodilatory effect of Theophylline Derivatives. *Risk D: Consider therapy modification*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Theophylline Derivatives. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Theophylline Derivatives. *Risk D: Consider therapy modification*

CYP1A2 Inducers (Strong): May increase the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Moderate): May decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP1A2 Inhibitors (Strong): May decrease the metabolism of CYP1A2 Substrates. *Risk D: Consider therapy modification*

Disulfiram: May increase the serum concentration of Theophylline Derivatives. *Risk C: Monitor therapy*

Fluvoxamine: May decrease the metabolism of Theophylline Derivatives. *Risk D: Consider therapy modification*

Interferons: May decrease the metabolism of Theophylline Derivatives. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Isoniazid: May decrease the metabolism of Theophylline Derivatives. *Risk D: Consider therapy modification*

Lithium: Theophylline Derivatives may increase the excretion of Lithium. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Theophylline Derivatives. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin; Telithromycin. *Risk D: Consider therapy modification*

Mexiletine: May decrease the metabolism of Theophylline Derivatives. *Risk D: Consider therapy modification*

Moricizine: May increase the metabolism of Theophylline Derivatives. *Risk C: Monitor therapy*

Pentoxifylline: May increase the serum concentration of Theophylline Derivatives. *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of Theophylline Derivatives. Theophylline Derivatives may decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the serum concentration of Theophylline Derivatives. **Exceptions:** Amprenavir; Fosamprenavir. *Risk C: Monitor therapy*

Quinolone Antibiotics: May decrease the metabolism of Theophylline Derivatives. Ciprofloxacin and enoxacin are of greatest concern. Theophylline/quinolone therapy might augment the seizure-producing potential of each of the individual agents. **Exceptions:** Gatifloxacin; Gemifloxacin; Levofloxacin; Lomefloxacin; Moxifloxacin; Nalidixic Acid; Sparfloxacin; Trovafloxacin. *Risk D: Consider therapy modification*

Regadenoson: Aminophylline may diminish the vasodilatory effect of Regadenoson. *Risk D: Consider therapy modification*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tacrine: May decrease the metabolism of Theophylline Derivatives. *Risk C: Monitor therapy*

Thiabendazole: May decrease the metabolism of Theophylline Derivatives. *Risk D: Consider therapy modification*

Thyroid Products: May increase the metabolism of Theophylline Derivatives. *Risk C: Monitor therapy*

Ticlopidine: May decrease the metabolism of Theophylline Derivatives. *Risk C: Monitor therapy*

Zafirlukast: Theophylline Derivatives may decrease the serum concentration of Zafirlukast. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Food does not appreciably affect absorption. Avoid extremes of dietary protein and carbohydrate intake. Changes in diet may affect the elimination of theophylline; charcoal-broiled foods may increase elimination, reducing half-life by 50%.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as dihydrate: 25 mg/mL (10 mL, 20 mL)

Injection, solution, as dihydrate [preservative free]: 25 mg/mL (10 mL, 20 mL)

Tablet, as dihydrate: 100 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Aminophylline)

100 mg (30): $12.99

200 mg (90): $19.00

Mechanism of ActionCauses bronchodilatation, diuresis, CNS and cardiac stimulation, and gastric acid secretion by blocking phosphodiesterase which increases tissue concentrations of cyclic adenine monophosphate (cAMP) which in turn promote catecholamine stimulation of lipolysis, glycogenolysis, and gluconeogenesis and induce release of epinephrine from adrenal medulla cells

Pharmacodynamics/Kinetics

Theophylline:

Absorption: Oral: Dosage form dependent

Distribution: 0.45 L/kg based on ideal body weight

Protein binding: 40%, primarily to albumin

Metabolism: Children >1 year and Adults: Hepatic; involves CYP1A2, 2E1, and 3A4; forms active metabolites (caffeine and 3-methylxanthine)

Half-life elimination: Highly variable and dependent upon age, liver function, cardiac function, lung disease, and smoking history

Time to peak, serum:

Oral: Immediate release: 1-2 hours

I.V.: Within 30 minutes

Excretion: Children >3 months and Adults: Urine (10% as unchanged drug)

Related Information

- Asthma

Pharmacotherapy PearlsAminophylline is a 2:1 complex of theophylline and ethylenediamine.

Dental Health: Effects on Dental TreatmentPrescribe erythromycin products with caution to patients taking theophylline products. Erythromycin will delay the normal metabolic inactivation of theophyllines leading to increased blood levels; this has resulted in nausea, vomiting, and CNS restlessness.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause nervousness or restlessness

Mental Health: Effects on Psychiatric TreatmentCarbamazepine and barbiturates may decrease aminophylline levels; disulfiram and propranolol may increase aminophylline levels

Cardiovascular ConsiderationsTheophylline results in significant tachycardia and, at higher doses, may impair ventricular rate control in patients with atrial fibrillation. This is particularly a concern since patients with underlying chronic obstructive lung disease often have coexisting atrial fibrillation. Aminophylline can be used to treat patients who have adverse hemodynamic responses to adenosine, dipyridamole or regadenoson, when used during cardiovascular stress testing. Since adenosine-induced side effects are short lived after discontinuation of the infusion, aminophylline administration is only very rarely required.

Index TermsTheophylline Ethylenediamine

Pronunciation(a mee noe sal i SIL ik AS id)
U.S. Brand NamesPaser®
Pharmacologic CategorySalicylate
Use: Labeled IndicationsAdjunctive treatment of tuberculosis used in combination with other antitubercular agents
Use: Unlabeled/InvestigationalCrohn's disease
Dosing: Adults

Tuberculosis: Oral: 150 mg/kg/day in 2-3 equally divided doses

Crohn's disease (unlabeled use): 1.5 g/day

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricTuberculosis: Oral: 200-300 mg/kg/day in 3-4 equally divided doses
Dosing: Renal Impairment

Cl_{cr} 10-50 mL/minute: Administer 50% to 75% of dose.

Cl_{cr} <10 mL/minute: Administer 50% of dose.

Administer after hemodialysis: Administer 50% of dose.

Continuous arteriovenous hemofiltration: Dose for Cl_{cr} <10 mL/minute

Dosing: Hepatic ImpairmentUse with caution
Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralDo not use granules if packet is swollen or if granules are discolored (ie, brown or purple). Granules may be sprinkled on applesauce or yogurt (do not chew) or suspended in tomato or orange juice.
Dietary ConsiderationsMay be taken with food.
StoragePrior to dispensing, store granules below 15°C (59°F). Once dispensed, packets may be stored at room temperature for short periods of time. Do not use if packet is swollen or if granules are dark brown or purple.
ContraindicationsHypersensitivity to aminosalicylic acid or any component of the formulation
Allergy Considerations

- 5-Aminosalicylic Acid Derivative Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Salicylate sensitivity: Patients with sensitivity to tartrazine dyes, nasal polyps, and asthma may have an increased risk of salicylate sensitivity.

Disease-related concerns:

- Gastric ulcer: Use with caution in patients with gastric ulcer.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Renal impairment: Use with caution in patients with renal impairment.

Geriatric ConsiderationsElderly may require a lower recommended dose.
Pregnancy Risk FactorC
Pregnancy ConsiderationsTeratogenic effects have been reported in animals, however, adequate studies have not been done in humans. Use during pregnancy only if clearly needed.
LactationEnters breast milk/not recommended
Adverse ReactionsFrequency not defined.

Cardiovascular: Pericarditis, vasculitis

Central nervous system: Encephalopathy, fever

Dermatologic: Skin eruptions

Endocrine & metabolic: Goiter (with or without myxedema), hypoglycemia

Gastrointestinal: Abdominal pain, diarrhea, nausea, vomiting

Hematologic: Agranulocytosis, anemia (hemolytic), leukopenia, thrombocytopenia

Hepatic: Hepatitis, jaundice

Ocular: Optic neuritis

Respiratory: Eosinophilic pneumonia

Drug Interactions

ACE Inhibitors: Salicylates may diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Anticoagulants: Salicylates may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May enhance the anticoagulant effect of Salicylates. *Risk C: Monitor therapy*

Carbonic Anhydrase Inhibitors: Salicylates may enhance the adverse/toxic effect of Carbonic Anhydrase Inhibitors. Salicylate toxicity might be enhanced by this same combination. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Salicylates may enhance the adverse/toxic effect of Corticosteroids (Systemic). These specifically include gastrointestinal ulceration and bleeding. Corticosteroids (Systemic) may decrease the serum concentration of Salicylates. Withdrawal of corticosteroids may result in salicylate toxicity. *Risk C: Monitor therapy*

Drotrecogin Alfa: Salicylates may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Ginkgo Biloba: May enhance the antiplatelet effect of Salicylates. *Risk D: Consider therapy modification*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk D: Consider therapy modification*

Methotrexate: Salicylates may increase the serum concentration of Methotrexate. Salicylate doses used for prophylaxis of cardiovascular events are not likely to be of concern. *Risk D: Consider therapy modification*

NSAID (Nonselective): May enhance the adverse/toxic effect of Salicylates. An increased risk of bleeding may be associated with use of this combination. NSAID (Nonselective) may diminish the cardioprotective effect of Salicylates. Salicylates may decrease the serum concentration of NSAID (Nonselective). **Exceptions:** Diclofenac. *Risk D: Consider therapy modification*

Salicylates: May enhance the anticoagulant effect of other Salicylates. *Risk C: Monitor therapy*

Sulfonylureas: Salicylates may enhance the hypoglycemic effect of Sulfonylureas. Of concern with regular, higher doses of salicylates, not sporadic, low doses. *Risk C: Monitor therapy*

Thrombolytic Agents: Salicylates may enhance the adverse/toxic effect of Thrombolytic Agents. An increased risk of bleeding may occur. *Risk C: Monitor therapy*

Treprostinil: May enhance the adverse/toxic effect of Salicylates. Bleeding may occur. *Risk C: Monitor therapy*

Uricosuric Agents: Salicylates may diminish the therapeutic effect of Uricosuric Agents. Specifically, uricosuria. *Risk C: Monitor therapy*

Valproic Acid: Salicylates may increase the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Varicella Virus-Containing Vaccines: Salicylates may enhance the adverse/toxic effect of Varicella Virus-Containing Vaccines. Reye's Syndrome may develop. *Risk D: Consider therapy modification*

Vitamin K Antagonists (eg, warfarin): Salicylates may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Nursing: Physical Assessment/MonitoringMonitor for effectiveness of treatment and indications of adverse effects.

Patient EducationMay be taken with food; may sprinkle on applesauce or yogurt, or suspend in tomato or orange juice. Do not use granules if discolored (brown or purple) or if packet is swollen; see pharmacist for new prescription. Do not stop taking without consulting prescriber. Report persistent sore throat, fever, unusual bleeding or bruising, persistent nausea or vomiting, or abdominal pain. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Granules, delayed release:

Paser®: 4 g/packet (30s) [sugar free]

Generic AvailableNo

ManufacturerJacobus Pharmaceutical Co Inc

Mechanism of ActionAminosalicylic acid (PAS) is a highly-specific bacteriostatic agent active against *M. tuberculosis*. Structurally related to para-aminobenzoic acid (PABA) and its mechanism of action is thought to be similar to the sulfonamides, a competitive antagonism with PABA; disrupts plate biosynthesis in sensitive organisms.

Pharmacodynamics/Kinetics

Absorption: Readily, >90%

Protein binding: 50% to 60%

Metabolism: Hepatic (>50%) via acetylation

Half-life elimination: Reduced with renal impairment

Time to peak, serum: 6 hours

Excretion: Urine (>80% as unchanged drug and metabolites)

Dental Health: Effects on Dental TreatmentNSAID formulations are known to reversibly decrease platelet aggregation via mechanisms different than observed with aspirin. The dentist should be aware of the potential of abnormal coagulation. Caution should also be exercised in the use of NSAIDs in patients already on anticoagulant therapy with drugs such as warfarin (Coumadin®).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay cause bone marrow suppression; use caution with clozapine and carbamazepine

Index Terms4-Aminosalicylic Acid; Aminosalicylate Sodium; Para-Aminosalicylate Sodium; PAS; Sodium PAS

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Special Alerts

Simvastatin and Amiodarone Concurrent Therapy: Dose-Related Increased Risk of Rhabdomyolysis - August 2008

The U.S. Food and Drug Administration (FDA) has issued an alert to remind practitioners of a dose-related increased risk of rhabdomyolysis when amiodarone is used concurrently with simvastatin at doses >20 mg. If patients require simvastatin >20 mg, an alternative HMG-CoA reductase inhibitor (statin) should be used. This information has previously been incorporated into the Lexi-Comp monograph.

Additional information may be found at http://www.fda.gov/cder/drug/InfoSheets/HCP/simvastatin_amiodaroneHCP.htm

Medication Safety Issues

Sound-alike/look-alike issues:

Amiodarone may be confused with aMILoride, amrinone

Cordarone® may be confused with Cardura®, Cordran®

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(a MEE oh da rone)

U.S. Brand NamesCordarone®; Pacerone®

Canadian Brand NamesAlti-Amiodarone; Amiodarone Hydrochloride for Injection®; Apo-Amiodarone®; Cordarone®; Dom-Amiodarone; Gen-Amiodarone; Novo-Amiodarone; PHL-Amiodarone; PMS-Amiodarone; Ratio-Amiodarone; Ratio-Amiodarone I.V.; Sandoz-Amiodarone

Pharmacologic CategoryAntiarrhythmic Agent, Class III

Use: Labeled IndicationsManagement of life-threatening recurrent ventricular fibrillation (VF) or hemodynamically-unstable ventricular tachycardia (VT) refractory to other antiarrhythmic agents or in patients intolerant of other agents used for these conditions

Use: Unlabeled/Investigational

Cardiac arrest with persistent ventricular tachycardia (VT) or ventricular fibrillation (VF) if defibrillation, CPR, and vasopressor administration have failed (ACLS/PALS guidelines)

Control of hemodynamically-stable VT, polymorphic VT with a normal QT interval, or wide-complex tachycardia of uncertain origin (ACLS/PALS guidelines)

Control of rapid ventricular rate due to accessory pathway conduction in pre-excited atrial arrhythmias (ACLS guidelines)

Heart rate control in patients with atrial fibrillation and heart failure [no accessory pathway] (ACC/AHA/ESC Practice Guidelines)

Paroxysmal supraventricular tachycardia (SVT)

Prevention of postoperative atrial fibrillation during cardiothoracic surgery

Pharmacologic adjunct to ICD therapy to suppress symptomatic ventricular tachyarrhythmias in otherwise optimally-treated patients with heart failure (ACC/AHA/ESC Practice Guidelines)

Pharmacologic conversion of atrial fibrillation to normal sinus rhythm; maintenance of normal sinus rhythm

Dosing: Adults**Note:** Lower loading and maintenance doses are preferable in women and all patients with low body weight.

Ventricular arrhythmias: Oral: 800-1600 mg/day in 1-2 doses for 1-3 weeks, then 600-800 mg/day in 1-2 doses for 1 month; maintenance: 400 mg/day; lower doses are recommended for supraventricular arrhythmias.

Breakthrough VF or VT: I.V.: 150 mg supplemental doses in 100 mL D_5W over 10 minutes

Pulseless VF or VT: I.V. push: Initial: 300 mg in 20-30 mL NS or D_5W; if VF or VT recurs, supplemental dose of 150 mg followed by infusion of 1 mg/minute for 6 hours, then 0.5 mg/minute (maximum daily dose: 2.1 g)

I.V. to oral therapy conversion: Use the following as a guide:

<1 week I.V. infusion: 800-1600 mg/day

1- to 3-week I.V. infusion: 600-800 mg/day

>3 week I.V. infusion: 400 mg

Recommendations for conversion to intravenous amiodarone after oral administration: During long-term amiodarone therapy (ie, ≥4 months), the mean plasma-elimination half-life of the active metabolite of amiodarone is 61 days. Replacement therapy may not be necessary in such patients if oral therapy is discontinued for a period <2 weeks, since any changes in serum amiodarone concentrations during this period may **not** be clinically significant.

Unlabeled uses:

Atrial fibrillation prophylaxis following open heart surgery (unlabeled use):Note: A variety of regimens have been used in clinical trials, including oral and intravenous regimens:

Oral: Starting in postop recovery, 400 mg twice daily for up to 7 days. Alternative regimen of amiodarone: 600 mg/day for 7 days prior to surgery, followed by 200 mg/day until hospital discharge, has also been shown to decrease the risk of postoperative atrial fibrillation. **Note:** A variety of regimens have been used in clinical trials.

I.V.: Starting at postop recovery, 1000 mg infused over 24 hours for 2 days has been shown to reduce the risk of postoperative atrial fibrillation. **Note:** A variety of regimens have been used in clinical trials.

Atrial fibrillation pharmacologic cardioversion (ACC/AHA/ESC Practice Guidelines) (unlabeled use):

Oral: Inpatient: 1.2-1.8 g/day in divided doses until 10 g total, then 200-400 mg/day maintenance. **Note:** Other regimens have been described and may be used clinically (Roy, 2000):

400 mg 3 times/day for 5-7 days, then 400 mg/day for 1 month, then 200 mg/day

or

10 mg/kg/day for 14 days, followed by 300 mg/day for 4 weeks, followed by maintenance dosage of 100-200 mg/day

I.V.: 5-7 mg/kg over 30-60 minutes, then 1.2-1.8 g/day continuous infusion or in divided oral doses until 10 g total. Maintenance: See oral dosing.

Recurrent atrial fibrillation (unlabeled use): No standard regimen defined; examples of regimens include: Oral: Initial: 10 mg/kg/day for 14 days; followed by 300 mg/day for 4 weeks, followed by maintenance dosage of 100-200 mg/day (Roy D, 2000). Other regimens have been described and are used clinically (ie, 400 mg 3 times/day for 5-7 days, then 400 mg/day for 1 month, then 200 mg/day).

Stable VT or SVT (unlabeled use): I.V.: First 24 hours: 1050 mg according to following regimen

Step 1: 150 mg (100 mL) over first 10 minutes (mix 3 mL in 100 mL D_5W)

Step 2: 360 mg (200 mL) over next 6 hours (mix 18 mL in 500 mL D_5W): 1 mg/minute

Step 3: 540 mg (300 mL) over next 18 hours: 0.5 mg/minute

Note: After the first 24 hours: 0.5 mg/minute utilizing concentration of 1-6 mg/mL

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Arrhythmias (unlabeled use):

Loading dose: Oral: 10-20 mg/kg/day in 1-2 doses for 4-14 days or until adequate control of arrhythmia or prominent adverse effects occur; alternative loading dose in children <1 year: 600-800 mg/1.73 m^2/day in 1-2 divided doses/day.

Maintenance dose: Oral: Dose may be reduced to 5 mg/kg/day for several weeks (or 200-400 mg/1.73 m^2/day given once daily); if no recurrence of arrhythmia, dose may be further reduced to 2.5 mg/kg/day; maintenance doses may be given 5-7 days/week.

Arrhythmias (unlabeled use, dosing based on limited data):

Loading dose: I.V.: 5 mg/kg over 30 minutes; may repeat up to 3 times if no response.

Maintenance dose: I.V.: 2-20 mg/kg/day (5-15 mcg/kg/minute) by continuous infusion.

Note: I.V. administration at low flow rates (potentially associated with use in pediatrics) may result in leaching of plasticizers (DEHP) from intravenous tubing. DEHP may adversely affect male reproductive tract development. Alternative means of dosing and administration (1 mg/kg aliquots) may need to be considered.

Pulseless VF or VT (PALS dosing): I.V.: 5 mg/kg (maximum 300 mg/dose) rapid I.V. bolus or I.O.; repeat up to a maximum daily dose of 15 mg/kg. (**Note:** Maximum recommended daily dose in adolescents is 2.2 g.)

Perfusing tachycardias (PALS dosing): I.V.: Loading dose: 5 mg/kg (maximum 300 mg/dose) I.V. over 20-60 minutes or I.O.; may repeat up to maximum dose of 15 mg/kg/day. (**Note:** Maximum recommended daily dose in adolescents is 2.2 g.)

Dosing: Renal ImpairmentHemodialysis effects: Not removed by hemodialysis or peritoneal dialysis (0% to 5%); no supplemental doses required.

Dosing: Hepatic ImpairmentDosage adjustment is probably necessary in substantial hepatic impairment. No specific guidelines available. If hepatic enzymes exceed 3 times normal or double in a patient with an elevated baseline, consider decreasing the dose or discontinuing amiodarone.

Calculations

- Amiodarone

Administration: I.V.For infusions >1 hour, use concentrations ≤2 mg/mL unless a central venous catheter is used. Use only volumetric infusion pump; use of drop counting may lead to underdosing. Administer through I.V. line with in-line filter.

Adjust administration rate to urgency (give more slowly when perfusing arrhythmia present). Slow the infusion rate if hypotension or bradycardia develops. Infusions >2 hours must be administered in glass or polyolefin bottles. **Note:** I.V. administration at lower flow rates (potentially associated with use in pediatrics) and higher concentrations than recommended may result in leaching of plasticizers (DEHP) from intravenous tubing. DEHP may adversely affect male reproductive tract development. Alternative means of dosing and administration (1 mg/kg aliquots) may need to be considered.

Administration: I.V. Detail**Incompatible** with heparin. Flush with saline prior to and following infusion.

pH: 4.08

Administration: OralAdminister consistently with regard to meals. Take in divided doses with meals if high daily dose or if GI upset occurs. If GI intolerance occurs with single-dose therapy, use twice daily dosing.

Dietary ConsiderationsAdminister consistently with regard to meals. Amiodarone is a potential source of large amounts of inorganic iodine; ~3 mg of inorganic iodine per 100 mg of amiodarone is released into the systemic circulation. Recommended daily allowance for iodine in adults is 150 mcg.

Grapefruit juice is not recommended.

StorageStore at room temperature; protect from light. When admixed in D_5W to a final concentration of 1-6 mg/mL, the solution is stable at room temperature for 24 hours in polyolefin or glass, or for 2 hours in PVC. Infusions >2 hours must be administered in glass or polyolefin bottles. Do not use evacuated glass containers; buffer may cause precipitation.

Compatibility**Variable stability (consult detailed reference):** D_5W, NS.

Y-site administration:

Compatible: Amikacin, ceftizoxime, ceftriaxone, cefuroxime, clarithromycin, clindamycin, dobutamine, dopamine, doxycycline, erythromycin lactobionate, esmolol, gentamicin, insulin (regular), isoproterenol, labetalol, lidocaine, metaraminol, metronidazole, midazolam, morphine, nitroglycerin, norepinephrine, penicillin G potassium, phentolamine, phenylephrine, potassium chloride, procainamide, tobramycin, vancomycin. **Incompatible:** Aminophylline, cefamandole, heparin, sodium bicarbonate.

Variable (consult detailed reference): Cefazolin.

Visually Compatible (Chalmers, 2001): Amphotericin B, atracurium, atropine, calcium chloride, calcium gluconate, ciprofloxacin, epinephrine, eptifibatide, famotidine, fentanyl citrate, fluconazole, furosemide (1 mg/mL), lepirudin, lorazepam, magnesium sulfate (20 mg/mL), methylprednisolone sodium succinate, milrinone, sodium nitroprusside, tirofiban, vasopressin, vecuronium. **Visually Incompatible:** Ampicillin-sulbactam, ceftazidime, digoxin, furosemide (10 mg/mL), imipenem-cilastatin, magnesium sulfate (500 mg/mL), piperacillin, piperacillin-tazobactam, potassium phosphate, sodium phosphate.

Compatibility in syringe: Incompatible: Heparin.

Compatibility when admixed: Compatible: Dobutamine, lidocaine, potassium chloride, procainamide, propafenone, verapamil. **Variable (consult detailed reference):** Furosemide, quinidine.

Extemporaneously PreparedA 5 mg/mL oral suspension has been made from tablets and has an expected stability of 91 days under refrigeration; three 200 mg tablets are crushed in a mortar, 90 mL of methylcellulose 1%, and 10 mL of syrup (syrup NF (85% sucrose in water) or flavored syrup) are added in small amounts and triturated until uniform; purified water USP is used to make a quantity sufficient to 120 mL

Nahata MC and Hipple TF, *Pediatric Drug Formulations*, 2nd ed, Cincinnati, OH: Harvey Whitney Books Co, 1992.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to amiodarone, iodine, or any component of the formulation; severe sinus-node dysfunction; second- and third-degree heart block (except in patients with a functioning artificial pacemaker); bradycardia causing syncope (except in patients with a functioning artificial pacemaker); cardiogenic shock; pregnancy

Warnings/Precautions

Boxed warnings:

- Arrhythmias: Appropriate use: See “Disease-related concerns” below.
- Hepatotoxicity: See “Concerns related to adverse effects” below.
- Proarrhythmic effect: See “Concerns related to adverse effects” below.
- Pulmonary toxicity: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Bradycardia/hypotension: May cause hypotension and bradycardia (infusion-rate related).
- Hepatotoxicity: **[U.S. Boxed Warning]: Liver toxicity is common, but usually mild with evidence of increased liver enzymes; severe liver toxicity can**

occur and has been fatal in a few cases.

- Optic neuritis/neuropathy: May cause optic neuropathy and/or optic neuritis, usually resulting in visual impairment. Corneal microdeposits occur in a majority of patients, and may cause visual disturbances in some patients (blurred vision, halos); these are not generally considered a reason to discontinue treatment. Corneal refractive laser surgery is generally contraindicated in amiodarone users (from manufacturers of surgical devices).

- Photosensitivity: Avoid excessive exposure to sunlight; may cause photosensitivity.

- Proarrhythmic effect: **[U.S. Boxed Warning]: Amiodarone can exacerbate arrhythmias, by making them more difficult to tolerate or reverse;** other types of arrhythmias have occurred, including significant heart block, sinus bradycardia new ventricular fibrillation, incessant ventricular tachycardia, increased resistance to cardioversion, and polymorphic ventricular tachycardia associated with QT$_c$ prolongation (torsade de pointes [TdP]). Risk may be increased with concomitant use of other antiarrhythmic agents or drugs that prolong the QT$_c$ interval. Proarrhythmic effects may be prolonged.

- Pulmonary toxicity: **[U.S. Boxed Warning]: Lung damage (abnormal diffusion capacity) may occur without symptoms;** monitor for pulmonary toxicity (eg, chronic interstitial pneumonitis, organizing pneumonia, acute respiratory distress syndrome, solitary pulmonary mass). Educate patients about monitoring for symptoms (eg, nonproductive cough, dyspnea, pleuritic pain, weight loss, fever, malaise). Evaluate new respiratory symptoms; pre-existing pulmonary disease does not increase risk of developing pulmonary toxicity, but if pulmonary toxicity develops then the prognosis is worse.

Disease-related concerns:

- Arrhythmias: Appropriate use: **[U.S. Boxed Warnings]: Only indicated for patients with life-threatening arrhythmias because of risk of toxicity. Alternative therapies should be tried first before using amiodarone. Patients should be hospitalized when amiodarone is initiated.** Currently, the 2005 ACLS guidelines recommend I.V. amiodarone as the preferred antiarrhythmic for the treatment of pulseless VT/VF, both life-threatening arrhythmias. In patients with non-life-threatening arrhythmias (eg, atrial fibrillation), amiodarone should be used only if the use of other antiarrhythmics has proven ineffective or are contraindicated.

- Electrolyte imbalance: Correct electrolyte disturbances, especially hypokalemia or hypomagnesemia, prior to use and throughout therapy.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Thyroid disease: Use very cautiously and with close monitoring in patients with thyroid disease; may cause hyper- or hypothyroidism. Hyperthyroidism may result in thyrotoxicosis and may aggravate or cause breakthrough arrhythmias. If any new signs of arrhythmia appear, hyperthyroidism should be considered. Thyroid function should be monitored prior to treatment and periodically thereafter, particularly in the elderly and in patients with underlying thyroid dysfunction.

Concurrent drug therapy issues:

- Drugs metabolized by CYP enzymes: Amiodarone is a potent inhibitor of CYP enzymes and transport proteins (including p-glycoprotein), which may lead to increased serum concentrations/toxicity of a number of medications.

- Drugs with QT prolongation potential: Particular caution must be used when a drug with QT$_c$-prolonging potential relies on metabolism via enzymes amiodarone inhibits, since the effect of elevated concentrations may be additive with the effect of amiodarone. Carefully assess risk:benefit of coadministration of other drugs which may prolong QT$_c$ interval.

Special populations:

- Elderly: Monitor thyroid function prior to treatment and periodically thereafter.

- Pediatrics: Safety and efficacy have not been fully established in children.

- Surgical patients: Caution in surgical patients; may enhance hemodynamic effect of anesthetics; associated with increased risk of adult respiratory distress syndrome (ARDS) postoperatively.

Dosage form specific issues:

- Benzyl alcohol: Injection contains benzyl alcohol which has been associated with “gasping syndrome” in neonates.

Other warnings/precautions:

- CAST trial: In the Cardiac Arrhythmia Suppression Trial (CAST), recent (>6 days but <2 years ago) myocardial infarction patients with asymptomatic, nonlife-threatening ventricular arrhythmias did not benefit and may have been harmed by attempts to suppress the arrhythmia with flecainide or encainide. An increased mortality or nonfatal cardiac arrest rate (7.7%) was seen in the active treatment group compared with patients in the placebo group (3%). The applicability of the CAST results to other populations is unknown. Use of amiodarone post-MI was not associated with an increase in mortality in two post-MI trials. Antiarrhythmic agents should be reserved for patients with life-threatening ventricular arrhythmias.

- Discontinuation of therapy: Patients may still be at risk for amiodarone–related drug interactions after the drug has been discontinued. The pharmacokinetics are complex (due to prolonged duration of action and half-life) and difficult to predict.

Geriatric ConsiderationsInformation describing the clinical use and pharmacokinetics in elderly is lacking; however, elderly may be predisposed to toxicity. Half-life may be prolonged due to decreased clearance; monitor closely. It is recommended to start dosing at the lower end of dosing range.

Pregnancy Risk FactorD

Pregnancy ConsiderationsMay cause fetal harm when administered to a pregnant woman, leading to congenital goiter and hypo- or hyperthyroidism.

LactationEnters breast milk/not recommended (AAP rates “of concern”)

Breast-Feeding ConsiderationsHypothyroidism may occur in nursing infants. Both amiodarone and its active metabolite are excreted in human milk. Breast-feeding may lead to significant infant exposure and potential toxicity.

Adverse ReactionsIn a recent meta-analysis, patients taking lower doses of amiodarone (152-330 mg daily for at least 12 months) were more likely to develop thyroid, neurologic, skin, ocular, and bradycardic abnormalities than those taking placebo (Vorperian, 1997). Pulmonary toxicity was similar in both the low dose amiodarone group and in the placebo group but there was a trend towards increased toxicity in the amiodarone group. Gastrointestinal and hepatic events were seen to a similar extent in both the low dose amiodarone group and placebo group. As the frequency of adverse events varies considerably across studies as a function of route and dose, a consolidation of adverse event rates is provided by Goldschlager, 2000.

>10%:

Cardiovascular: Hypotension (I.V. 16%, refractory in rare cases)

Central nervous system (3% to 40%): Abnormal gait/ataxia, dizziness, fatigue, headache, malaise, impaired memory, involuntary movement, insomnia, poor coordination, peripheral neuropathy, sleep disturbances, tremor

Dermatologic: Photosensitivity (10% to 75%)

Endocrine & Metabolic: Hypothyroidism (1% to 22%)

Gastrointestinal: Nausea, vomiting, anorexia, and constipation (10% to 33%)

Hepatic: AST or ALT level >2x normal (15% to 50%)

Ocular: Corneal microdeposits (>90%; causes visual disturbance in <10%)

1% to 10%:

Cardiovascular: CHF (3%), bradycardia (3% to 5%), AV block (5%), conduction abnormalities, SA node dysfunction (1% to 3%), cardiac arrhythmia, flushing, edema. Additional effects associated with I.V. administration include asystole, cardiac arrest, electromechanical dissociation, ventricular tachycardia, and cardiogenic shock.

Dermatologic: Slate blue skin discoloration (<10%)

Endocrine & metabolic: Hyperthyroidism (3% to 10%; more common in iodine-deficient regions of the world), libido decreased

Gastrointestinal: Abdominal pain, abnormal salivation, abnormal taste (oral)

Hematologic: Coagulation abnormalities

Hepatic: Hepatitis and cirrhosis (<3%)

Local: Phlebitis (I.V., with concentrations >3 mg/mL)

Ocular: Visual disturbances (2% to 9%), halo vision (<5% occurring especially at night), optic neuritis (1%)

Respiratory: Pulmonary toxicity has been estimated to occur at a frequency between 2% and 7% of patients (some reports indicate a frequency as high as 17%). Toxicity may present as hypersensitivity pneumonitis; pulmonary fibrosis (cough, fever, malaise); pulmonary inflammation; interstitial pneumonitis; or alveolar pneumonitis. ARDS has been reported in up to 2% of patients receiving amiodarone, and postoperatively in patients receiving oral amiodarone.

Miscellaneous: Abnormal smell (oral)

<1% (Limited to important or life-threatening): Alopecia, cholestasis, delirium, diarrhea, dyskinesias, erectile dysfunction, encephalopathy, hyperglycemia, hypertriglyceridemia, hypotension (oral), impotence, jaw tremor, myoclonic jerks, optic neuropathy, parkinsonian symptoms, photophobia, proarrhythmia, pulmonary edema, QT interval increased, rash, spontaneous ecchymosis, Stevens-Johnson syndrome, torsade de pointes (rare), ventricular fibrillation

Postmarketing and/or case reports: Acute intracranial hypertension (I.V.), acute renal failure, agranulocytosis, anaphylactic shock, angioedema, aplastic anemia, bone marrow granuloma, bronchiolitis obliterans organizing pneumonia (BOOP), bronchospasm, confusion, disorientation, dyspnea, epididymitis (noninfectious), erythema multiforme, exfoliative dermatitis, gynecomastia, hallucination, hemolytic anemia, hemoptysis, hypoxia, injection site reactions, leukocytoclastic vasculitis, muscle weakness, myopathy, neutropenia, pancreatitis, pancytopenia, pleuritis, pruritus, pseudotumor cerebri, pulmonary alveolar hemorrhage, pulmonary mass, renal impairment, renal insufficiency, respiratory failure, rhabdomyolysis, SIADH, sinus arrest, thrombocytopenia, thyroid nodules, thyroid cancer, thyrotoxicosis, toxic epidermal necrolysis, vasculitis, wheezing

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 2C8 (major at low concentration), 2C19 (minor), 2D6 (minor), 3A4 (major); **Inhibits** CYP1A2 (weak), 2A6 (moderate), 2B6 (weak), 2C9 (moderate), 2C19 (weak), 2D6 (moderate), 3A4 (moderate)

Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Antiarrhythmic Agents (Class Ia): May enhance the QTc-prolonging effect of Amiodarone. Amiodarone may increase the metabolism of Antiarrhythmic Agents (Class Ia). *Risk D: Consider therapy modification*

Azithromycin: May enhance the QTc-prolonging effect of Amiodarone. *Risk D: Consider therapy modification*

Beta-Blockers: Amiodarone may enhance the bradycardic effect of Beta-Blockers. Possibly to the point of cardiac arrest. Amiodarone may increase the serum concentration of Beta-Blockers. **Exceptions:** Levobunolol; Metipranolol. *Risk C: Monitor therapy*

Bile Acid Sequestrants: May decrease the bioavailability of Amiodarone. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the bradycardic effect of Amiodarone. Sinus arrest has been reported. *Risk D:*

Consider therapy modification

Cardiac Glycosides: Amiodarone may increase the serum concentration of Cardiac Glycosides. *Risk D: Consider therapy modification*

Cimetidine: May decrease the metabolism of Amiodarone. Consider using an alternative H_2 antagonist. *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Codeine: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of Codeine. These CYP2D6 inhibitors may prevent the metabolic conversion of codeine to its active metabolite morphine. *Risk C: Monitor therapy*

CycloSPORINE: Amiodarone may decrease the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

CYP2A6 Substrates: CYP2A6 Inhibitors (Moderate) may decrease the metabolism of CYP2A6 Substrates. *Risk C: Monitor therapy*

CYP2C8 Inducers (Highly Effective): May increase the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C8 Inhibitors (Moderate): May decrease the metabolism of CYP2C8 Substrates (High risk). *Risk C: Monitor therapy*

CYP2C8 Inhibitors (Strong): May decrease the metabolism of CYP2C8 Substrates (High risk). *Risk D: Consider therapy modification*

CYP2C9 Substrates (High risk): CYP2C9 Inhibitors (Moderate) may decrease the metabolism of CYP2C9 Substrates (High risk). *Risk C: Monitor therapy*

CYP2D6 Substrates: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of CYP2D6 Substrates. **Exceptions:** Tamoxifen. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dabigatran Etexilate: Amiodarone may increase the serum concentration of Dabigatran Etexilate. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Flecainide: Amiodarone may decrease the metabolism of Flecainide. *Risk D: Consider therapy modification*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Grapefruit Juice: May diminish the therapeutic effect of Amiodarone. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Amiodarone may decrease the metabolism of HMG-CoA Reductase Inhibitors. Management: Dose of HMG-CoA reductase inhibitor may need to be reduced (e.g., simvastatin prescribing information recommends not exceeding 20 mg/day during concurrent therapy). **Exceptions:** Pravastatin. *Risk D: Consider therapy modification*

Lidocaine: Amiodarone may decrease the metabolism of Lidocaine. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Orlistat: May decrease the absorption of Amiodarone. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: May increase the metabolism of Amiodarone. Amiodarone may decrease the metabolism of Phenytoin. *Risk C: Monitor therapy*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Amiodarone. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of Amiodarone. *Risk C: Monitor therapy*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Sodium Iodide I131: Amiodarone may diminish the therapeutic effect of Sodium Iodide I131. *Risk D: Consider therapy modification*

Tamoxifen: CYP2D6 Inhibitors (Moderate) may decrease the metabolism of Tamoxifen. Specifically, CYP2D6 inhibitors may decrease the formation of highly potent active metabolites. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

Thioridazine: CYP2D6 Inhibitors may decrease the metabolism of Thioridazine. *Risk X: Avoid combination*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

TraMADol: CYP2D6 Inhibitors (Moderate) may diminish the therapeutic effect of TraMADol. These CYP2D6 inhibitors may prevent the metabolic conversion of tramadol to its active metabolite that accounts for much of its opioid-like effects. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Amiodarone may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Food: Increases the rate and extent of absorption of amiodarone. Grapefruit juice increases bioavailability of oral amiodarone by 50% and decreases the conversion of amiodarone to N-DEA (active metabolite); altered effects are possible; use should be avoided during therapy.

Herb/Nutraceutical: St John's wort may decrease amiodarone levels or enhance photosensitization. Avoid ephedra (may worsen arrhythmia). Avoid dong quai.

Monitoring ParametersBlood pressure, heart rate (ECG) and rhythm throughout therapy; assess patient for signs of lethargy, edema of the hands or feet, weight loss, and pulmonary toxicity (baseline pulmonary function tests); liver function tests; monitor serum electrolytes, especially potassium and magnesium. Assess thyroid function tests before initiation of treatment and then periodically thereafter (some experts suggest every 3-6 months). If signs or symptoms of thyroid disease or arrhythmia breakthrough/exacerbation occur then immediate re-evaluation is necessary. Amiodarone partially inhibits the peripheral conversion of thyroxine (T_4) to triiodothyronine (T_3); serum T_4 and reverse triiodothyronine (rT_3) concentrations may be increased and serum T_3 may be decreased; most patients remain clinically euthyroid, however, clinical hypothyroidism or hyperthyroidism may occur.

Perform regular ophthalmic exams.

Reference RangeTherapeutic: 0.5-2.5 mg/L (SI: 1-4 µmol/L) (parent); desethyl metabolite is active and is present in equal concentration to parent drug

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Eye examinations should be performed periodically. Monitor cardiac status closely and assess for CNS changes. Monitor for signs of pulmonary toxicity (eg, nonproductive cough, dyspnea, pleuritic pain, weight loss, fever, malaise). **I.V.:** Requires continuous cardiac/hemodynamic monitoring and observation for adverse reactions. **Oral:** Assess results of laboratory tests, therapeutic effectiveness, and symptoms of adverse effects at beginning of therapy and regularly during long-term therapy.

Monitoring: Lab TestsThyroid function before initiation of treatment and then periodically thereafter (some experts suggest every 3-6 months), pulmonary function, liver enzymes, serum electrolytes (potassium, magnesium)

Patient Education

I.V.: Emergency use: Patient condition will determine amount of patient education.

Oral: May be taken with food to reduce GI disturbance, but be consistent. Always take with food or always take without food. Avoid grapefruit juice. Do not change dosage or discontinue drug without consulting prescriber. Regular blood work, ophthalmic exams, and cardiac assessment will be necessary while taking this medication on a long-term basis. You may experience dizziness, weakness, or insomnia (use caution when driving, climbing stairs, or engaging in tasks requiring alertness until response to drug is known); hypotension (use caution when rising from sitting or lying position); nausea, vomiting, loss of appetite, stomach discomfort, or abnormal taste (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight); or decreased libido (reversible). Report persistent dry cough or shortness of breath; chest pain, palpitations, irregular or slow heartbeat; unusual bruising or bleeding; blood in urine, feces (black stool), vomitus; warmth, swelling, pain in calves; heat or cold intolerance; weight loss or gain; restlessness; hair thinning; changes in menses; sweating; swelling in neck; muscle tremor, weakness, numbness, or changes in gait; fever; malaise; skin rash (bluish-gray color) or irritation; visual disturbances; or changes in urinary patterns. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication; use appropriate contraceptive measures. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as hydrochloride: 50 mg/mL (3 mL, 9 mL, 18 mL) [contains benzyl alcohol and polysorbate 80]

Tablet, as hydrochloride [scored]: 200 mg, 400 mg

Cordarone®: 200 mg

Pacerone®: 100 mg [not scored], 200 mg, 400 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Amiodarone HCl)

200 mg (30): $28.99

Tablets (Cordarone)

200 mg (60): $260.54

Tablets (Pacerone)

100 mg (30): $139.99

Mechanism of ActionClass III antiarrhythmic agent which inhibits adrenergic stimulation (alpha- and beta-blocking properties), affects sodium, potassium, and calcium channels, prolongs the action potential and refractory period in myocardial tissue; decreases AV conduction and sinus node function

Pharmacodynamics/Kinetics

Onset of action: Oral: 2 days to 3 weeks; I.V.: May be more rapid

Peak effect: 1 week to 5 months

Duration after discontinuing therapy: 7-50 days

Note: Mean onset of effect and duration after discontinuation may be shorter in children than adults

Distribution: V_d: 66 L/kg (range: 18-148 L/kg); crosses placenta; enters breast milk in concentrations higher than maternal plasma concentrations

Protein binding: 96%

Metabolism: Hepatic via CYP2C8 and 3A4 to active N-desethylamiodarone metabolite; possible enterohepatic recirculation

Bioavailability: Oral: ~50%

Half-life elimination: Terminal: 40-55 days (range: 26-107 days); shorter in children than adults

Excretion: Feces; urine (<1% as unchanged drug)

Related Information

- Antiarrhythmic Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Oral: Abnormal salivation and taste

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsAmiodarone is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Mental Health: Effects on Mental StatusInsomnia, nightmares, and fatigue are common; postmarketing reports of confusion, delirium, disorientation, and hallucinations

Mental Health: Effects on Psychiatric TreatmentContraindicated with ziprasidone. May cause hypotension which may be exacerbated by psychotropics; may cause hypothyroidism; use caution with lithium. Postmarketing reports of agranulocytosis; use caution with clozapine and carbamazepine.

Cardiovascular ConsiderationsAmiodarone is associated with less proarrhythmic effects compared to other antiarrhythmic drugs. Bradycardia often accompanies amiodarone use and should be anticipated, especially when combined with beta-blockers or nondihydropyridine calcium channel blockers. Clinical trials demonstrate that amiodarone is a safe and effective antiarrhythmic for the treatment of supraventricular and ventricular arrhythmias in patients with underlying cardiovascular disease (myocardial infarction, heart failure). In a recent study, early amiodarone administration prolonged survival to hospitalization in patients suffering out-of-hospital cardiac arrest. In the setting of acute myocardial infarction, beta-blocker therapy should still be initiated even though concomitant amiodarone therapy provides beta-blockade. To avoid potential side effects, chronic amiodarone therapy, when possible, should be maintained at the lowest effective dose (≤400 mg/day). The potential for drug interaction should be evaluated prior to amiodarone therapy (see Drug Interactions). Switching amiodarone formulations in some patients may lead to serious problems. Encourage patients to continue with initial product. If product is changed, monitoring for 1-3 months after change is necessary. Useful in treatment of atrial fibrillation in patients with heart failure (ACC/AHA/ESC Practice Guidelines).

Anesthesia and Critical Care Concerns/Other Considerations

Cardiac Arrest: The ARREST trial was a randomized, placebo-controlled trial evaluating amiodarone's efficacy in patients who had an out-of-hospital cardiac arrest with pulseless ventricular tachycardia or ventricular fibrillation. The primary endpoint was admission to the hospital with a spontaneous perfusing rhythm. Patients were randomized to receive 300 mg of intravenous amiodarone or placebo after being shocked >3 times, intubated, and receiving 1 mg of epinephrine. Ventricular fibrillation was the most common initial arrhythmia (88%). More patients in the amiodarone group were successfully resuscitated (44% amiodarone; 34% placebo; p=0.03) and admitted to the hospital, but mortality was similar in both groups (possibly due to sample size). More recently, the ALIVE trial compared amiodarone to lidocaine in out-of-hospital cardiac arrest victims whose ventricular fibrillation was resistant to 3 defibrillation attempts in addition to epinephrine and a fourth defibrillation attempt (Dorian, 2002). This was a randomized, double-blind comparison. Other inclusion criteria included ventricular fibrillation unrelated to trauma (or with other arrhythmias that converted to ventricular fibrillation) and recurrent ventricular fibrillation after successful initial defibrillation. The primary endpoint was the number of patients who were admitted to the hospital intensive care unit alive. Three hundred and forty-seven patients were enrolled. The initial amiodarone dose was 5 mg/kg and the lidocaine dose was 1.5 mg/kg. If ventricular fibrillation persisted after another shock, then the study drug could be administered again (amiodarone 2.5 mg/kg, lidocaine 1.5 mg/kg). Significantly more amiodarone patients (~23%) were admitted to the hospital alive than lidocaine patients (12%). The majority (>90%) of patients in the ALIVE trial had ventricular fibrillation as the initial arrhythmia. The authors concluded that intravenous amiodarone is superior to lidocaine in the treatment of shock-resistant, out-of-hospital ventricular fibrillation.

Arrhythmias: In patients with severe left ventricular dysfunction, amiodarone is preferable over other antiarrhythmics.

Index TermsAmiodarone Hydrochloride

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(a mee TRIP ti leen & klor dye az e POKS ide)

U.S. Brand NamesLimbitrol®; Limbitrol® DS

Canadian Brand NamesLimbitrol®

Pharmacologic CategoryAntidepressant, Tricyclic (Tertiary Amine); Benzodiazepine

Use: Labeled IndicationsTreatment of moderate to severe anxiety and/or agitation and depression

Dosing: AdultsDepression and anxiety: Oral: Initial: 3-4 tablets in divided doses; this may be increased to 6 tablets/day as required. Some patients respond to smaller doses and can be maintained on 2 tablets.

Dosing: ElderlyRefer to adult dosing.

RestrictionsC-IV

An FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

ContraindicationsHypersensitivity to benzodiazepines, tricyclic antidepressants, or any component of the formulation; depression of CNS; MAO inhibitors; acute recovery phase following MI; angle-closure glaucoma; pregnancy

Allergy Considerations

- Benzodiazepine Allergy
- Tricyclic Antidepressant and Related Compounds Allergy

- Suicidal thinking/behavior: See “Major psychiatric warnings” below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient’s family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription. **Amitriptyline and chlordiazepoxide combination is FDA approved for depression associated with anxiety in children ≥12 years of age.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **This combination is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Anterograde amnesia: Benzodiazepines have been associated with anterograde amnesia.

- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. The degree of anticholinergic blockade produced by amitriptyline is very high relative to other antidepressants.

- Orthostatic hypotension: May cause orthostatic hypotension (risk is very high relative to other antidepressants); use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Paradoxical reactions: Paradoxical reactions, including hyperactive or aggressive behavior, have been reported with benzodiazepines, particularly in adolescent/pediatric or psychiatric patients.

- Sedation: Both agents may cause sedation, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving). The degree of sedation is very high relative to other antidepressants.

- SIADH and hyponatremia: Has been associated with the development of SIADH and hyponatremia.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with a history of cardiovascular disease (including previous MI, stroke, tachycardia, or conduction abnormalities); the risk conduction abnormalities with amitriptyline is high relative to other antidepressants.

- Depression: Use chlordiazepoxide with caution in patients with depression, particularly if suicidal risk may be present.

- Drug abuse: Use chlordiazepoxide with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.

- Diabetes: Use amitriptyline with caution in patients with diabetes mellitus; may alter glucose regulation.

- Hepatic impairment: Use both agents with caution in patients with hepatic impairment.

- Impaired gag reflux: Use chlordiazepoxide with caution in patients with an impaired gag reflux.

- Porphyria: Use chlordiazepoxide with caution in patients with porphyria.

- Renal impairment: Use both agents with caution in patients with renal impairment.

- Respiratory disease: Use chlordiazepoxide with caution in patients with respiratory disease.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

- Thyroid dysfunction: Use with caution in patients with hyperthyroidism or those receiving thyroid supplementation.

Concurrent drug therapy issues:

- CNS depressants/psychoactive medications: Use chlordiazepoxide with caution in patients receiving other CNS depressants or psychoactive medication.

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Debilitated patients: Use chlordiazepoxide with caution in debilitated patients; active metabolites with extended half-lives may lead to delayed accumulation and adverse effects.

- Elderly: Use both agents with caution in the elderly. Benzodiazepines have been associated with falls and traumatic injury; active metabolites with extended half-lives may lead to delayed accumulation and adverse effects.

- Pediatrics: Use chlordiazepoxide with caution in children; active metabolites with extended half-lives may lead to delayed accumulation and adverse effects.

Dosage form specific issues:

- Chlordiazepoxide injection: Parenteral administration should be avoided in comatose patients or shock. Adequate resuscitative equipment/personnel should be available, and appropriate monitoring should be conducted at the time of injection and for several hours following administration. The parenteral formulation should be diluted for I.M. administration with the supplied diluent only. This diluent should not be used when preparing the drug for intravenous administration.

Other warnings/precautions:

- Appropriate use: Chlordiazepoxide does not have analgesic, antidepressant, or antipsychotic properties.

- Discontinuation of therapy: Amitriptyline therapy should not be abruptly discontinued in patients receiving high doses for prolonged periods. Rebound or withdrawal symptoms may occur following abrupt discontinuation of chlordiazepoxide or large decreases in dose. Use caution when reducing dose or withdrawing therapy; decrease slowly and monitor for withdrawal symptoms. Flumazenil may cause withdrawal in patients receiving long-term benzodiazepine therapy.

- Electroconvulsive therapy: May increase the risks associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.

Pregnancy Risk FactorD
LactationExcretion in breast milk unknown/contraindicated
Adverse ReactionsSee individual agents.
Metabolism/Transport Effects

Amitriptyline: **Substrate** of CYP1A2 (minor), 2B6 (minor), 2C9 (minor), 2C19 (minor), 2D6 (major), 3A4 (minor); **Inhibits** CYP1A2 (weak), 2C9 (weak), 2C19 (weak), 2D6 (weak), 2E1 (weak)

Chlordiazepoxide: **Substrate** of CYP3A4 (major)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Tricyclic Antidepressants may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Agonists: Tricyclic Antidepressants may enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Alpha2-Agonists: Tricyclic Antidepressants may diminish the antihypertensive effect of Alpha2-Agonists. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Altretamine: May enhance the orthostatic effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Amphetamines: Tricyclic Antidepressants may enhance the stimulatory effect of Amphetamines. Tricyclic Antidepressants may also potentiate the cardiovascular effects of Amphetamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Aprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Aspirin: Antidepressants (Tricyclic, Tertiary Amine) may enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Beta2-Agonists: Tricyclic Antidepressants may enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

BuPROPion: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Cinacalcet: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Cisapride: Amitriptyline may enhance the arrhythmogenic effect of Cisapride. *Risk X: Avoid combination*

Clozapine: Benzodiazepines may enhance the adverse/toxic effect of Clozapine. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Desmopressin: Tricyclic Antidepressants may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Dexmethylphenidate: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Disulfiram: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

DULoxetine: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Fosaprepitant: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). Specifically, the active metabolite aprepitant is likely responsible for this effect. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Grapefruit Juice: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Iobenguane I 123: Tricyclic Antidepressants may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Isoniazid: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Lithium: May enhance the neurotoxic effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

MAO Inhibitors: May enhance the serotonergic effect of Tricyclic Antidepressants. This may cause serotonin syndrome. *Risk X: Avoid combination*

Methylphenidate: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Nefazodone: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

NSAID (COX-2 Inhibitor): Antidepressants (Tricyclic, Tertiary Amine) may enhance the antiplatelet effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Antidepressants (Tricyclic, Tertiary Amine) may enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Oral Contraceptive (Estrogens): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Oral Contraceptive (Progestins): May decrease the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Phenytoin: Benzodiazepines may increase the serum concentration of Phenytoin. Short-term exposure to benzodiazepines may not present as much risk as chronic therapy. *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Propoxyphene: May enhance the CNS depressant effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). Management: Amprenavir, atazanavir, darunavir, indinavir, nelfinavir, ritonavir, and tipranavir are contraindicated with midazolam and triazolam according to each protease inhibitor's prescribing information. *Risk D: Consider therapy modification*

Protease Inhibitors: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Proton Pump Inhibitors: May increase the serum concentration of Benzodiazepines (metabolized by oxidation). **Exceptions:** Lansoprazole; Pantoprazole; Rabeprazole. *Risk C: Monitor therapy*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

QuiNIDine: Tricyclic Antidepressants may enhance the QTc-prolonging effect of QuiNIDine. QuiNIDine may decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Benzodiazepines (metabolized by oxidation). **Exceptions:** Citalopram; Escitalopram; PARoxetine; Sertraline. *Risk C: Monitor therapy*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

St Johns Wort: May increase the metabolism of Tricyclic Antidepressants. The risk of serotonin syndrome may theoretically be increased. *Risk D: Consider therapy modification*

St Johns Wort: May increase the metabolism of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Sulfonylureas: Cyclic Antidepressants may enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Terbinafine: May decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Theophylline Derivatives: May diminish the therapeutic effect of Benzodiazepines. *Risk D: Consider therapy modification*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

TraMADol: Tricyclic Antidepressants may enhance the neuroexcitatory and/or seizure-potentiating effect of TraMADol. *Risk C: Monitor therapy*

Valproic Acid: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Tricyclic Antidepressants may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Monitoring ParametersSuicidal ideation (especially at the beginning of therapy or when doses are increased or decreased)

Nursing: Physical Assessment/MonitoringSee individual agents.

Patient EducationSee individual agents. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 12.5/5: Amitriptyline hydrochloride 12.5 mg and chlordiazepoxide 5 mg; 25/10: Amitriptyline hydrochloride 25 mg and chlordiazepoxide 10 mg

Limbitrol®: 12.5/5: Amitriptyline hydrochloride 12.5 mg and chlordiazepoxide 5 mg

Limbitrol® DS: 25/10: Amitriptyline hydrochloride 25 mg and chlordiazepoxide 10 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Chlordiazepoxide-Amitriptyline)

5-12.5 mg (60): $44.99

10-25 mg (60): $65.99

Tablets (Limbitrol DS)

10-25 mg (60): $99.99

Mechanism of ActionSee individual agents.

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Amitriptyline
- ChlordiazePOXIDE

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment:

Amitriptyline: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation), orthostatic hypotension, stomatitis, peculiar taste, and black tongue. Amitriptyline is the most anticholinergic and sedating of the antidepressants; has pronounced effects on the cardiovascular system. Long-term treatment with TCAs such as amitriptyline increases the risk of caries by reducing salivation and salivary buffer capacity. In a study by Rundergren, et al, pathological alterations were observed in the oral mucosa of 72% of 58 patients; 55% had new carious lesions after taking TCAs for a median of $5^1/_2$ years. Current research is investigating the use of the salivary stimulant pilocarpine (Salagen®) to overcome the xerostomia from amitriptyline.

Chlordiazepoxide: Over 10% of patients will experience xerostomia which disappears with cessation of drug therapy.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution; epinephrine and levonordefrin have been shown to have an increased pressor response in combination with TCAs

Mental Health CommentTricyclic antidepressants may be classified as tertiary (amitriptyline, doxepin, clomipramine, imipramine, trimipramine) or secondary amines (nortriptyline, desipramine, protriptyline). The tertiary amines are not recommended to treat depression in the elderly. If a TCA is used in the elderly, it should be a secondary amine. The tertiary amines are commonly used in low dosages for various conditions associated with pain. Toxicity is generally dose dependent. Relatively small overdoses (1-week supply) can be potentially fatal.

In 2007, the FDA requested that all manufacturers of sedative-hypnotic drug products revise labeling to include a greater emphasis on the risks of adverse effects. These risks include severe allergic reactions (anaphylaxis, angioedema) and complex sleep-related behaviors, which may include sleep-driving (driving while not fully awake and with no memory of the event), making phone calls, and preparing and eating food while asleep.

Risk factors for abuse include personal or family history of substance abuse and personality disorder.

Index TermsChlordiazepoxide and Amitriptyline Hydrochloride

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(a mee TRIP ti leen & per FEN a zeen)

Canadian Brand NamesEtrafon®

Pharmacologic CategoryAntidepressant, Tricyclic (Tertiary Amine); Antipsychotic Agent, Typical, Phenothiazine

Use: Labeled IndicationsTreatment of patients with moderate to severe anxiety and depression

Use: Unlabeled/InvestigationalDepression with psychotic features

Dosing: AdultsDepression and anxiety: Oral: 1 tablet 2-4 times/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Hepatic ImpairmentAvoid use in severe hepatic failure.

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

ContraindicationsHypersensitivity to amitriptyline, perphenazine, or any component of the formulation (cross-sensitivity with other phenothiazines may exist); angle-closure glaucoma; bone marrow depression; severe liver or cardiac disease; pregnancy

Allergy Considerations

- Phenothiazine Allergy
- Tricyclic Antidepressant and Related Compounds Allergy

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See “Major psychiatric warnings” below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient’s family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription. **Amitriptyline is not FDA-approved for use in children <12 years of age; this combination is not FDA approved for use in children.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **This combination is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Altered cardiac conduction: May alter cardiac conduction; life-threatening arrhythmias have occurred with therapeutic doses of antipsychotics.

- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. Relative to other neuroleptics, perphenazine has a low potency of cholinergic blockade and relative to other antidepressants amitriptyline has a high potential for cholinergic blockade.

- Esophageal dysmotility/aspiration: Antipsychotic use has been associated with esophageal dysmotility and aspiration; use with caution in patients at risk of pneumonia (ie, Alzheimer's disease).

- Extrapyramidal symptoms: May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia (risk of these reactions is moderate-high relative to other neuroleptics).

- Neuroleptic malignant syndrome (NMS): Use of perphenazine may be associated with NMS; monitor for mental status changes, fever, muscle rigidity, and/or autonomic instability (risk may be increased in patients with Parkinson's disease or Lewy body dementia).

- Orthostatic hypotension: Both agents may cause orthostatic hypotension (risk is very high relative to other antidepressants); use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Pigmentary retinopathy: Perphenazine use may be associated with pigmentary retinopathy.

- Sedation: Both agents may cause sedation, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving). The degree of sedation is high relative to other antidepressants.

- SIADH and hyponatremia: Has been associated with the development of SIADH and hyponatremia.

- Temperature regulation: Impaired core body temperature regulation may occur with perphenazine use; caution with strenuous exercise, heat exposure, dehydration, and concomitant medication possessing anticholinergic effects.

Disease-related concerns:

- Cardiovascular disease: Use both agents with caution in patients with a history of cardiovascular disease (including previous MI, stroke, tachycardia, or conduction abnormalities); the risk conduction abnormalities with this agent is high relative to other antidepressants.

- Diabetes: Use amitriptyline with caution in patients with diabetes mellitus; may alter glucose regulation.

- Glaucoma: Use with caution in patients with narrow-angle glaucoma; condition may be exacerbated by cholinergic blockade. Screening is recommended.

- Hepatic impairment: Use both agents with caution in patients with hepatic impairment.

- Myasthenia gravis: Use with caution in patients with myasthenia gravis; condition may be exacerbated by cholinergic blockade.

- Parkinson's disease: Use perphenazine with caution in patients with Parkinson's disease; they may be more sensitive to adverse effects.

- Prolactin-dependent tumors: Use perphenazine with caution in patients with breast cancer or other prolactin-dependent tumors; elevates prolactin levels.

- Renal impairment: Use both agents with caution in patients with renal impairment.

- Respiratory disease: Use perphenazine with caution in patients with respiratory disease.

- Seizure disorder: Use both agents with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

- Thyroid dysfunction: Use with caution in patients with hyperthyroidism or those receiving thyroid supplementation.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; increased risk for developing tardive dyskinesia from perphenazine.

Other warnings/precautions:

- Discontinuation of therapy: Therapy should not be abruptly discontinued in patients receiving high doses for prolonged periods.

- Electroconvulsive therapy: May increase the risks associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.

Pregnancy Risk FactorD
LactationEnters breast milk/contraindicated
Adverse Reactions

Based on **amitriptyline** component: Anticholinergic effects may be pronounced; moderate to marked sedation can occur (tolerance to these effects usually occurs). Frequency not defined:

Cardiovascular: Orthostatic hypotension, tachycardia, ECG changes (nonspecific), AV conduction changes

Central nervous system: Restlessness, dizziness, insomnia, sedation, fatigue, anxiety, cognitive function impaired, seizure, extrapyramidal symptoms

Dermatologic: Allergic rash, urticaria, photosensitivity

Gastrointestinal: Weight gain, xerostomia, constipation

Genitourinary: Urinary retention

Ocular: Blurred vision, mydriasis

Miscellaneous: Diaphoresis

Based on **perphenazine** component: Frequency not defined:

Cardiovascular: Hyper-/hypotension, orthostatic hypotension, tachycardia, bradycardia, dizziness, cardiac arrest

Central nervous system: Extrapyramidal symptoms (pseudoparkinsonism, akathisia, dystonias, tardive dyskinesia), dizziness, cerebral edema, seizure, headache, drowsiness, paradoxical excitement, restlessness, hyperactivity, insomnia, neuroleptic malignant syndrome (NMS), impairment of temperature regulation

Dermatologic: Sun sensitivity increased, rash, discoloration of skin (blue-gray)

Endocrine & metabolic: Hypoglycemia, hyperglycemia, galactorrhea, lactation, breast enlargement, gynecomastia, menstrual irregularity, amenorrhea, SIADH, libido changes

Gastrointestinal: Constipation, weight gain, vomiting, stomach pain, nausea, xerostomia, salivation, diarrhea, anorexia, ileus

Genitourinary: Difficulty in urination, ejaculatory disturbances, incontinence, polyuria, ejaculating dysfunction, priapism

Hematologic: Agranulocytosis, leukopenia, eosinophilia, hemolytic anemia, thrombocytopenic purpura, pancytopenia

Hepatic: Cholestatic jaundice, hepatotoxicity

Neuromuscular & skeletal: Tremor

Ocular: Pigmentary retinopathy, blurred vision, cornea and lens changes

Respiratory: Nasal congestion

Miscellaneous: Diaphoresis

Metabolism/Transport Effects

Amitriptyline: **Substrate** of CYP1A2 (minor), 2B6 (minor), 2C9 (minor), 2C19 (minor), 2D6 (major), 3A4 (minor); **Inhibits** CYP1A2 (weak), 2C9 (weak), 2C19 (weak), 2D6 (weak), 2E1 (weak)

Perphenazine: **Substrate** of CYP1A2 (minor), 2C9 (minor), 2C19 (minor), 2D6 (major), 3A4 (minor); **Inhibits** CYP1A2 (weak), 2D6 (weak)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): May enhance the neurotoxic (central) effect of Antipsychotics. Severe extrapyramidal symptoms have occurred in some patients. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Tricyclic Antidepressants may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Agonists: Tricyclic Antidepressants may enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Alpha2-Agonists: Tricyclic Antidepressants may diminish the antihypertensive effect of Alpha2-Agonists. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Altretamine: May enhance the orthostatic effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Amphetamines: Tricyclic Antidepressants may enhance the stimulatory effect of Amphetamines. Tricyclic Antidepressants may also potentiate the cardiovascular effects of Amphetamines. *Risk C: Monitor therapy*

Amphetamines: Antipsychotics may diminish the stimulatory effect of Amphetamines. *Risk C: Monitor therapy*

Analgesics (Opioid): Antipsychotic Agents (Phenothiazines) may enhance the hypotensive effect of Analgesics (Opioid). *Risk C: Monitor therapy*

Antacids: May decrease the absorption of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Antimalarial Agents: May increase the serum concentration of Antipsychotic Agents (Phenothiazines). *Risk C: Monitor therapy*

Anti-Parkinson's Agents (Dopamine Agonist): Antipsychotics (Typical) may diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Aspirin: Antidepressants (Tricyclic, Tertiary Amine) may enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Beta2-Agonists: Tricyclic Antidepressants may enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Beta-Blockers: Antipsychotic Agents (Phenothiazines) may enhance the hypotensive effect of Beta-Blockers. Beta-Blockers may decrease the metabolism of Antipsychotic Agents (Phenothiazines). Antipsychotic Agents (Phenothiazines) may decrease the metabolism of Beta-Blockers. **Exceptions:** Atenolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

BuPROPion: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Cinacalcet: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Cisapride: Amitriptyline may enhance the arrhythmogenic effect of Cisapride. *Risk X: Avoid combination*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Desmopressin: Tricyclic Antidepressants may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Dexmethylphenidate: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

DULoxetine: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Iobenguane I 123: Tricyclic Antidepressants may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: May enhance the neurotoxic effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Lithium formulations: May enhance the neurotoxic effect of Antipsychotics. Lithium formulations may decrease the serum concentration of Antipsychotics. Specifically noted with chlorpromazine. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the serotonergic effect of Tricyclic Antidepressants. This may cause serotonin syndrome. *Risk X: Avoid combination*

Methylphenidate: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

NSAID (COX-2 Inhibitor): Antidepressants (Tricyclic, Tertiary Amine) may enhance the antiplatelet effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Antidepressants (Tricyclic, Tertiary Amine) may enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Propoxyphene: May enhance the CNS depressant effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Protease Inhibitors: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

QuiNIDine: Tricyclic Antidepressants may enhance the QTc-prolonging effect of QuiNIDine. QuiNIDine may decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

St Johns Wort: May increase the metabolism of Tricyclic Antidepressants. The risk of serotonin syndrome may theoretically be increased. *Risk D: Consider therapy modification*

Sulfonylureas: Cyclic Antidepressants may enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Terbinafine: May decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Tetrabenazine: May enhance the adverse/toxic effect of Antipsychotics. *Risk C: Monitor therapy*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

TraMADol: Tricyclic Antidepressants may enhance the neuroexcitatory and/or seizure-potentiating effect of TraMADol. *Risk C: Monitor therapy*

Valproic Acid: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Tricyclic Antidepressants may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased.

Risk X: Avoid combination

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (due to increased sedation).

Monitoring ParametersVital signs; lipid profile, fasting blood glucose/Hb A_{1c}; BMI, weight; mental status, abnormal involuntary movement scale (AIMS), extrapyramidal symptoms (EPS), suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased)

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsLipid profile, fasting blood glucose/Hb A_{1c}; BMI

Patient EducationSee individual agents. Do not drink alcoholic beverages. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

2-10: Amitriptyline hydrochloride 10 mg and perphenazine 2 mg

2-25: Amitriptyline hydrochloride 25 mg and perphenazine 2 mg

4-10: Amitriptyline hydrochloride 10 mg and perphenazine 4 mg

4-25: Amitriptyline hydrochloride 25 mg and perphenazine 4 mg

4-50: Amitriptyline hydrochloride 50 mg and perphenazine 4 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Perphenazine-Amitriptyline)

2-10 mg (60): $16.99

2-25 mg (30): $13.99

4-25 mg (60): $19.99

4-50 mg (60): $27.99

Mechanism of Action

Amitriptyline increases the synaptic concentration of serotonin and/or norepinephrine in the central nervous system by inhibition of their reuptake by the presynaptic neuronal membrane.

Perphenazine is a piperazine phenothiazine antipsychotic which blocks postsynaptic mesolimbic dopaminergic receptors in the brain; exhibits alpha-adrenergic blocking effect and depresses the release of hypothalamic and hypophyseal hormones.

Pharmacodynamics/KineticsSee individual agents.

Related Information

- Amitriptyline
- Perphenazine

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment:

Amitriptyline: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation), orthostatic hypotension, stomatitis, peculiar taste, and black tongue. Amitriptyline is the most anticholinergic and sedating of the antidepressants; has pronounced effects on the cardiovascular system. Long-term treatment with TCAs such as amitriptyline increases the risk of caries by reducing salivation and salivary buffer capacity. In a study by Rundergren, et al, pathological alterations were observed in the oral mucosa of 72% of 58 patients; 55% had new carious lesions after taking TCAs for a median of $5^1/_2$ years. Current research is investigating the use of the salivary stimulant pilocarpine (Salagen®) to overcome the xerostomia from amitriptyline.

Perphenazine: Extrapyramidal symptoms (pseudoparkinsonism, akathisia, dystonias, tardive dyskinesia), dizziness, seizures, headache, drowsiness, paradoxical excitement, restlessness, and hyperactivity.

Tardive dyskinesia: Prevalence rate may be 40% in elderly; development of the syndrome and the irreversible nature are proportional to duration and total cumulative dose over time. Extrapyramidal reactions are more common in elderly with up to 50% developing these reactions after 60 years of age. Drug-induced Parkinson's syndrome occurs often; akathisia is the most common extrapyramidal reaction in elderly.

Increased confusion, memory loss, psychotic behavior, and agitation frequently occur as a consequence of anticholinergic effects. Antipsychotic associated sedation in nonpsychotic patients is extremely unpleasant due to feelings of depersonalization, derealization, and dysphoria.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions

Amitriptyline: Use with caution; epinephrine and levonordefrin have been shown to have an increased pressor response in combination with TCAs

Perphenazine: No information available to require special precautions

Mental Health CommentTricyclic antidepressants may be classified as tertiary (amitriptyline, doxepin, clomipramine, imipramine, trimipramine) or secondary amines (nortriptyline, desipramine, protriptyline). The tertiary amines are not recommended to treat depression in the elderly. If a TCA is used in the elderly, it should be a secondary amine. The tertiary amines are commonly used in low dosages for various conditions associated with pain. Toxicity is generally dose dependent. Relatively small overdoses (1-week supply) can be potentially fatal.

Not commonly used; use of individual drugs allows for more flexibility in dosing and discontinuation of unneeded agent.

Coadministration of two or more antipsychotics does not generally improve clinical response and may increase the potential for adverse effects. Long-term use of perphenazine, as is the case with any antipsychotic drug, may be associated with tardive dyskinesia (TD).

In 2008, the FDA issued a warning regarding increased mortality risk with typical **and** atypical antipsychotic drugs when used in elderly patients with dementia-related psychosis.

Index Terms Perphenazine and Amitriptyline Hydrochloride

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Amitriptyline may be confused with aminophylline, imipramine, nortriptyline

Elavil® may be confused with Aldoril®, Eldepryl®, enalapril, Equanil®, Mellaril®, Oruvail®, Plavix®

Pronunciation(a mee TRIP ti leen)

Canadian Brand NamesApo-Amitriptyline®; Levate®; Novo-Triptyn; PMS-Amitriptyline

Pharmacologic CategoryAntidepressant, Tricyclic (Tertiary Amine)

Use: Labeled IndicationsRelief of symptoms of depression

Use: Unlabeled/InvestigationalAnalgesic for certain chronic and neuropathic pain; prophylaxis against migraine headaches; treatment of depressive disorders in children

Use: DentalManagement of chronic neuropathic pain in temporomandibular dysfunction (TMD)

Dosing: Adults

Depression: Oral: 50-150 mg/day single dose at bedtime or in divided doses; dose may be gradually increased up to 300 mg/day.

Chronic pain management (unlabeled use): Oral: Initial: 25 mg at bedtime; may increase as tolerated to 100 mg/day.

Migraine prophylaxis (unlabeled use): Oral: Initial: 10-25 mg at bedtime; usual dose: 150 mg; reported dosing ranges: 10-400 mg/day

Dosing: ElderlyDepression: Oral: Initial: 10-25 mg at bedtime; dose should be increased in 10-25 mg increments every week if tolerated; dose range: 25-150 mg/day. See Renal/Hepatic Impairment.

Dosing: Pediatric

Chronic pain management (unlabeled use): Oral: Initial: 0.1 mg/kg at bedtime, may advance as tolerated over 2-3 weeks to 0.5-2 mg/kg at bedtime

Depressive disorders:

Children (unlabeled use): Oral: Initial doses of 1 mg/kg/day given in 3 divided doses with increases to 1.5 mg/kg/day have been reported in a small number of children (n=9) 9-12 years of age; clinically, doses up to 3 mg/kg/day (5 mg/kg/day if monitored closely) have been proposed

Adolescents: Initial: 25-50 mg/day; may administer in divided doses; increase gradually to 100 mg/day in divided doses.

Migraine prophylaxis (unlabeled use): Oral: Initial: 0.25 mg/kg/day, given at bedtime; increase dose by 0.25 mg/kg/day to maximum 1 mg/kg/day. Reported dosing ranges: 0.1-2 mg/kg/day; maximum suggested dose: 10 mg.

Dosing: Renal ImpairmentNondialyzable

Dosing: Hepatic ImpairmentUse with caution and monitor plasma levels and patient response.

StorageProtect Elavil® 10 mg tablets from light.

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

ContraindicationsHypersensitivity to amitriptyline or any component of the formulation (cross-sensitivity with other tricyclics may occur); use of MAO inhibitors within past 14 days; acute recovery phase following myocardial infarction; concurrent use of cisapride

Allergy Considerations

- Tricyclic Antidepressant and Related Compounds Allergy

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See “Major psychiatric warnings” below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient's family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription. **Amitriptyline is not FDA-approved for use in children <12 years of age.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.
- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.
- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Amitriptyline is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. The degree of anticholinergic blockade produced by this agent is high relative to other antidepressants.
- Hematologic effects: TCAs may rarely cause bone marrow suppression; monitor for any signs of infection and obtain CBC if symptoms (eg, fever, sore throat) evident.
- Orthostatic hypotension: May cause orthostatic hypotension (risk is very high relative to other antidepressants); use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).
- Sedation: May cause sedation, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving). The degree of sedation is very high relative to other antidepressants.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with a history of cardiovascular disease (including previous MI, stroke, tachycardia, or conduction abnormalities); the risk of conduction abnormalities with this agent is high relative to other antidepressants.
- Diabetes: Use with caution in patients with diabetes mellitus; may alter glucose regulation.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Renal impairment: Use with caution in patients with renal impairment.
- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.
- Thyroid dysfunction: Use with caution in patients with hyperthyroidism or those receiving thyroid supplementation due to concerns of pro-arrhythmogenesis.

Concurrent drug therapy issues:

- Anticholinergic and/or neuroleptic agents: Hyperpyrexia has been observed with TCAs in combination with anticholinergics and/or neuroleptics, particularly during hot weather.
- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly.

Other warnings/precautions:

- Discontinuation of therapy: Recommended to discontinue prior to elective surgery requiring general anesthesia. Therapy should not be abruptly discontinued in patients receiving high doses for prolonged periods.
- Electroconvulsive therapy: May increase the risks associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.

Geriatric ConsiderationsNot a drug of choice for elderly. The most anticholinergic and sedating of the antidepressants; pronounced effects on the cardiovascular system (hypotension), hence, many geropsychiatrists agree it is best to avoid in elderly.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects have been observed in animal studies. Amitriptyline crosses the human placenta; CNS effects, limb deformities and developmental delay have been noted in case reports.

LactationEnters breast milk/not recommended (AAP rates "of concern")

Breast-Feeding ConsiderationsGenerally, it is not recommended to breast-feed if taking antidepressants because of the long half-life, active metabolites, and the potential for side effects in the infant.

Adverse ReactionsAnticholinergic effects may be pronounced; moderate to marked sedation can occur (tolerance to these effects usually occurs).

Frequency not defined.

Cardiovascular: Orthostatic hypotension, tachycardia, ECG changes (nonspecific), AV conduction changes, cardiomyopathy (rare), MI, stroke, heart block, arrhythmia, syncope, hypertension, palpitation

Central nervous system: Restlessness, dizziness, insomnia, sedation, fatigue, anxiety, cognitive function impaired, seizure, extrapyramidal symptoms, coma, hallucinations, confusion, disorientation, coordination impaired, ataxia, headache, nightmares, hyperpyrexia

Dermatologic: Allergic rash, urticaria, photosensitivity, alopecia

Endocrine & metabolic: Syndrome of inappropriate ADH secretion

Gastrointestinal: Weight gain, xerostomia, constipation, paralytic ileus, nausea, vomiting, anorexia, stomatitis, peculiar taste, diarrhea, black tongue

Genitourinary: Urinary retention

Hematologic: Bone marrow depression, purpura, eosinophilia

Neuromuscular & skeletal: Numbness, paresthesia, peripheral neuropathy, tremor, weakness

Ocular: Blurred vision, mydriasis, ocular pressure increased

Otic: Tinnitus

Miscellaneous: Diaphoresis, withdrawal reactions (nausea, headache, malaise)

Postmarketing and/or case reports: Neuroleptic malignant syndrome (rare), serotonin syndrome (rare)

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor), 2B6 (minor), 2C9 (minor), 2C19 (minor), 2D6 (major), 3A4 (minor); **Inhibits** CYP1A2 (weak), 2C9 (weak), 2C19 (weak), 2D6 (weak), 2E1 (weak)
Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Tricyclic Antidepressants may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Agonists: Tricyclic Antidepressants may enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Alpha2-Agonists: Tricyclic Antidepressants may diminish the antihypertensive effect of Alpha2-Agonists. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Altretamine: May enhance the orthostatic effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Amphetamines: Tricyclic Antidepressants may enhance the stimulatory effect of Amphetamines. Tricyclic Antidepressants may also potentiate the cardiovascular effects of Amphetamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Aspirin: Antidepressants (Tricyclic, Tertiary Amine) may enhance the antiplatelet effect of Aspirin. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Beta2-Agonists: Tricyclic Antidepressants may enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

BuPROPion: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Cinacalcet: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Cisapride: Amitriptyline may enhance the arrhythmogenic effect of Cisapride. *Risk X: Avoid combination*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Desmopressin: Tricyclic Antidepressants may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Dexmethylphenidate: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

DULoxetine: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Iobenguane I 123: Tricyclic Antidepressants may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: May enhance the neurotoxic effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the serotonergic effect of Tricyclic Antidepressants. This may cause serotonin syndrome. *Risk X: Avoid combination*

Methylphenidate: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

NSAID (COX-2 Inhibitor): Antidepressants (Tricyclic, Tertiary Amine) may enhance the antiplatelet effect of NSAID (COX-2 Inhibitor). *Risk C: Monitor therapy*

NSAID (Nonselective): Antidepressants (Tricyclic, Tertiary Amine) may enhance the antiplatelet effect of NSAID (Nonselective). *Risk C: Monitor therapy*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Propoxyphene: May enhance the CNS depressant effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Protease Inhibitors: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

QuiNIDine: Tricyclic Antidepressants may enhance the QTc-prolonging effect of QuiNIDine. QuiNIDine may decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

St Johns Wort: May increase the metabolism of Tricyclic Antidepressants. The risk of serotonin syndrome may theoretically be increased. *Risk D: Consider therapy modification*

Sulfonylureas: Cyclic Antidepressants may enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Terbinafine: May decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

TraMADol: Tricyclic Antidepressants may enhance the neuroexcitatory and/or seizure-potentiating effect of TraMADol. *Risk C: Monitor therapy*

Valproic Acid: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Tricyclic Antidepressants may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Grapefruit juice may inhibit the metabolism of some TCAs and clinical toxicity may result.

Herb/Nutraceutical: St John's wort may decrease amitriptyline levels. Avoid valerian, St John's wort, kava kava, gotu kola (may increase CNS depression).

Test InteractionsMay cause false-positive reaction to EMIT immunoassay for imipramine

Monitoring ParametersMonitor blood pressure and pulse rate prior to and during initial therapy; evaluate mental status, suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased); monitor weight; ECG in older adults and patients with cardiac disease

Reference RangeTherapeutic: Amitriptyline and nortriptyline 100-250 ng/mL (SI: 360-900 nmol/L); nortriptyline 50-150 ng/mL (SI: 190-570 nmol/L); Toxic: >0.5 mcg/mL; plasma levels do not always correlate with clinical effectiveness

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions. Assess for suicidal tendencies or unusual changes in behavior before beginning therapy and periodically thereafter. May cause physiological or psychological dependence, tolerance, or abuse; evaluate need for continued use periodically. Caution patients with diabetes; may alter serum glucose levels. Monitor therapeutic response and adverse reactions at beginning of therapy and periodically with long-term use. Taper dosage slowly when discontinuing. Teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake exactly as directed; do not increase dose or frequency. It may take several weeks to achieve desired results. Restrict use of alcohol and caffeine; avoid grapefruit juice. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. If you have diabetes, monitor glucose levels closely; this medication may alter glucose levels. May turn urine blue-green (normal). May cause drowsiness, lightheadedness, impaired coordination, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); constipation (increased exercise, fluids, fruit, or fiber may help); urinary retention (void before taking medication); postural hypotension (use caution climbing stairs or when changing position from lying or sitting to standing); altered sexual drive or ability (reversible); or photosensitivity (use sunscreen, wear protective clothing and eyewear, and avoid direct sunlight). Report persistent CNS effects (eg, nervousness, restlessness, insomnia, headache, agitation, impaired coordination, changes in cognition); suicidal ideation; muscle cramping, weakness, tremors, or rigidity; ringing in ears or visual disturbances; chest pain, palpitations, or irregular heartbeat; blurred vision; or worsening of condition. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptive measures. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet, as hydrochloride: 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Amitriptyline HCl)

25 mg (90): $11.99

50 mg (90): $12.99

75 mg (100): $14.44

100 mg (30): $13.99

150 mg (90): $21.98

Mechanism of ActionIncreases the synaptic concentration of serotonin and/or norepinephrine in the central nervous system by inhibition of their reuptake by the presynaptic neuronal membrane

Pharmacodynamics/Kinetics

Onset of action: Migraine prophylaxis: 6 weeks, higher dosage may be required in heavy smokers because of increased metabolism;
Depression: 4-6 weeks, reduce dosage to lowest effective level

Distribution: Crosses placenta; enters breast milk

Metabolism: Hepatic to nortriptyline (active), hydroxy and conjugated derivatives; may be impaired in the elderly

Half-life elimination: Adults: 9-27 hours (average: 15 hours)

Time to peak, serum: ~4 hours

Excretion: Urine (18% as unchanged drug); feces (small amounts)

Dental Health Professional ConsiderationsAmitriptyline is known to prolong the QT interval. The QT interval is measured as the time and distance between the Q point of the QRS complex and the end of the T wave in the ECG tracing. After adjustment for heart rate, the QT interval is defined as prolonged if it is more than 450 msec in men and 460 msec in women. A long QT syndrome was first described in the 1950s and 60s as a congenital syndrome involving QT interval prolongation and syncope and sudden death. Some of the congenital long QT syndromes were characterized by a peculiar electrocardiographic appearance of the QRS complex involving a premature atria beat followed by a pause, then a subsequent sinus beat showing marked QT prolongation and deformity. This type of cardiac arrhythmia was originally termed “torsade de pointes” (translated from the French as “twisting of the points”).

Prolongation of the QT interval is thought to result from delayed ventricular repolarization. The repolarization process within the myocardial cell is due to the efflux of intracellular potassium. The channels associated with this current can be blocked by many drugs and predispose the electrical propagation cycle to torsade de pointes.

Amitriptyline is considered as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. It is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation), orthostatic hypotension, stomatitis, peculiar taste, and black tongue. Amitriptyline is the most anticholinergic and sedating of the antidepressants; has pronounced effects on the cardiovascular system. Long-term treatment with TCAs such as amitriptyline increases the risk of caries by reducing salivation and salivary buffer capacity. In a study by Rundergren, et al, pathological alterations were observed in the oral mucosa of 72% of 58 patients; 55% had new carious lesions after taking TCAs for a median of $5^{1}/_{2}$ years. Current research is investigating the use of the salivary stimulant pilocarpine (Salagen®) to overcome the xerostomia from amitriptyline.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsAmitriptyline is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution. See Dental Comment.

Mental Health CommentTricyclic antidepressants may be classified as tertiary (amitriptyline, doxepin, clomipramine, imipramine, trimipramine) or secondary amines (nortriptyline, desipramine, protriptyline). The tertiary amines are not recommended to treat depression in the elderly. If a TCA is used in the elderly, it should be a secondary amine. The tertiary amines are commonly used in low dosages for various conditions associated with pain. Toxicity is generally dose dependent. Relatively small overdoses (1-week supply) can be potentially fatal.

Cardiovascular ConsiderationsFrequently, low doses of tricyclics are used for the treatment of muscle cramps, neuralgia, etc. These low doses are not innocuous and may result in resting tachycardia and significant orthostatic hypotension. This is especially a problem in elderly patients on tricyclics and in patients who have coexisting diuretic therapy. Tricyclic antidepressants affect conduction and have anticholinergic effects and, therefore, should be used with caution in patients with underlying cardiovascular disease. Therapy is relatively contraindicated in patients with conduction abnormalities or in patients with symptomatic hypotension. Heart block may be precipitated in patients with pre-existing conduction system disease. Hemodynamics and cardiac conduction should be evaluated during therapy and before dose titration, particularly in patients with cardiovascular disease.

Anesthesia and Critical Care Concerns/Other ConsiderationsDesired therapeutic effect (for analgesia) may take as long as 1-3 weeks. When used for migraine headache prophylaxis, therapeutic effect may take as long as 6 weeks.

Tricyclic antidepressants affect conduction and have anticholinergic effects and, therefore, should be used with caution in patients with underlying cardiovascular disease. Therapy is relatively contraindicated in patients with conduction abnormalities or in patients with symptomatic hypotension. Heart block may be precipitated in patients with pre-existing conduction system disease.

Index TermsAmitriptyline Hydrochloride; Elavil

Amlexanox

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(am LEKS an oks)
U.S. Brand NamesAphthasol®
Pharmacologic CategoryAnti-inflammatory, Locally Applied
Use: Labeled IndicationsTreatment of aphthous ulcers (ie, canker sores)
Use: Unlabeled/InvestigationalAllergic disorders
Use: DentalTreatment of aphthous ulcers (ie, canker sores)
Dosing: AdultsAphthous ulcers: Topical: Administer ~$^{1}/_{4}$ inch (0.5 cm) directly on ulcers 4 times/day following oral hygiene, after meals, and at bedtime.
Dosing: ElderlyRefer to adult dosing.
ContraindicationsHypersensitivity to amlexanox or any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Mucositis: Discontinue therapy if contact mucositis develops.

- Rash: Discontinue therapy if rash develops.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorB
Pregnancy ConsiderationsDue to lack of data, avoid use in pregnancy, if possible.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

1% to 2%:

Dermatologic: Allergic contact dermatitis

Gastrointestinal: Oral irritation

<1%: Contact mucositis

Drug InteractionsThere are no known significant interactions.
Nursing: Physical Assessment/MonitoringAssess knowledge/teach patient appropriate application and use, adverse effects to report, and interventions for side effects.
Patient EducationThis medication is only for treatment of mouth ulcers; do not apply to ulcers of the eye or any other part of the body. Use as directed. Apply after eating. Wash hands before and after use. Brush teeth and rinse mouth before applying directly to ulcers. Squeeze a small amount of paste on your clean finger tip and dab paste onto each ulcer in the mouth, using gentle pressure. Wash eyes immediately if any paste should come into contact with eyes. Notify prescriber or dentist if rash or irritation occurs, or if condition does not improve after 10 days use. **Breast-feeding precaution:** Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Paste, oral:

Aphthasol®: 5% (3 g) [contains benzyl alcohol]

Generic AvailableNo
ManufacturerBlock Drug Co, Inc
Pricing: U.S. (www.drugstore.com)

Paste (Aphthasol)

5% (5): $29.99

Mechanism of ActionAs a benzopyrano-bipyridine carboxylic acid derivative, amlexanox has anti-inflammatory and antiallergic properties; it inhibits chemical mediatory release of the slow-reacting substance of anaphylaxis (SRS-A) and may have antagonistic effects on interleukin-3
Pharmacodynamics/Kinetics

Absorption: Some from swallowed paste

Metabolism: Hydroxylated and conjugated metabolites

Half-life elimination: 3.5 hours

Time to peak, serum: 2 hours

Excretion: Urine (17% as unchanged drug)

Dental Health Professional Considerations Treatment of canker sores with amlexanox showed a 76% median reduction in ulcer size compared to a 40% reduction with placebo. Greer, et al, reported an overall mean reduction in ulcer size of 1.82 mm^2 for patients treated with 5% amlexanox versus an average reduction of 0.52 mm^2 for the control group. Recent studies in over thousands of patients have confirmed that amlexanox accelerates the resolution of pain and healing of aphthous ulcers more significantly than vehicle and no treatment.

Dental Health: Effects on Dental Treatment Key adverse event(s) related to dental treatment: Allergic contact dermatitis and oral irritation. Discontinue therapy if rash or contact mucositis develops (see Dental Comment).

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment None reported

HMG-CoA Reductase Inhibitors: Evidence Does Not Suggest Increased Incidence of Amyotrophic Lateral Sclerosis (ALS) - Results of FDA Analysis - September 30, 2008

The U.S. Food and Drug Administration's (FDA) review of 41 long-term controlled clinical trials of HMG-CoA reductase inhibitors finds no evidence of an increased incidence of ALS (also known as Lou Gehrig's disease) related to these medications. This analysis occurred after the FDA had received notice of numerous adverse events of which 109 of these reports mentioned ALS, Lou Gehrig's disease, or motor neurone disease. The clinical trials included in the analysis had a median duration of treatment of 3.3 years (range of duration: 6 months to 5 years) and involved 120,964 patients. The analysis identified a total of 19 cases of ALS – 9 cases per 64,602 patients (0.014%) with statin therapy and 10 cases per 56,362 patients (0.017%) with placebo. The incidence rates, based on approximately 400,000 person-years, were 4.2 per 100,000 person-years in the statin-treated group and 5 per 100,000 person-years in the placebo-treated group.

The FDA recommends that health care providers continue to prescribe, and patients continue to use these products as described within their labeling.

For more information, healthcare professionals may refer to the following:

http://www.fda.gov/medwatch/safety/2008/safety08.htm#Statin

Colman E, Szarfman A, Wyeth J, et al, "An Evaluation of a Data Mining Signal for Amyotrophic Lateral Sclerosis and Statins Detected in FDA's Spontaneous Adverse Event Reporting System," *Pharmacoepidemiol Drug Saf*, 2008 (epub ahead of print)

Pronunciation(am LOW di peen & a TORE va sta tin)

U.S. Brand NamesCaduet®

Canadian Brand NamesCaduet®

Pharmacologic CategoryAntilipemic Agent, HMG-CoA Reductase Inhibitor; Calcium Channel Blocker

Use: Labeled IndicationsFor use when treatment with both amlodipine and atorvastatin is appropriate:

Amlodipine: Treatment of hypertension; treatment of symptomatic chronic stable angina, vasospastic (Prinzmetal's) angina (confirmed or suspected); prevention of hospitalization due to angina with documented CAD (limited to patients without heart failure or ejection fraction <40%)

Atorvastatin: Treatment of dyslipidemias or primary prevention of cardiovascular disease (atherosclerotic) as detailed here:

Primary prevention of cardiovascular disease (high-risk for CVD): To reduce the risk of MI or stroke in patients without evidence of heart disease who have multiple CVD risk factors or type 2 diabetes. Treatment reduces the risk for angina or revascularization procedures in patients with multiple risk factors.

Treatment of dyslipidemias: To reduce elevations in total cholesterol, LDL-C, apolipoprotein B, and triglycerides in patients with elevations of one or more components, and/or to increase HDL-C as present in heterozygous hypercholesterolemia (Fredrickson type IIa hyperlipidemias); treatment of primary dysbetalipoproteinemia (Fredrickson type III), elevated serum TG levels (Fredrickson type IV), and homozygous familial hypercholesterolemia

Treatment of heterozygous familial hypercholesterolemia (HeFH) in adolescent patients (10-17 years of age, females >1 year postmenarche) having LDL-C ≥190 mg/dL or LDL-C ≥160 mg/dL with positive family history of premature cardiovascular disease (CVD) or with two or more CVD risk factors.

Dosing: Adults

Amlodipine:

Hypertension: Oral: Initial dose: 5 mg once daily; maximum dose: 10 mg once daily; in general, titrate in 2.5 mg increments over 7-14 days. Usual dosage range (JNC 7): 2.5-10 mg once daily

Angina: Oral: Usual dose: 5-10 mg; lower dose suggested in elderly or hepatic impairment; most patients require 10 mg for adequate effect

Atorvastatin:

Hyperlipidemias: Oral: Initial: 10-20 mg once daily; patients requiring >45% reduction in LDL-C may be started at 40 mg once daily; range: 10-80 mg once daily

Primary prevention of CVD: Oral: 10 mg once daily

Dosing: ElderlyRefer to adult dosing.

Amlodipine: Dosing should start at the lower end of dosing range due to possible increased incidence of hepatic, renal, or cardiac impairment. Elderly patients also show decreased clearance of amlodipine.

Hypertension: 2.5 mg once daily

Angina: 5 mg once daily

Dosing: Pediatric

Hypertension:*Amlodipine:* Oral: Children >10 years: 2.5-5 mg once daily. **Note:** Use in ages >10 years because of atorvastatin content.

HeFH:*Atorvastatin:* Oral: Children 10-17 years (females >1 year postmenarche): 10 mg once daily (maximum: 20 mg/day)

Dosing: Renal ImpairmentNo dosage adjustment is necessary.

Dosing: Hepatic ImpairmentDo not use in active liver disease.

Administration: OralMay be administered without regard to meals.

Dietary ConsiderationsMay take with food if desired; may take without regard to time of day. Before initiation of therapy with atorvastatin, patients should be placed on a standard cholesterol-lowering diet for 3-6 months and the diet should be continued during drug therapy. Red yeast rice contains an estimated 2.4 mg lovastatin per 600 mg rice.

StorageStore at controlled room temperature 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to amlodipine, atorvastatin, or any component of the formulation; active liver disease; unexplained persistent elevations of serum transaminases; pregnancy

Allergy Considerations

- Calcium Channel Blocker, Dihydropyridine Allergy
- HMG-CoA Reductase Inhibitor Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Angina/MI: Increased angina and/or MI has occurred with initiation or dosage titration of calcium channel blockers.

- Myopathy/rhabdomyolysis: Patients receiving HMG-CoA reductase inhibitors have developed rhabdomyolysis with acute renal failure and/or myopathy; patients should be monitored closely. This risk is dose-related and is increased with concurrent use of other lipid lowering medications. Temporarily discontinue for elective major surgery, acute medical or surgical conditions, or in any patient experiencing an acute or serious condition predisposing to renal failure (eg, sepsis, hypotension, trauma, uncontrolled seizures). Based upon current evidence, HMG-CoA reductase inhibitor therapy should be continued in the perioperative period unless risk outweighs cardioprotective benefit. Use caution in patients with renal impairment, inadequately treated hypothyroidism, and those taking other drugs associated with myopathy (eg, colchicine); these patients are predisposed to myopathy. Patients should be instructed to report unexplained muscle pain, tenderness, weakness, or brown urine.

Disease-related concerns:

- Aortic stenosis: Use amlodipine with caution in patients with severe aortic stenosis.

- Hepatic impairment and/or ethanol use: Use atorvastatin with caution in patients who consume large amounts of ethanol or have a history of liver disease.

Concurrent drug therapy issues:

- High potential for interactions: Use atorvastatin with caution in patients taking strong CYP3A4 inhibitors (see drug interactions); consider alternative agents that avoid or lessen potential for CYP-mediated interactions.

Special populations:

- Elderly: Use atorvastatin with caution in patients with advanced age, these patients are predisposed to myopathy.

- Pediatrics: Safety and efficacy of the combination of amlodipine/atorvastatin have not been established in children. Safety and efficacy of amlodipine have not been established in patients <6 years of age. Safety and efficacy of atorvastatin have not been established in patients <10 years of age or in premenarcheal girls.

Other warnings/precautions:

- Hyperlipidemia: Secondary causes of hyperlipidemia should be ruled out prior to therapy with atorvastatin.

- Liver function tests: Must be monitored by periodic laboratory assessment while taking atorvastatin.

- Titration: Dosage titration of amlodipine should occur after 7-14 days on a given dose.

Pregnancy Risk FactorX

Pregnancy ConsiderationsSee individual agents.

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsSee individual agents.

Adverse ReactionsSee individual agents.

Metabolism/Transport Effects

Amlodipine: **Substrate** of CYP3A4 (major); **Inhibits** CYP1A2 (moderate), 2A6 (weak), 2B6 (weak), 2C8 (weak), 2C9 (weak), 2D6 (weak), 3A4 (weak)

Atorvastatin: **Substrate** of CYP3A4 (major); **Inhibits** CYP3A4 (weak)

Drug Interactions

Aliskiren: Atorvastatin may increase the serum concentration of Aliskiren. *Risk C: Monitor therapy*

Alpha1-Blockers: May enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Amiodarone: May decrease the metabolism of HMG-CoA Reductase Inhibitors. Management: Dose of HMG-CoA reductase inhibitor may need to be reduced (e.g., simvastatin prescribing information recommends not exceeding 20 mg/day during concurrent therapy). *Risk D: Consider therapy modification*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Bosentan: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Calcium Channel Blockers (Nondihydropyridine): May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Calcium Channel Blockers (Dihydropyridine). Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk C: Monitor therapy*

Calcium Salts: May diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk C: Monitor therapy*

Clopidogrel: Atorvastatin may diminish the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

Clopidogrel: Calcium Channel Blockers may diminish the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

Colchicine: May enhance the myopathic (rhabdomyolysis) effect of HMG-CoA Reductase Inhibitors. Colchicine may increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

CycloSPORINE: May increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

CycloSPORINE: May decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). Nicardipine may likewise inhibit the metabolism of cyclosporine. Cyclosporine dosage adjustments might be needed. *Risk C: Monitor therapy*

CYP1A2 Substrates: CYP1A2 Inhibitors (Moderate) may decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dabigatran Etexilate: Atorvastatin may decrease the serum concentration of Dabigatran Etexilate. *Risk C: Monitor therapy*

Danazol: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

DAPTOmycin: HMG-CoA Reductase Inhibitors may enhance the adverse/toxic effect of DAPTOmycin. Specifically, the risk of skeletal muscle toxicity may be increased. Management: Consider temporarily stopping HMG-CoA reductase inhibitor therapy prior to daptomycin. If used together, regular (i.e., at least weekly) monitoring of CPK concentrations is recommended. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Digoxin: Atorvastatin may increase the serum concentration of Digoxin. *Risk C: Monitor therapy*

Etravirine: May decrease the serum concentration of HMG-CoA Reductase Inhibitors. This applies to atorvastatin, lovastatin and simvastatin. Conversely, levels of fluvastatin may be increased. Management: Dose adjustment of the HMG-CoA reductase inhibitor may be warranted. No interaction is expected with rosuvastatin or pravastatin. *Risk C: Monitor therapy*

Fenofibrate: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Fluconazole: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Gemfibrozil: May enhance the myopathic (rhabdomyolysis) effect of HMG-CoA Reductase Inhibitors. Gemfibrozil may increase the serum concentration of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Grapefruit Juice: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Grapefruit Juice: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of HMG-CoA Reductase Inhibitors. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Macrolide Antibiotics: May decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Magnesium Salts: Calcium Channel Blockers may enhance the adverse/toxic effect of Magnesium Salts. Magnesium Salts may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Midazolam: Atorvastatin may increase the serum concentration of Midazolam. *Risk C: Monitor therapy*

Nafcillin: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Nefazodone: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents (Nondepolarizing): Calcium Channel Blockers may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Niacin: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Niacinamide: May enhance the adverse/toxic effect of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Nitroprusside: Calcium Channel Blockers may enhance the hypotensive effect of Nitroprusside. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Substrates: P-Glycoprotein Inhibitors may increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: Calcium Channel Blockers may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Phenytoin: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Protease Inhibitors: May increase the serum concentration of HMG-CoA Reductase Inhibitors. Limited data suggest pravastatin may slightly decrease protease inhibitor concentrations. Management: Lovastatin and simvastatin are contraindicated with many protease inhibitors; use lowest possible HMG-CoA reductase inhibitor dose and monitor for signs and symptoms of rhabdomyolysis if these agents are used concomitantly. *Risk D: Consider therapy modification*

Protease Inhibitors: May decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk D: Consider therapy modification*

QuiNIDine: Calcium Channel Blockers (Dihydropyridine) may decrease the serum concentration of QuiNIDine. *Risk C: Monitor therapy*

Quinupristin: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Calcium Channel Blockers. This primarily affects oral forms of calcium channel blockers. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Rivaroxaban: P-Glycoprotein Inhibitors may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Sildenafil: May decrease the metabolism of HMG-CoA Reductase Inhibitors. *Risk D: Consider therapy modification*

St Johns Wort: May increase the metabolism of HMG-CoA Reductase Inhibitors. *Risk C: Monitor therapy*

Tacrolimus: Calcium Channel Blockers (Dihydropyridine) may increase the serum concentration of Tacrolimus. *Risk C: Monitor therapy*

Topotecan: P-Glycoprotein Inhibitors may increase the serum concentration of Topotecan. *Risk X: Avoid combination*

⬆ Ethanol/Nutrition/Herb InteractionsSee individual agents.
⬆ Monitoring ParametersBlood pressure; lipid levels after 2-4 weeks, CPK, liver function tests (LFTs); it is recommended that LFTs be performed prior to and at 12 weeks following both the initiation of therapy and any elevation in dose of atorvastatin, and periodically (eg,

semiannually) thereafter.

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsSee individual components listed in Related Information.

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Mechanism of Action

Amlodipine: Inhibits calcium ion from entering the “slow channels” or select voltage-sensitive areas of vascular smooth muscle and myocardium during depolarization, producing a relaxation of coronary vascular smooth muscle and coronary vasodilation; increases myocardial oxygen delivery in patients with vasospastic angina

Atorvastatin: Inhibitor of 3-hydroxy-3-methylglutaryl coenzyme A (HMG-CoA) reductase, the rate limiting enzyme in cholesterol synthesis (reduces the production of mevalonic acid from HMG-CoA); this then results in a compensatory increase in the expression of LDL receptors on hepatocyte membranes and a stimulation of LDL catabolism

Pharmacodynamics/KineticsSee individual agents.

Related Information

- AmLODIPine
- Atorvastatin

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Fewer reports of gingival hyperplasia with amlodipine than with other calcium channel blockers (usually resolves upon discontinuation); consultation with physician is suggested.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness; may rarely produce insomnia, nervousness, or euphoria

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular Considerations

Amlodipine:

Hypertension: Amlodipine therapy should be continued for 4-6 weeks before the dose is increased. Daily doses >10 mg are associated with an increase in side effects (eg, edema) without further reductions in blood pressure. The ALLHAT study (ALLHAT Collaborative Group, 2002) compared CV outcomes of lisinopril, amlodipine, or chlorthalidone in hypertensive patients having at least one other risk factor for coronary heart disease. Investigators found no difference between the groups on the primary outcome of fatal coronary disease or nonfatal MI. The ASCOT-BPLA trial evaluated two regimens (calcium channel blocker/ACE inhibitor vs beta-blocker/thiazide diuretic) to test their efficacy in the primary prevention of coronary disease (nonfatal MI and fatal coronary artery disease). Patients 40-79 years of age were recruited; their blood pressures were either >160 systolic or >100 diastolic (untreated) or >140 systolic or >90 diastolic (treated). Treatment with a calcium channel blocker/ACE inhibitor was more effective at reducing cardiovascular outcomes than the beta-blocker/diuretic regimen.

Coronary artery disease: The Comparison of Amlodipine versus Enalapril to Limit Occurrences of Thrombosis (CAMELOT) trial compared a calcium channel blocker and ACE inhibitor in normotensive patients with coronary artery disease (Nissen, 2004). The primary outcome of CV events occurred in 151 (23.1%: placebo), 110 (16.6%: amlodipine), and 136 (20.2%: enalapril) of the patients. The only significant difference being a reduction in CV events with amlodipine compared with placebo, mainly representing a reduction in coronary revascularization and hospitalizations for angina with amlodipine. In the treatment of unstable angina/non-ST-segment elevation MI, oral long-acting calcium antagonists may also be considered in addition to beta-blockers and nitrates.

Heart failure: The ACC/AHA 2005 guidelines for management of heart failure state that calcium channel blockers are not indicated for the routine treatment of heart failure patients with current/prior symptoms of heart failure and reduced LVEF. Only amlodipine has been shown not to adversely affect survival, but most experience is not in patients on concurrent beta-blockers.

Atorvastatin:

HMG-CoA reductase inhibitors are effective in primary and secondary prevention of cardiovascular events in patients with hyperlipidemia. For primary prevention, a patient's major risk factors (cigarette smoking, hypertension or currently taking antihypertensives, low HDL-C, family history, age, gender) should be evaluated. Patients with multiple risk factors (≥2) require more intensive therapy guided by the calculation of a 10-year absolute CHD risk (eg, the percent probability of having a CHD event in next 10 years). An individual's 10-year absolute CHD risk can be calculated at www.med-decisions.com/cvtool/phys/phys.html. LDL cholesterol goals, therapeutic lifestyle changes, and drug therapy are determined based upon a patient's risk factor profile.

Primary prevention trials show that cholesterol-lowering drugs reduce the risk of major coronary events, coronary death, and cerebrovascular events even in the first 6-12 months of use. The WOSCOP trial suggested a trend towards enhanced survival using pravastatin in their patients (mean LDL-cholesterol of 192 mg/dL and no history of MI). In a recent trial (Sever PS, 2003), patients with HTN and at least three other risk factors were randomized to 10 mg daily of atorvastatin or placebo. These patients had a total nonfasting cholesterol <250 mg/dL before treatment. LDL-C levels were 132 mg/dL before treatment and fell to an average of 90 mg/dL in the atorvastatin-treated group. There was a significant reduction in stroke, cardiovascular events, and coronary events in the atorvastatin-treated group as compared to the placebo group. There was no difference in mortality between the groups.

Secondary prevention trials indicate that “statin” therapy reduces mortality, major coronary events, coronary artery procedures, and stroke. The Heart Protection Study proved that lowering serum cholesterol levels reduces the rate of major vascular events among high-risk individuals with documented vascular disease (CHD, cerebrovascular, peripheral vascular) or diabetes regardless of initial cholesterol concentrations. PROVE IT is a randomized, double-blind trial evaluating hospitalized patients with acute coronary syndrome to determine the effects of intense LDL-C lowering therapy. Four thousand patients with an LDL-C levels of 106 mg/dL were randomized to pravastatin 40 mg daily or atorvastatin 80 mg daily. After 2 years, the combined cardiovascular endpoint (death, MI, unstable angina requiring hospitalization, revascularization and stroke) was ~26% in the pravastatin patients (median LDL-C 95 mg/dL) and ~22% in the atorvastatin treated patients (median LDL-C 62 mg/dL).

LaRosa and colleagues assessed the efficacy and safety of lowering LDL cholesterol <100 mg/dL in patients with stable coronary heart disease (LaRosa JC, 2005). Ten thousand and one patients with baseline LDL levels <130 mg/dL were randomized to atorvastatin 10 mg or 80 mg daily and followed for a median of 4.9 years. The primary endpoint was the occurrence of the first major cardiovascular event (death from CVD, MI, resuscitation after cardiac arrest, or stroke). A primary event occurred in 434 patients (8.7%) receiving 80 mg daily (mean LDL 77 mg/dL) and 548 patients (10.9%) receiving 10 mg dose (mean LDL 101 mg/dL) (95% CI, 0.69-0.89; p <0.001). There was no mortality difference between the two treatment groups.

HMG-CoA reductase inhibitors decrease levels of high-sensitivity C-reactive protein (hs-CRP). They also possess pleiotropic properties including improved endothelial function, reduced inflammation at the site of the coronary plaque, inhibition of platelet aggregation, and anticoagulant effects. These nonlipid effects may be beneficial when HMG-CoA reductase inhibitors are introduced early in the management of acute coronary syndromes (de Denus S, 2002).

Myopathy: Currently-marketed HMG-CoA reductase inhibitors appear to have a similar potential for causing myopathy. Incidence of severe myopathy is about 0.08% to 0.09%. The factors that increase risk include advanced age (especially >80 years of age), women more frequently than men, small body frame, frailty, multisystem disease (eg, chronic renal insufficiency especially due to diabetes), multiple medications, drug interactions (use with caution or avoid). The combination of a HMG-CoA reductase inhibitor plus nicotinic acid seems to carry a lower risk of myopathy than does a HMG-CoA reductase inhibitor plus a fibrate. Other medications, when used concurrently, may enhance the risk of myopathy associated with statins; these include drugs that inhibit CYP3A4 isoenzymes (lovastatin, simvastatin, atorvastatin) or CYP2C9 isoenzymes (fluvastatin). HMG-CoA reductase inhibitors may exacerbate exercise-induced skeletal muscle injury. Many experts favor getting a baseline creatine kinase (CK) measurement before initiating therapy (asymptomatic CK elevations are common). Obtain a CK measurement if patient complains of muscle soreness, tenderness, or pain.

Anesthesia and Critical Care Concerns/Other ConsiderationsBased on the atorvastatin component: **Myopathy:** Currently-marketed HMG-CoA reductase inhibitors appear to have a similar potential for causing myopathy. Incidence of severe myopathy is about 0.08% to 0.09%. The factors that increase risk include advanced age (especially >80 years), gender (occurs in women more frequently than men), small body frame, frailty, multisystem disease (eg, chronic renal insufficiency especially due to diabetes), multiple medications, and drug interactions (use with caution or avoid).

Based on current research, HMG-CoA reductase inhibitors should be continued in the perioperative period. Postoperative discontinuation of statin therapy is associated with an increased risk of cardiac morbidity and mortality.

Index Terms Atorvastatin Calcium and Amlodipine Besylate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(am LOE di peen & ben AY ze pril)

U.S. Brand NamesLotrel®

Pharmacologic CategoryAngiotensin-Converting Enzyme (ACE) Inhibitor; Calcium Channel Blocker

Use: Labeled IndicationsTreatment of hypertension

Dosing: AdultsHypertension: Oral: 2.5-10 mg (amlodipine) and 10-40 mg (benazepril) once daily; maximum: Amlodipine: 10 mg/day; benazepril: 40 mg/day

Dosing: ElderlyInitial dose: 2.5 mg (based on amlodipine component). Refer to adult dosing.

Dosing: Renal ImpairmentCl_{cr} ≤30 mL/minute: Use of combination product is not recommended.

Dosing: Hepatic ImpairmentInitial dose: 2.5 mg based on amlodipine component.

Calculations

- Creatinine Clearance: Adults

ContraindicationsHypersensitivity to amlodipine, benazepril, other ACE inhibitors, or any component of the formulation

Allergy Considerations

- ACE Inhibitor Allergy/Hypersensitivity
- Calcium Channel Blocker, Dihydropyridine Allergy

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Angina/MI: With initiation or dosage titration of dihydropyridine calcium channel blockers; reflex tachycardia may occur resulting in angina and/or MI (rare) in patients with obstructive coronary disease (especially in the absence of concurrent beta-blockade).

- Angioedema: At any time during treatment (especially following first dose) angioedema may occur rarely with ACE inhibitors; it may involve the head and neck (potentially compromising airway) or the intestine (presenting with abdominal pain). African-Americans and patients with idiopathic or hereditary angioedema or previous angioedema associated with ACE inhibitor therapy may be at an increased risk. Prolonged frequent monitoring may be required especially if tongue, glottis, or larynx are involved as they are associated with airway obstruction. Patients with a history of airway surgery may have a higher risk of airway obstruction. Aggressive early and appropriate management is critical.

- Cholestatic jaundice: A rare toxicity associated with ACE inhibitors includes cholestatic jaundice, which may progress to fulminant hepatic necrosis; discontinue if marked elevation of hepatic transaminases or jaundice occurs.

- Cough: An ACE inhibitor cough is a dry, hacking, nonproductive one that usually occurs within the first few months of treatment and should generally resolve within 1-4 weeks after discontinuation of the ACE inhibitor. Other causes of cough should be considered (eg, pulmonary congestion in patients with heart failure) and excluded prior to discontinuation.

- Hyperkalemia: May occur with ACE inhibitors; risk factors include renal dysfunction, diabetes mellitus, concomitant use of potassium-sparing diuretics, potassium supplements and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely.

- Hypersensitivity reactions: Anaphylactic/anaphylactoid reactions can occur with ACE inhibitors. Severe anaphylactoid reactions may be seen during hemodialysis (eg, CVVHD) with high-flux dialysis membranes (eg, AN69), and rarely, during low density lipoprotein apheresis with dextran sulfate cellulose. Rare cases of anaphylactoid reactions have been reported in patients undergoing sensitization treatment with hymenoptera (bee, wasp) venom while receiving ACE inhibitors.

- Hypotension/syncope: Symptomatic hypotension with or without syncope can occur with ACE inhibitors (usually with the first several doses); effects are most often observed in volume-depleted patients; correct volume depletion prior to initiation; close monitoring of patient is required especially with initial dosing and dosing increases; blood pressure must be lowered at a rate appropriate for the patient's clinical condition. Although dose reduction may be necessary, hypotension is not a reason for discontinuation of future ACE inhibitor use especially in patients with heart failure where a reduction in systolic blood pressure is a desirable observation.

- Neutropenia/agranulocytosis: Another ACE Inhibitor, captopril, has been associated with rare cases of agranulocytosis, neutropenia, or leukopenia with myeloid hypoplasia. Patients with renal impairment are at high risk of developing neutropenia. Patients with both renal impairment and collagen vascular disease (eg, systemic lupus erythematosus) are at an even higher risk of developing neutropenia. Periodically monitor CBC with differential in these patients.

- Peripheral edema: The most common side effect of amlodipine is peripheral edema (dose dependent); occurs within 2-3 weeks of starting therapy.

- Renal function deterioration: May be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

Disease-related concerns:

- Aortic stenosis: Use with extreme caution in patients with severe aortic stenosis; may reduce coronary perfusion resulting in ischemia.

- Cardiovascular disease: Initiation of therapy in patients with ischemic heart disease or cerebrovascular disease warrants close observation due to the potential consequences posed by falling blood pressure (eg, MI, stroke). Fluid replacement, if needed, may restore blood pressure; therapy may then be resumed. Discontinue therapy in patients whose hypotension recurs.

- Collagen vascular disease: Use benazepril with caution in patients with collagen vascular disease especially with concomitant renal impairment; may be at increased risk for hematologic toxicity.

- Hepatic impairment: Use amlodipine with caution in patients with hepatic impairment; may require lower starting dose.

- Hypertrophic cardiomyopathy (HCM) with outflow tract obstruction: Use with caution in patients with HCM and outflow tract obstruction since reduction in afterload may worsen symptoms associated with this condition.

- Renal artery stenosis: Use benazepril with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use benazepril with caution in pre-existing renal insufficiency; dosage adjustment may be needed. Patients with renal impairment may be at increased risk for hematologic toxicity. Avoid rapid dosage escalation which may lead to further renal impairment.

Special populations:

- Elderly: Initiate amlodipine at a lower dose in the elderly.

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, ACEIs can cause injury and death to the developing fetus when used in the second and third trimesters. ACEIs should be discontinued as soon as possible once pregnancy is detected.**

Other warnings/precautions:

- Appropriate use: Used as a replacement for separate dosing of components or combination therapy when response to single agent is suboptimal; the fixed combination is not indicated for initial treatment of hypertension.

- Surgery: Use with caution before, during, or immediately after major surgery. Cardiopulmonary bypass, intraoperative blood loss or vasodilating anesthesia increases endogenous renin release. Use of ACE inhibitors perioperatively will blunt angiotensin II formation and may result in hypotension.

Geriatric ConsiderationsCombination products are not recommended as first-line treatment. Only use if doses of individual agents correspond to the combination available.
Pregnancy Risk FactorC/D (2nd and 3rd trimesters)
Pregnancy ConsiderationsSee individual agents.
Lactation

Amlodipine: Excretion in breast milk unknown

Benazepril: Enters breast milk

Adverse ReactionsSee individual agents.
Metabolism/Transport EffectsAmlodipine: **Substrate** of CYP3A4 (major); **Inhibits** CYP1A2 (moderate), 2A6 (weak), 2B6 (weak), 2C8 (weak), 2C9 (weak), 2D6 (weak), 3A4 (weak)
Drug Interactions

Allopurinol: ACE Inhibitors may enhance the potential for allergic or hypersensitivity reactions to Allopurinol. *Risk D: Consider therapy modification*

Alpha1-Blockers: May enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Angiotensin II Receptor Blockers: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Antacids: May decrease the serum concentration of ACE Inhibitors. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Aprotinin: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

AzaTHIOprine: ACE Inhibitors may enhance the neutropenic effect of AzaTHIOprine. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Calcium Channel Blockers (Dihydropyridine). Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk C: Monitor therapy*

Calcium Salts: May diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk C: Monitor therapy*

Clopidogrel: Calcium Channel Blockers may diminish the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

CycloSPORINE: ACE Inhibitors may enhance the nephrotoxic effect of CycloSPORINE. *Risk D: Consider therapy modification*

CycloSPORINE: May decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). Nicardipine may likewise inhibit the metabolism of cyclosporine. Cyclosporine dosage adjustments might be needed. *Risk C: Monitor therapy*

CYP1A2 Substrates: CYP1A2 Inhibitors (Moderate) may decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Ferric Gluconate: ACE Inhibitors may enhance the adverse/toxic effect of Ferric Gluconate. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Gold Sodium Thiomalate: ACE Inhibitors may enhance the adverse/toxic effect of Gold Sodium Thiomalate. An increased risk of nitritoid reactions has been appreciated. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: ACE Inhibitors may increase the serum concentration of Lithium. *Risk D: Consider therapy modification*

Loop Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Loop Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Macrolide Antibiotics: May decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Magnesium Salts: Calcium Channel Blockers may enhance the adverse/toxic effect of Magnesium Salts. Magnesium Salts may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nafcillin: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents (Nondepolarizing): Calcium Channel Blockers may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Nitroprusside: Calcium Channel Blockers may enhance the hypotensive effect of Nitroprusside. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Phenytoin: Calcium Channel Blockers may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Potassium Salts: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk D: Consider therapy modification*

QuiNIDine: Calcium Channel Blockers (Dihydropyridine) may decrease the serum concentration of QuiNIDine. *Risk C: Monitor therapy*

Quinupristin: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Calcium Channel Blockers. This primarily affects oral forms of calcium channel blockers. *Risk D: Consider therapy modification*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Salicylates: May diminish the antihypertensive effect of ACE Inhibitors. They may also diminish other beneficial pharmacodynamic effects desired for the treatment of CHF. The effects are likely dose-related. 100 mg doses aspirin appear to cause no problems, whereas 300 mg doses appear to significantly affect ACE Inhibitor efficacy. *Risk C: Monitor therapy*

Sirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Tacrolimus: Calcium Channel Blockers (Dihydropyridine) may increase the serum concentration of Tacrolimus. *Risk C: Monitor therapy*

Temsirolimus: May enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Thiazide Diuretics: May enhance the hypotensive effect of ACE Inhibitors. Specifically, postural hypotension which can accompany ACE Inhibitor initiation. Thiazide Diuretics may enhance the nephrotoxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Trimethoprim: May enhance the hyperkalemic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Monitoring ParametersBUN, electrolytes, serum creatinine, and blood pressure. In patients with renal impairment and/or collagen vascular disease, monitor CBC with differential periodically.

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsBUN, electrolytes, and serum creatinine; in patients with renal impairment and/or collagen vascular disease, monitor CBC with differential periodically

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

2.5/10: Amlodipine 2.5 mg and benazepril hydrochloride 10 mg

5/10: Amlodipine 5 mg and benazepril hydrochloride 10 mg

5/20: Amlodipine 5 mg and benazepril hydrochloride 20 mg

10/20: Amlodipine 10 mg and benazepril hydrochloride 20 mg

Lotrel® 2.5/10: Amlodipine 2.5 mg and benazepril hydrochloride 10 mg

Lotrel® 5/10: Amlodipine 5 mg and benazepril hydrochloride 10 mg

Lotrel® 5/20: Amlodipine 5 mg and benazepril hydrochloride 20 mg

Lotrel® 5/40: Amlodipine 5 mg and benazepril hydrochloride 40 mg

Lotrel® 10/20: Amlodipine 10 mg and benazepril hydrochloride 20 mg

Lotrel® 10/40: Amlodipine 10 mg and benazepril hydrochloride 40 mg

Generic AvailableYes

5-20 mg (30): $92.99

5-40 mg (30): $96.99

10-20 mg (30): $109.99

10-40 mg (30): $115.99

Mechanism of ActionThe mechanism through which benazepril lowers blood pressure is believed to be primarily suppression of the renin-angiotensin-aldosterone system; benazepril has an antihypertensive effect even in patients with low-renin hypertension; amlodipine is a dihydropyridine calcium antagonist that inhibits the transmembrane influx of calcium ions into vascular smooth muscle and cardiac muscle; amlodipine is a peripheral arterial vasodilator that acts directly on vascular smooth muscle to cause a reduction in peripheral vascular resistance and reduction in blood pressure

Pharmacodynamics/Kinetics See individual agents.

Related Information

- AmLODIPine
- Benazepril

Dental Health: Effects on Dental Treatment Fewer reports of gingival hyperplasia with amlodipine than with other CCBs (usually resolves upon discontinuation); consultation with physician is suggested.

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status May cause drowsiness; rarely may produce insomnia and nervousness

Mental Health: Effects on Psychiatric Treatment May decrease lithium clearance resulting in an increase in serum lithium levels and potential lithium toxicity; monitor serum lithium levels

Index Terms Benazepril Hydrochloride and Amlodipine Besylate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(am LOE di peen & olme SAR tan)

U.S. Brand NamesAzor™

Pharmacologic CategoryAngiotensin II Receptor Blocker; Calcium Channel Blocker

Use: Labeled IndicationsTreatment of hypertension

Dosing: AdultsHypertension: Oral: Amlodipine 5-10 mg and olmesartan 20-40 mg once daily; dose may be titrated after 2 weeks of therapy. Maximum recommended dose: Amlodipine 10 mg/day; olmesartan 40 mg/day.

Dosing: ElderlyRefer to adult dosing. Initiate at lower end of dosing range.

Dosing: Renal ImpairmentNo specific guidelines for dosage adjustment.

Dosing: Hepatic ImpairmentUse caution in hepatic impairment; amlodipine and olmesartan exposure increased in presence of hepatic impairment.

Administration: OralAdminister with or without food.

Dietary ConsiderationsAvoid salt substitutes which contain potassium. May be taken with or without food.

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F).

ContraindicationsThere are no contraindications listed in manufacturer's labeling.

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Angina/MI: Increased angina and/or MI has occurred with initiation or dosage titration of calcium channel blockers. Use caution with severe obstructive CAD.
- Hyperkalemia: May occur with olmesartan use; risk factors include renal dysfunction, diabetes mellitus, concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely.
- Hypotension/syncope: Symptomatic hypotension with or without syncope can rarely occur; use caution during initiation of therapy, particularly in patients with heart failure, severe aortic stenosis, post-MI patients, volume- or salt-depleted patients, or those undergoing surgery or dialysis.
- Peripheral edema: The most common side effect of amlodipine is peripheral edema; occurs within 2-3 weeks of starting therapy.
- Reflex tachycardia: May occur with amlodipine use.
- Renal function deterioration: Olmesartan may be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

Disease-related concerns:

- Aortic/mitral stenosis: Use with caution in patients with significant aortic/mitral stenosis.
- Heart failure: Use caution when initiating in heart failure; may need to adjust dose, and/or concurrent diuretic therapy.
- Hepatic impairment: Use with caution in patients with hepatic impairment; amlodipine and olmesartan exposure increased in hepatic dysfunction.
- Hypovolemia: Avoid use or use a smaller dose in patients who are volume depleted; correct depletion first.
- Renal artery stenosis: Use olmesartan with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.
- Renal impairment: Use with caution with pre-existing renal insufficiency and severe renal impairment.

Special populations:

- Elderly: Initiate at a lower dose in the elderly.
- Pediatrics: Safety and efficacy of this combination have not been established in children.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, drugs that act on the angiotensin system can cause injury and death to the developing fetus when used in the second and third trimesters. Angiotensin receptor blockers should be discontinued as soon as possible once pregnancy is detected.**

Other warnings/precautions:

- Appropriate use: Combination product is not indicated for initial therapy of hypertension.

- Titration: Dosage titration may occur after 2-4 weeks if blood pressure control inadequate. This may be done by increasing one component at a time or by increasing both components to achieve more rapid control of blood pressure.

Geriatric ConsiderationsSee individual agents.
Pregnancy Risk FactorC/D (2nd and 3rd trimesters)
Pregnancy ConsiderationsSee individual agents.
LactationExcretion in breast milk unknown/not recommended
Breast-Feeding ConsiderationsSee individual agents.
Adverse ReactionsReactions/percentages reported with combination product; also refer to individual agents

>10%: Cardiovascular: Peripheral edema (dose related: 18% to 26%)

Frequency not defined (limited to important or life-threatening): Hypotension, nocturia, orthostatic hypotension, palpitation, pruritus, rash, urinary frequency

Metabolism/Transport EffectsAmlodipine: **Substrate** of CYP3A4 (major); **Inhibits** CYP1A2 (moderate), 2A6 (weak), 2B6 (weak), 2C8 (weak), 2C9 (weak), 2D6 (weak), 3A4 (weak)
Drug Interactions

ACE Inhibitors: Angiotensin II Receptor Blockers may enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Alpha1-Blockers: May enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Calcium Channel Blockers (Dihydropyridine). Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk C: Monitor therapy*

Calcium Salts: May diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk C: Monitor therapy*

Clopidogrel: Calcium Channel Blockers may diminish the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

CycloSPORINE: May decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). Nicardipine may likewise inhibit the metabolism of cyclosporine. Cyclosporine dosage adjustments might be needed. *Risk C: Monitor therapy*

CYP1A2 Substrates: CYP1A2 Inhibitors (Moderate) may decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Angiotensin II Receptor Blockers may increase the serum concentration of Lithium. Management: Lithium dosage reductions will likely be needed following the addition of an angiotensin II receptor antagonist. *Risk D: Consider therapy modification*

Macrolide Antibiotics: May decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Magnesium Salts: Calcium Channel Blockers may enhance the adverse/toxic effect of Magnesium Salts. Magnesium Salts may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nafcillin: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents (Nondepolarizing): Calcium Channel Blockers may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Nitroprusside: Calcium Channel Blockers may enhance the hypotensive effect of Nitroprusside. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Phenytoin: Calcium Channel Blockers may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Potassium Salts: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: Angiotensin II Receptor Blockers may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk D: Consider therapy modification*

QuiNIDine: Calcium Channel Blockers (Dihydropyridine) may decrease the serum concentration of QuiNIDine. *Risk C: Monitor therapy*

Quinupristin: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Calcium Channel Blockers. This primarily affects oral forms of calcium channel blockers. *Risk D: Consider therapy modification*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Tacrolimus: Calcium Channel Blockers (Dihydropyridine) may increase the serum concentration of Tacrolimus. *Risk C: Monitor therapy*

Trimethoprim: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid bayberry, blue cohosh, cayenne, ephedra, ginger, ginseng (American), kola, licorice (may worsen hypertension). Avoid black cohosh, California poppy, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine, shepherd's purse (may enhance antihypertensive effects).

Monitoring ParametersBaseline and periodic electrolyte panels, renal and liver function, urinalysis; BP, heart rate, peripheral edema; in CHF, serum potassium during dose escalation and periodically thereafter

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsBaseline and periodic electrolyte panels, renal and liver function, urinalysis

Patient EducationSee individual agents.

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(am LOE di peen & val SAR tan)

U.S. Brand NamesExforge®

Pharmacologic CategoryAngiotensin II Receptor Blocker; Calcium Channel Blocker

Use: Labeled IndicationsTreatment of hypertension

Dosing: Adults **Note:** Dose is individualized; combination product may be used as initial therapy or substituted for individual components in patients currently maintained on both agents separately or in patients not adequately controlled with monotherapy (using one of the agents or an agent within same antihypertensive class).

Hypertension: Oral:

Initial therapy: Amlodipine 5 mg and valsartan 160 mg once daily, dose may be titrated after 1-2 weeks of therapy. Maximum recommended doses: Amlodipine 10 mg/day; valsartan 320 mg/day

Add-on/replacement therapy: Amlodipine 5-10 mg and valsartan 160-320 mg once daily; dose may be titrated after 3-4 weeks of therapy. Maximum recommended doses: Amlodipine 10 mg/day; valsartan 320 mg/day

Dosing: ElderlyRefer to adult dosing. Initiate amlodipine at 2.5 mg/day; due to decreased clearance.

Dosing: Renal Impairment

Cl_{cr} >10 mL/minute: No dosage adjustment necessary.

Cl_{cr} ≤10 mL/minute: Use caution; titrate slowly.

Dosing: Hepatic ImpairmentMild-to-moderate hepatic impairment: No initial dosage adjustment required, titrate slowly. Amlodipine and valsartan exposure increased in presence of hepatic impairment.
Amlodipine: Use caution in severe hepatic impairment; lower initial doses may be required.

Valsartan: Mild-to-moderate hepatic impairment: No dosage adjustment required; however, patients with mild-to-moderate chronic disease have twice the exposure as healthy volunteers.

Administration: OralAdminister with or without food.

Dietary ConsiderationsAvoid salt substitutes which contain potassium. May be taken with or without food.

StorageStore at controlled room temperature of 25°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from moisture.

ContraindicationsThere are no contraindications listed within the FDA-approved labeling.

Warnings/Precautions

Boxed warnings:

- Pregnancy: See “Special populations” below.

Concerns related to adverse effects:

- Angina/MI: Increased angina and/or MI has occurred with initiation or dosage titration of calcium channel blockers.
- Hyperkalemia: May occur with valsartan use; risk factors include renal dysfunction, diabetes mellitus, concomitant use of potassium-sparing diuretics, potassium supplements, and/or potassium-containing salts. Use cautiously, if at all, with these agents and monitor potassium closely.
- Hypotension/syncope: Symptomatic hypotension with or without syncope can rarely occur; use caution during initiation of therapy, particularly in patients with heart failure, severe aortic stenosis, or in post-MI patients or those undergoing surgery or dialysis.
- Peripheral edema: The most common side effect of amlodipine is peripheral edema; occurs within 2-3 weeks of starting therapy.
- Reflex tachycardia: May occur with amlodipine use.
- Renal function deterioration: Valsartan may be associated with deterioration of renal function and/or increases in serum creatinine, particularly in patients with low renal blood flow (eg, renal artery stenosis, heart failure) whose glomerular filtration rate (GFR) is dependent on efferent arteriolar vasoconstriction by angiotensin II; deterioration may result in oliguria, acute renal failure, and progressive azotemia. Small increases in serum creatinine may occur following initiation; consider discontinuation only in patients with progressive and/or significant deterioration in renal function.

Disease-related concerns:

- Aortic/mitral stenosis: Use with caution in patients with significant aortic/mitral stenosis.
- Heart failure: Use caution when initiating in heart failure; may need to adjust dose, and/or concurrent diuretic therapy.

- Hepatic impairment: Use with caution in patients with hepatic impairment; amlodipine and valsartan exposure increased in hepatic dysfunction.

- Hypovolemia: Avoid use or use a smaller dose in patients who are volume depleted; correct depletion first.

- Renal artery stenosis: Use valsartan with caution in patients with unstented unilateral/bilateral renal artery stenosis. When unstented bilateral renal artery stenosis is present, use is generally avoided due to the elevated risk of deterioration in renal function unless possible benefits outweigh risks.

- Renal impairment: Use with caution with pre-existing renal insufficiency and severe renal impairment.

Special populations:

- Elderly: Initiate at a lower dose in the elderly.

- Pediatrics: Safety and efficacy have not been established in children.

- Pregnancy: **[U.S. Boxed Warning]: Based on human data, drugs that act on the angiotensin system can cause injury and death to the developing fetus when used in the second and third trimesters. Angiotensin receptor blockers should be discontinued as soon as possible once pregnancy is detected.**

Other warnings/precautions:

- Titration: Dosage titration should occur after 3-4 weeks if blood pressure control inadequate.

Miscellaneous: Influenza (2%)

<1%, postmarketing, and/or case reports: Exanthema, hypersensitivity, hypotension, orthostatic hypotension, postural dizziness, syncope, tinnitus, visual disturbance

Frequency not defined, but occurred at ≥0.2% incidence (limited to important or life-threatening): Abdominal discomfort/distension, abdominal pain, arthralgia, cardiac murmur, chest pain, colitis, constipation, cystitis, depression, diabetes, dyspepsia, edema (including pitting), erectile dysfunction, erythema, fever, flatulence, flushing, gastritis, hematuria, hypercholesterolemia, infection, LFTs increased, lymphadenopathy, myalgia, nephrolithiasis, palpitation, paresthesia, pharyngitis, pneumonia, pruritus, rash, tachycardia, vomiting, weakness

Metabolism/Transport Effects

Amlodipine: **Substrate** of CYP3A4 (major); **Inhibits** CYP1A2 (moderate), 2A6 (weak), 2B6 (weak), 2C8 (weak), 2C9 (weak), 2D6 (weak), 3A4 (weak)

Valsartan: **Inhibits** CYP2C9 (weak)

Drug Interactions

ACE Inhibitors: Angiotensin II Receptor Blockers may enhance the adverse/toxic effect of ACE Inhibitors. *Risk C: Monitor therapy*

Alpha1-Blockers: May enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Barbiturates: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): May enhance the hypotensive effect of Calcium Channel Blockers (Dihydropyridine). Calcium Channel Blockers (Nondihydropyridine) may decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk C: Monitor therapy*

Calcium Salts: May diminish the therapeutic effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk C: Monitor therapy*

Clopidogrel: Calcium Channel Blockers may diminish the therapeutic effect of Clopidogrel. *Risk C: Monitor therapy*

CycloSPORINE: May decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). Nicardipine may likewise inhibit the metabolism of cyclosporine. Cyclosporine dosage adjustments might be needed. *Risk C: Monitor therapy*

CYP1A2 Substrates: CYP1A2 Inhibitors (Moderate) may decrease the metabolism of CYP1A2 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Eplerenone: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Fluconazole: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Grapefruit Juice: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Lithium: Angiotensin II Receptor Blockers may increase the serum concentration of Lithium. Management: Lithium dosage reductions will likely be needed following the addition of an angiotensin II receptor antagonist. *Risk D: Consider therapy modification*

Macrolide Antibiotics: May decrease the metabolism of Calcium Channel Blockers. **Exceptions:** Azithromycin; Dirithromycin [Off Market]; Spiramycin. *Risk D: Consider therapy modification*

Magnesium Salts: Calcium Channel Blockers may enhance the adverse/toxic effect of Magnesium Salts. Magnesium Salts may enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Nafcillin: May increase the metabolism of Calcium Channel Blockers. *Risk D: Consider therapy modification*

Neuromuscular-Blocking Agents (Nondepolarizing): Calcium Channel Blockers may enhance the neuromuscular-blocking effect of Neuromuscular-Blocking Agents (Nondepolarizing). *Risk C: Monitor therapy*

Nitroprusside: Calcium Channel Blockers may enhance the hypotensive effect of Nitroprusside. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May diminish the therapeutic effect of Angiotensin II Receptor Blockers. The combination of these two agents may also significantly decrease glomerular filtration and renal function. *Risk C: Monitor therapy*

Phenytoin: Calcium Channel Blockers may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Potassium Salts: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: Angiotensin II Receptor Blockers may enhance the hyperkalemic effect of Potassium-Sparing Diuretics. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk D: Consider therapy modification*

QuiNIDine: Calcium Channel Blockers (Dihydropyridine) may decrease the serum concentration of QuiNIDine. *Risk C: Monitor therapy*

Quinupristin: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Calcium Channel Blockers. This primarily affects oral forms of calcium channel blockers. *Risk D: Consider therapy modification*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Tacrolimus: Calcium Channel Blockers (Dihydropyridine) may increase the serum concentration of Tacrolimus. *Risk C: Monitor therapy*

Trimethoprim: May enhance the hyperkalemic effect of Angiotensin II Receptor Blockers. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Decreases rate and extent of valsartan absorption by 50% and 40%, respectively.

Herb/Nutraceutical: Avoid dong quai if using for hypertension (has estrogenic activity). Avoid ephedra, yohimbe, ginseng (may worsen hypertension). Avoid garlic (may have increased antihypertensive effects).

Monitoring ParametersBaseline and periodic electrolyte panels, renal and liver function, urinalysis; BP, heart rate, peripheral edema; in CHF, serum potassium during dose escalation and periodically thereafter

Nursing: Physical Assessment/MonitoringSee individual agents.

Monitoring: Lab TestsBaseline and periodic electrolyte panels, renal and liver function, urinalysis; in CHF, serum potassium during dose escalation and periodically thereafter

Patient EducationSee individual agents.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Exforge®:

5/160: Amlodipine 5 mg and valsartan 160 mg

5/320 mg: Amlodipine 5 mg and valsartan 320 mg

10/160: Amlodipine 10 mg and valsartan 160 mg

10/320: Amlodipine 10 mg and valsartan 320 mg

Generic AvailableNo

ManufacturerNovartis Pharmaceuticals Corp

Pricing: U.S. (www.drugstore.com)

Tablets (Exforge)

5-160 mg (30): $81.59

5-320 mg (30): $103.78

10-160 mg (30): $92.97

10-320 mg (30): $111.17

Mechanism of Action

Amlodipine inhibits calcium ion from entering the “slow channels” or select voltage-sensitive areas of vascular smooth muscle and myocardium during depolarization, producing a relaxation of coronary vascular smooth muscle and coronary vasodilation; increases myocardial oxygen delivery in patients with vasospastic angina.

Valsartan produces direct antagonism of the angiotensin II (AT2) receptors, unlike the ACE inhibitors. It displaces angiotensin II from the AT1 receptor and produces its blood pressure-lowering effects by antagonizing AT1-induced vasoconstriction, aldosterone release, catecholamine release, arginine vasopressin release, water intake, and hypertrophic responses. This action results in more efficient blockade of the cardiovascular effects of angiotensin II and fewer side effects than the ACE inhibitors.

Pharmacodynamics/KineticsSee individual agents.

Related Information

- AmLODIPine
- Valsartan

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Fewer reports of gingival hyperplasia with amlodipine than with other calcium channel blockers (usually resolves upon discontinuation); consultation with physician is suggested.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusHeadache is common; may cause anxiety, dizziness, or somnolence; may rarely cause insomnia and nervousness

Mental Health: Effects on Psychiatric TreatmentMay cause symptomatic hypotension; concomitant use with psychotropic agents may produce additive effects; monitor. Conversely, amphetamines may decrease the antihypertensive effects of valsartan. May increase the risk of lithium toxicity; monitor lithium levels.

Index TermsAmlodipine Besylate and Valsartan; Valsartan and Amlodipine

Medication Safety Issues

Sound-alike/look-alike issues:

AmLODIPine may be confused with aMILoride

Norvasc® may be confused with Navane®, Norvir®, Vascor®

Pronunciation(am LOE di peen)

U.S. Brand NamesNorvasc®

Canadian Brand NamesNorvasc®

Pharmacologic CategoryCalcium Channel Blocker

Use: Labeled IndicationsTreatment of hypertension; treatment of symptomatic chronic stable angina, vasospastic (Prinzmetal's) angina (confirmed or suspected); prevention of hospitalization due to angina with documented CAD (limited to patients without heart failure or ejection fraction <40%)

Dosing: Adults

Hypertension: Oral: Initial dose: 5 mg once daily; maximum dose: 10 mg once daily. In general, titrate in 2.5 mg increments over 7-14 days. Usual dosage range (JNC 7): 2.5-10 mg once daily.

Angina: Oral: Usual dose: 5-10 mg; lower dose suggested in elderly or hepatic impairment; most patients require 10 mg for adequate effect.

Dosing: ElderlyDosing should start at the lower end of dosing range due to possible increased incidence of hepatic, renal, or cardiac impairment. Elderly patients also show decreased clearance of amlodipine.
Hypertension: Oral: 2.5 mg once daily

Angina: Oral: 5 mg once daily

Dosing: Pediatric**Hypertension:** Oral: Children 6-17 years: 2.5-5 mg once daily

Dosing: Hepatic Impairment

Hypertension: Administer 2.5 mg once daily

Angina: Administer 5 mg once daily

Administration: OralMay be administered without regard to meals.

Dietary ConsiderationsMay be taken without regard to meals.

StorageStore at room temperature of 15°C to 30°C (59°F to 86°F).

Extemporaneously PreparedA 1 mg/mL suspension was stable for 91 days when refrigerated or 56 days when kept at room temperature when compounded as follows: Triturate fifty 5 mg tablets in a mortar, reduce to a fine powder. In a graduate, mix Ora-Sweet® 125 mL and Ora-Plus® 125 mL together. Add small amount of this mixture to the powder to make a paste. Add the remainder in small quantities while mixing. Shake well before using.

Nahata MC, Morosco RS, and Hipple TF, 4th ed, *Pediatric Drug Formulations*, Cincinnati, OH: Harvey Whitney Books Co, 2000.

ContraindicationsHypersensitivity to amlodipine or any component of the formulation

Allergy Considerations

- Calcium Channel Blocker, Dihydropyridine Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Angina/MI: Increased angina and/or MI has occurred with initiation or dosage titration of calcium channel blockers.
- Hypotension/syncope: Symptomatic hypotension with or without syncope can rarely occur; blood pressure must be lowered at a rate appropriate for the patient's clinical condition.
- Peripheral edema: The most common side effect is peripheral edema; occurs within 2-3 weeks of starting therapy.
- Reflex tachycardia: May occur with use.

Disease-related concerns:

- Aortic stenosis: Use with caution in patients with severe aortic stenosis.
- Hepatic impairment: Use with caution in patients with hepatic impairment; may require lower starting dose.

- Idiopathic hypertrophic subaortic stenosis (IHSS): Use with caution in patients with IHSS.

Special populations:

- Elderly: Initiate at a lower dose in the elderly.
- Pediatrics: Safety and efficacy have not been established in children <6 years of age.

Other warnings/precautions:

- Titration: Dosage titration should occur after 7-14 days on a given dose.

Geriatric ConsiderationsElderly may experience a greater hypotensive response. Constipation may be more of a problem in elderly. Calcium channel blockers are no more effective in elderly than other therapies, however, they do not cause significant CNS effects which is an advantage over some antihypertensive agents.

Pregnancy Risk FactorC

Pregnancy ConsiderationsEmbryotoxic effects have been demonstrated in small animals. No well-controlled studies have been conducted in pregnant women. Use in pregnancy only when clearly needed and when the benefits outweigh the potential hazard to the fetus.

LactationExcretion in breast milk unknown/not recommended

Adverse Reactions

>10%: Cardiovascular: Peripheral edema (2% to 15% dose related)

1% to 10%:

Cardiovascular: Flushing (1% to 3%), palpitation (1% to 4%)

Central nervous system: Headache (7%; similar to placebo 8%), dizziness (1% to 3%), fatigue (4%), somnolence (1% to 2%)

Dermatologic: Rash (1% to 2%), pruritus (1% to 2%)

Endocrine & metabolic: Male sexual dysfunction (1% to 2%)

Gastrointestinal: Nausea (3%), abdominal pain (1% to 2%), dyspepsia (1% to 2%), gingival hyperplasia

Neuromuscular & skeletal: Muscle cramps (1% to 2%), weakness (1% to 2%)

Respiratory: Dyspnea (1% to 2%), pulmonary edema (15% from PRAISE trial, CHF population)

<1%: Abnormal dreams, abnormal vision, allergic reactions, angioedema, anorexia, anxiety, arrhythmia, arthrosis, back pain, bradycardia, chest pain, conjunctivitis, constipation, depersonalization, depression, diaphoresis increased, diarrhea, diplopia, dysphagia, epistaxis, erythema multiforme, eye pain, female sexual dysfunction, flatulence, hot flushes, hyperglycemia, hypoesthesia, hypotension, insomnia, joint stiffness, leukopenia, malaise, micturition disorder, micturition frequency, myalgia, nervousness, nocturia, pain, pancreatitis, paresthesia, peripheral ischemia, peripheral neuropathy, postural dizziness, postural hypotension, purpura, rash erythematous, rash maculopapular, rigors, syncope, tachycardia, thirst, thrombocytopenia, tinnitus, tremor, vasculitis, vertigo, vomiting, weight gain/loss, xerostomia

<0.1%: Abnormal visual accommodation, agitation, alopecia, amnesia, apathy, appetite increased, ataxia, cardiac failure, cold and clammy skin, cough, dermatitis, dysuria, extrasystoles, gastritis, hypertonia, loose stools, migraine, muscle weakness, parosmia, polyuria, pulse irregularity, rhinitis, skin discoloration, skin dryness, taste perversion, twitching, urticaria, xerophthalmia

Postmarketing and/or case reports: Cholestasis, dysosmia, EPS, erythema multiforme, exfoliative dermatitis, gynecomastia, hepatitis, jaundice, leukocytoclastic vasculitis, nonthrombocytopenic purpura, phototoxicity, Stevens-Johnson syndrome, transaminases increased

Metabolism/Transport Effects**Substrate** of CYP3A4 (major); **Inhibits** CYP1A2 (moderate), 2A6 (weak), 2B6 (weak), 2C8 (weak), 2C9 (weak), 2D6 (weak), 3A4 (weak)

Drug Interactions

Alpha1-Blockers: May enhance the hypotensive effect of Calcium Channel Blockers. *Risk C: Monitor therapy*

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Phenytoin: Calcium Channel Blockers may decrease the metabolism of Phenytoin. *Risk D: Consider therapy modification*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Protease Inhibitors: May decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). *Risk D: Consider therapy modification*

QuiNIDine: Calcium Channel Blockers (Dihydropyridine) may decrease the serum concentration of QuiNIDine. *Risk C: Monitor therapy*

Quinupristin: May decrease the metabolism of Calcium Channel Blockers. *Risk C: Monitor therapy*

Rifamycin Derivatives: May increase the metabolism of Calcium Channel Blockers. This primarily affects oral forms of calcium channel blockers. *Risk D: Consider therapy modification*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Tacrolimus: Calcium Channel Blockers (Dihydropyridine) may increase the serum concentration of Tacrolimus. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Grapefruit juice may modestly increase amlodipine levels.

Herb/Nutraceutical: St John's wort may decrease amlodipine levels. Avoid dong quai if using for hypertension (has estrogenic activity). Avoid ephedra, yohimbe, ginseng (may worsen hypertension). Avoid garlic (may have increased antihypertensive effects).

Monitoring ParametersHeart rate, blood pressure, peripheral edema

Nursing: Physical Assessment/MonitoringAssess potential for interactions with prescription, OTC medications, or herbal products patient may be taking (eg, nitrates or other drugs that effect blood pressure). Assess therapeutic effectiveness (blood pressure; cardiac rhythm; frequency and intensity of angina; I & O ratio; weight; edema, according to purpose for use) and signs of adverse reactions at beginning of therapy, when changing dose, and periodically during long-term therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed; do not alter dose or discontinue medication without consulting prescriber. May cause headache (if unrelieved, consult prescriber); nausea or vomiting (small, frequent meals, frequent mouth care, chewing gum or sucking lozenges may help); constipation (increased dietary bulk and fluids may help); or drowsiness (use caution when driving or engaging in tasks that require alertness until response to drug is known). Report unrelieved headache; vomiting, constipation; palpitations; peripheral or facial swelling; weight gain >5 lb/week; or respiratory changes. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 2.5 mg, 5 mg, 10 mg

Norvasc®: 2.5 mg, 5 mg, 10 mg

Generic AvailableYes

ManufacturerPfizer U.S. Pharmaceuticals Group

Pricing: U.S. (www.drugstore.com)

Tablets (Amlodipine Besylate)

2.5 mg (90): $15.99

10 mg (90): $18.00

Tablets (Norvasc)

2.5 mg (30): $61.99

5 mg (30): $64.99

10 mg (30): $81.99

Mechanism of ActionInhibits calcium ion from entering the “slow channels” or select voltage-sensitive areas of vascular smooth muscle and myocardium during depolarization, producing a relaxation of coronary vascular smooth muscle and coronary vasodilation; increases myocardial oxygen delivery in patients with vasospastic angina

Pharmacodynamics/Kinetics

Onset of action: Antihypertensive: 30-50 minutes

Duration of antihypertensive effect: 24 hours

Absorption: Oral: Well absorbed

Distribution: V_d: 21 L/kg

Protein binding: 93% to 98%

Metabolism: Hepatic (>90%) to inactive metabolite

Bioavailability: 64% to 90%

Half-life elimination: 30-50 hours; increased with hepatic dysfunction

Time to peak, plasma: 6-12 hours

Excretion: Urine (10% as parent, 60% as metabolite)

Related Information

- Calcium Channel Blockers

Dental Health: Effects on Dental TreatmentFewer reports of gingival hyperplasia with amlodipine than with other CCBs (usually resolves upon discontinuation); consultation with physician is suggested.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness; rarely may produce insomnia and nervousness

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular Considerations

Hypertension: Amlodipine therapy should be continued for 4-6 weeks before the dose is increased. Daily doses >10 mg are associated with an increase in side effects (eg, edema) without further reductions in blood pressure. The ALLHAT study (ALLHAT Collaborative Group, 2002) compared CV outcomes of lisinopril, amlodipine, or chlorthalidone in hypertensive patients having at least one other risk factor for coronary heart disease. Investigators found no difference between the groups on the primary outcome of fatal coronary disease or nonfatal MI. The ASCOT-BPLA trial evaluated two regimens (calcium channel blocker/ACE inhibitor vs beta-blocker/thiazide diuretic) to test their efficacy in the primary prevention of coronary disease (nonfatal MI and fatal coronary artery disease). Patients 40-79 years of age were recruited; their blood pressures were either >160 systolic or >100 diastolic (untreated) or >140 systolic or >90 diastolic (treated). Treatment with a calcium channel blocker/ACE inhibitor was more effective at reducing cardiovascular outcomes than the beta-blocker/diuretic regimen.

Coronary Artery Disease: The Comparison of Amlodipine versus Enalapril to Limit Occurrences of Thrombosis (CAMELOT) trial compared a calcium channel blocker and ACE inhibitor in normotensive patients with coronary artery disease (Nissen, 2004). The primary outcome of CV events occurred in 151 (23.1%: placebo), 110 (16.6%: amlodipine), and 136 (20.2%: enalapril) of the patients. The only significant difference being a reduction in CV events with amlodipine compared with placebo, mainly representing a reduction in coronary revascularization and hospitalizations for angina with amlodipine. In the treatment of unstable angina/non-ST-segment elevation MI, oral long-acting calcium antagonists may also be considered in addition to beta-blockers and nitrates.

Heart Failure: The ACC/AHA 2005 guidelines for management of heart failure state that calcium channel blockers are not indicated for the routine treatment of heart failure patients with current/prior symptoms of heart failure and reduced LVEF. Only amlodipine has been shown not to adversely affect survival but most experience is not in patients on concurrent beta-blockers.

Anesthesia and Critical Care Concerns/Other ConsiderationsAmlodipine may be used safely to treat hypertension and/or angina in patients with heart failure.

Index TermsAmlodipine Besylate

Ammonia Spirit (Aromatic)

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(a MOE nee ah SPEAR it, air oh MAT ik)
Pharmacologic CategoryRespiratory Stimulant
Use: Labeled IndicationsRespiratory and circulatory stimulant; treatment of fainting
Use: DentalEmergency use in syncope
Dosing: AdultsFainting: Inhalation: Used as “smelling salts” to treat or prevent fainting
Dosing: ElderlyRefer to adult dosing.
StorageAromatic ammonia spirit should be protected from sunlight and stored at a temperature not exceeding 30°C.
ContraindicationsHypersensitivity to ammonia or any component of the formulation
Pregnancy Risk FactorC
Adverse Reactions1% to 10%:

Gastrointestinal: Nausea, vomiting

Respiratory: Irritation to nasal mucosa, cough

Drug InteractionsThere are no known significant interactions.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, for inhalation: 1.7% to 2.1% (0.33 mL, 60 mL)

Generic AvailableYes
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Index TermsSmelling Salts

Ammonium Chloride

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(a MOE nee um KLOR ide)

Pharmacologic CategoryElectrolyte Supplement, Parenteral

Use: Labeled IndicationsTreatment of hypochloremic states or metabolic alkalosis

Dosing: AdultsMetabolic alkalosis: The following equations represent different methods of correction utilizing either the serum HCO_3^-, the serum chloride, or the base excess

Dosing of mEq NH_4Cl via the chloride-deficit method (hypochloremia):

> Dose of mEq NH_4Cl = [0.2 L/kg x body weight (kg)] x [103 - observed serum chloride]; administer 50% of dose over 12 hours, then re-evaluate
>
> **Note:** 0.2 L/kg is the estimated chloride volume of distribution and 103 is the average normal serum chloride concentration (mEq/L)

Dosing of mEq NH_4Cl via the bicarbonate-excess method (refractory hypochloremic metabolic alkalosis):

> Dose of NH_4Cl = [0.5 L/kg x body weight (kg)] x (observed serum HCO_3^- - 24); administer 50% of dose over 12 hours, then re-evaluate
>
> **Note:** 0.5 L/kg is the estimated bicarbonate volume of distribution and 24 is the average normal serum bicarbonate concentration (mEq/L)

These equations will yield different requirements of ammonium chloride

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricMetabolic alkalosis: Refer to adult dosing for weight-based equations.

Administration: I.V.Administer by slow intravenous infusion to avoid local irritation and adverse effects. Rate of infusion should not exceed 5 mL/minute in an adult.

StoragePrior to use, vials should be stored at controlled room temperature of 15°C to 30°C (59°F to 86°F). Solution may crystallize if exposed to low temperatures. If crystals are observed, warm vial to room temperature in a water bath prior to use.

ReconstitutionDilute prior to use; final concentration should not exceed 1% to 2% ammonium chloride. Suggested dilution: Mix contents of 1-2 vials (100-200 mEq) in 500-1000 mL NS.

CompatibilityStable in dextran 6% in D_5W, dextran 6% in NS, D_5LR, D_5NS, $D_5{}^1/_2NS$, $D_5{}^1/_4NS$, D_5W, $D_{10}W$, LR, $^1/_2NS$, NS.

Y-site administration: Variable (consult detailed reference): Warfarin.

Compatibility when admixed: Incompatible: Levorphanol. **Variable (consult detailed reference):** Dimenhydrinate, potassium chloride.

ContraindicationsSevere hepatic or renal dysfunction

Warnings/Precautions

Concerns related to adverse effects:

- Ammonia toxicity: Monitor closely for signs and symptoms of ammonia toxicity, including diaphoresis, altered breathing, bradycardia, arrhythmias, retching, twitching, and coma.

Disease-related concerns:

- Respiratory disease: Use with caution in patients with primary respiratory acidosis or pulmonary insufficiency.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Geriatric ConsiderationsNo specific data available for elderly; monitor closely with hepatic disease for signs of toxicity.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted.

Adverse ReactionsFrequency not defined.

Central nervous system: Coma, drowsiness, EEG abnormalities, headache, mental confusion, seizure

Dermatologic: Rash

Endocrine & metabolic: Calcium-deficient tetany, hyperchloremia, hypokalemia, metabolic acidosis, potassium may be decreased, sodium may be decreased

Gastrointestinal: Abdominal pain, gastric irritation, nausea, vomiting

Hepatic: Ammonia may be increased

Local: Pain at site of injection

Neuromuscular & skeletal: Twitching

Respiratory: Hyperventilation

Drug Interactions

Amphetamines: Ammonium Chloride may decrease the serum concentration of Amphetamines. This effect is likely due to an enhanced excretion of amphetamines in the urine. *Risk C: Monitor therapy*

Analgesics (Opioid): Ammonium Chloride may increase the excretion of Analgesics (Opioid). *Risk C: Monitor therapy*

Potassium-Sparing Diuretics: May enhance the adverse/toxic effect of Ammonium Chloride. Specifically the risk of systemic acidosis. *Risk D: Consider therapy modification*

Monitoring ParametersSerum bicarbonate; signs and symptoms of ammonia toxicity

Monitoring: Lab TestsSerum bicarbonate

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution: Ammonium 5 mEq/mL and chloride 5 mEq/mL (20 mL) [equivalent to ammonium chloride 267.5 mg/mL]

Generic AvailableYes

Mechanism of ActionIncreases acidity by increasing free hydrogen ion concentration

Pharmacodynamics/Kinetics

Metabolism: Hepatic; forms urea and hydrochloric acid

Excretion: Urine

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause sedation and confusion

Mental Health: Effects on Psychiatric TreatmentNone reported

Amobarbital

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(am oh BAR bi tal)

U.S. Brand NamesAmytal®

Canadian Brand NamesAmytal®

Pharmacologic CategoryBarbiturate

Use: Labeled IndicationsHypnotic in short-term treatment of insomnia; reduce anxiety and provide sedation preoperatively

Use: Unlabeled/InvestigationalTherapeutic or diagnostic “Amytal® Interviewing”; Wada test

Dosing: Adults

Hypnotic: I.M., I.V.: 65-200 mg at bedtime (maximum single dose: 1000 mg)

Sedative: I.M., I.V.: 30-50 mg 2-3 times/day (maximum single dose: 1000 mg)

“Amytal® interview” (unlabeled use): I.V.: 50-100 mg/minute for total dose of 200-1000 mg or until patient experiences drowsiness, impaired attention, slurred speech, or nystagmus

Wada test (unlabeled use): Intra-arterial: 100 mg over 4-5 seconds via percutaneous transfemoral catheter

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Sedative: I.M., I.V.: 6-12 years: Manufacturer's dosing range: 65-500 mg

Hypnotic (unlabeled use): I.M.: 2-3 mg/kg (maximum: 500 mg)

Dosing: Renal ImpairmentDosing should be reduced; specific recommendations not available.

Dosing: Hepatic ImpairmentDosing should be reduced; specific recommendations not available.

Administration: I.M.Administer deeply into a large muscle. Do not use more than 5 mL at any single site (may cause tissue damage). I.M. dosages should not exceed 500 mg. Use 20% solution to facilitate larger doses.

Administration: I.V.Use only when I.M. administration is not feasible; administer by slow I.V. injection (maximum: 50 mg/minute in adults).

StoragePowder should be stored at 15°C to 30°C (59°F to 86°F). Following reconstitution, solution should be used within 30 minutes.

ReconstitutionReconstitute with SWFI to make a 10% I.V. solution; a 20% solution may be made for I.M. use. Rotate vial to dissolve, do not shake. Do not use unless a clear solution forms within 5 minutes.

CompatibilityStable in D_5LR, D_5NS, D_5W, $D_{10}W$, $D_{20}W$, LR, NS.

Compatibility when admixed: Compatible: Amikacin, aminophylline, sodium bicarbonate. **Incompatible:** Cefazolin, cimetidine, clindamycin, diphenhydramine, droperidol, hydroxyzine, insulin (regular), levorphanol, meperidine, morphine, norepinephrine, pancuronium, pentazocine, penicillin G potassium, procaine, streptomycin, vancomycin. **Variable (consult detailed reference):** Atracurium, dimenhydrinate, hydrocortisone sodium succinate, isoproterenol, metaraminol, methyldopate, norepinephrine, succinylcholine.

RestrictionsC-II

ContraindicationsHypersensitivity to barbiturates or any component of the formulation; marked hepatic impairment; dyspnea or airway obstruction; porphyria

Allergy Considerations

- Aromatic Anticonvulsant Allergy/Hypersensitivity

Warnings/Precautions

Concerns related to adverse effects:

- CNS depression: May cause CNS depression, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving).
- Hypersensitivity reactions: Postmarketing studies have indicated that the use of hypnotic/sedative agents for sleep has been associated with hypersensitivity reactions including anaphylaxis as well as angioedema.
- Paradoxical responses: May cause paradoxical responses, including agitation and hyperactivity, particularly in acute pain, chronic pain and pediatric patients.
- Sleep-related activities: An increased risk for hazardous sleep-related activities such as sleep-driving; cooking and eating food, and making phone calls while asleep has been noted with sedative-hypnotic medications. Discontinue treatment in patients who report a sleep-driving episode.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease; may cause hypotension.

- Depression: Use with caution in patients with depression or suicidal tendencies.

- Drug abuse: Use with caution in patients with a history of drug abuse or acute alcoholism; potential for drug dependency exists. Tolerance, psychological and physical dependence may occur with prolonged use.

- Hepatic impairment: Use with caution in patients with hepatic impairment, decreased dosage may be needed; contraindicated in severe impairment.

- Insomnia: Appropriate use: When used as a hypnotic for the treatment of insomnia, effectiveness is limited to ≤2 weeks.

- Renal impairment: Use with caution in patients with renal impairment; decreased dosage may be needed.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly; not recommended for use. Closely monitor elderly or debilitated patients for impaired cognitive or motor performance.

- Pediatrics: Safety and efficacy have not been established in children <6 years of age; use with caution in children ≥6 years of age.

Dosage form specific issues:

- Alkaline solution: Solution for injection is highly alkaline and extravasation may cause local tissue damage.

Other warnings/precautions:

- Rapid administration: Rapid I.V. administration may cause respiratory depression, apnea, and hypotension.

- Withdrawal: Gradual withdrawal is recommended if used over extended periods of time.

Pregnancy Risk FactorD

Pregnancy ConsiderationsBarbiturates cross the placenta and distribute in fetal tissue. Teratogenic effects have been reported with 1st trimester exposure. Exposure during the 3rd trimester may lead to symptoms of acute withdrawal following delivery; symptoms may be delayed up to 14 days.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsSmall amounts of barbiturates are excreted in breast milk; information specific for amobarbital is not available.

Adverse ReactionsFrequency not defined and is reported as barbiturate use (not specifically amobarbital).

Cardiovascular: Bradycardia, hypotension, syncope

Central nervous system: Agitation, anxiety, ataxia, confusion, CNS depression, dizziness, fever, hallucinations, headache, insomnia, nightmares, nervousness, psychiatric disturbances, somnolence, thinking abnormal

Gastrointestinal: Constipation, nausea, vomiting

Hematologic: Megaloblastic anemia (following chronic phenobarbital use)

Hepatic: Liver damage

Local: Injection site reaction

Neuromuscular & skeletal: Hyperkinesia

Respiratory: Apnea, atelectasis (postoperative), hypoventilation

Miscellaneous: Hypersensitivity reaction (including angioedema, rash, and exfoliative dermatitis)

Metabolism/Transport Effects**Induces** CYP2A6 (strong)

Drug Interactions

Acetaminophen: Barbiturates may increase the metabolism of Acetaminophen. This may 1) diminish the effect of acetaminophen; and 2) increase the risk of liver damage. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Beta-Blockers: Barbiturates may decrease the serum concentration of Beta-Blockers. **Exceptions:** Atenolol; Levobunolol; Metipranolol; Nadolol. *Risk C: Monitor therapy*

Calcium Channel Blockers: Barbiturates may increase the metabolism of Calcium Channel Blockers. **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Chloramphenicol: May decrease the metabolism of Barbiturates. Barbiturates may increase the metabolism of Chloramphenicol. *Risk D: Consider therapy modification*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

Contraceptive (Progestins): Barbiturates may diminish the therapeutic effect of Contraceptive (Progestins). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Barbiturates may increase the metabolism of Corticosteroids (Systemic). *Risk C: Monitor therapy*

CycloSPORINE: Barbiturates may increase the metabolism of CycloSPORINE. *Risk D: Consider therapy modification*

CYP2A6 Substrates: CYP2A6 Inducers (Strong) may increase the metabolism of CYP2A6 Substrates. *Risk C: Monitor therapy*

Disopyramide: Barbiturates may increase the metabolism of Disopyramide. *Risk D: Consider therapy modification*

Doxycycline: Barbiturates may decrease the serum concentration of Doxycycline. *Risk D: Consider therapy modification*

Etoposide: Barbiturates may increase the metabolism of Etoposide. *Risk C: Monitor therapy*

Etoposide Phosphate: Barbiturates may decrease the serum concentration of Etoposide Phosphate. Barbiturates may increase the metabolism, via CYP isoenzymes, of etoposide phosphate. *Risk C: Monitor therapy*

Felbamate: May increase the serum concentration of Barbiturates. *Risk C: Monitor therapy*

Griseofulvin: Barbiturates may decrease the absorption of Griseofulvin. *Risk D: Consider therapy modification*

LamoTRIgine: Barbiturates may increase the metabolism of LamoTRIgine. *Risk D: Consider therapy modification*

Meperidine: Barbiturates may enhance the CNS depressant effect of Meperidine. *Risk C: Monitor therapy*

Methadone: Barbiturates may increase the metabolism of Methadone. *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): Barbiturates may diminish the therapeutic effect of Oral Contraceptive (Estrogens). Contraceptive failure is possible. *Risk D: Consider therapy modification*

Primidone: May enhance the adverse/toxic effect of Barbiturates. Primidone is converted to phenobarbital, and thus becomes additive with existing barbiturate therapy. *Risk C: Monitor therapy*

Propafenone: Barbiturates may increase the metabolism of Propafenone. *Risk D: Consider therapy modification*

Pyridoxine: May increase the metabolism of Barbiturates. Apparent in high pyridoxine doses (eg, 200 mg/day) *Risk C: Monitor therapy*

QuiNIDine: Barbiturates may increase the metabolism of QuiNIDine. *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of Barbiturates. *Risk C: Monitor therapy*

Teniposide: Barbiturates may increase the metabolism of Teniposide. *Risk C: Monitor therapy*

Theophylline Derivatives: Barbiturates may increase the metabolism of Theophylline Derivatives. **Exceptions:** Dyphylline. *Risk C: Monitor therapy*

Tricyclic Antidepressants: Barbiturates may increase the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Valproic Acid: May decrease the metabolism of Barbiturates. Barbiturates may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Barbiturates may increase the metabolism of Vitamin K Antagonists. *Risk D: Consider therapy modification*

Voriconazole: Barbiturates may decrease the serum concentration of Voriconazole. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb InteractionsEthanol: Avoid ethanol (may increase CNS depression).
Monitoring ParametersVital signs should be monitored during injection and for several hours after administration.
Reference Range

Therapeutic: 1-5 mcg/mL (SI: 4-22 µmol/L)

Toxic: >10 mcg/mL (SI: >44 µmol/L)

Lethal: >50 mcg/mL

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, as sodium:

Amytal®: 500 mg

Generic AvailableNo
Mechanism of ActionInterferes with transmission of impulses from the thalamus to the cortex of the brain resulting in an imbalance in central inhibitory and facilitatory mechanisms
Pharmacodynamics/Kinetics

Onset of action: I.V.: Within 5 minutes

Distribution: Readily crosses placenta; small amounts enter breast milk

Metabolism: Primarily hepatic via microsomal enzymes

Half-life elimination: 15-40 hours (mean: 25 hours)

Excretion: Urine, feces

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Index Terms Amobarbital Sodium; Amylobarbitone

References

Kavirajan H, “The Amobarbital Interview Revisited: A Review of the Literature Since 1966,” *Harv Rev Psychiatry*, 1999, 7(3):153-65.[PubMed 10483934]

International Brand Names Amycal (NO); Amytal Sodium (AU); Barbamyl (IL); Dorlotin (HU); Dorlotyn (HU); Eunoctal (FR); Isoamitil Sedante (ES); Isomytal (JP); Neur-Amyl (AU); Placidel (ES); Sodium Amytal (GB); Transital (ES)

Amonafide

Lexi-Drugs Online

Jump To Field (Select Field Name)

Pronunciation(a MON a fide)
Pharmacologic CategoryAntineoplastic Agent, DNA Binding Agent; Enzyme Inhibitor, Topoisomerase II Inhibitor
Use: Unlabeled/InvestigationalInvestigational: Breast, prostate, renal cell, ovarian, pancreatic, and nonsmall cell lung cancers
Dosing: AdultsRefer to individual protocols.

Breast cancer: 800 mg/m^2 over 3 hours every 28 days

Renal cell, ovarian, pancreatic cancer: Up to 450 mg/m^2 over 1 hour on days 1-5 every 21 days

Nonsmall cell lung cancer: 1600 mg/m^2 by continuous infusion over 24 hours every 21 days

Dosing: ElderlyRefer to adult dosing.
Dosing: Hepatic ImpairmentDosage adjustment may be required, but specific guidelines have not been established.
Calculations

- Body Surface Area: Adults

Administration: I.V.May be administered by short (1-3 hours) infusion or continuous (24-hour) infusion.
StorageStore intact vials under refrigeration at 2°C to 8°C (36°F to 46°F). Reconstituted vials and solutions for infusion are stable for up to 14 days at room temperature or under refrigeration.
ReconstitutionVials may be reconstituted with SWFI or 0.9% sodium chloride.
Compatibility**Incompatible** with dextrose solutions.
ContraindicationsHypersensitivity to amonafide or any component of the formulation; pregnancy
Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Toxicity: Amonafide toxicity, particularly hematologic, correlates with the patient's acetylator status. If possible, determination of acetylator type (fast vs slow) should be considered prior to beginning therapy.

Disease-related concerns:

- Bone marrow suppression: Use with caution in patients with existing bone marrow suppression.

- Cardiovascular disease: Use with caution in patients with arrhythmias, conduction problems, and/or congestive heart failure.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Seizure disorder: Use with caution in patients with a history of seizure disorder or other neurological disorders.

Special populations:

- Bone marrow transplant recipients: Use with caution in bone marrow transplant patients.

Adverse Reactions

>10%:

Gastrointestinal: Nausea and vomiting (mild)

Hematologic: Granulocytopenia, possibly dose limiting; nadir occurs at days 12-15, recovery by day 21

1% to 10%:

Cardiovascular: Chest pain

Central nervous system: Dizziness, fatigue, headache

Dermatologic: Skin rash, exfoliative dermatitis, alopecia

Local: Inflammatory reactions

Otic: Tinnitus

Neuromuscular & skeletal: Myoclonic jerking, weakness

<1%: CHF, hypotension, taste alteration, thrombocytopenia

Oncology: VesicantNo
Oncology: Emetic PotentialModerate (30% to 60%)
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Powder for injection, lyophilized: 500 mg

Generic AvailableNo
Mechanism of ActionAmonafide acts as a DNA intercalator, stabilizing DNA to thermal denaturation and producing single-strand DNA breaks.
Pharmacodynamics/Kinetics

Distribution: V_d: 370-530 L/m^2

Protein binding: High

Half-life:

Elimination: 3.5-11 hours

Terminal: 3-6 hours

Metabolism: Hepatic, primarily by oxidation and N-acetylation. N-acetylamonafide (active) and amonafide-N′-oxide are the major metabolites. Clearance depends on whether the patient is a fast or slow acetylator. Fast acetylators may experience greater toxicity from the drug.

Excretion: Urine (3% to 22% as unchanged drug)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness and sedation
Mental Health: Effects on Psychiatric TreatmentGranulocytopenia is common; use caution with clozapine; monitor
Index TermsAmonafide Hydrochloride; Benzisoquinolinedione; BIDA; M-FA-142; Nafidimide; NSC-308847

Amoxapine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Medication Safety Issues

Sound-alike/look-alike issues:

Amoxapine may be confused with amoxicillin, Amoxil®

Asendin may be confused with aspirin

Pronunciation(a MOKS a peen)

Pharmacologic CategoryAntidepressant, Tricyclic (Secondary Amine)

Use: Labeled IndicationsTreatment of depression, psychotic depression, depression accompanied by anxiety or agitation

Dosing: AdultsOnce symptoms are controlled, decrease gradually to lowest effective dose. Maintenance dose is usually given at bedtime to reduce daytime sedation.

Depression: Oral: Initial: 25 mg 2-3 times/day. If tolerated, dosage may be increased to 100 mg 2-3 times/day. May be given in a single bedtime dose when dosage <300 mg/day.

Maximum daily dose: 600 mg (inpatients); 400 mg (outpatients)

Dosing: ElderlyOral: Initial: 25 mg at bedtime increased by 25 mg weekly for outpatients and every 3 days for inpatients if tolerated; usual dose: 50-150 mg/day, but doses up to 300 mg may be necessary. **Note:** Once symptoms are controlled, decrease gradually to lowest effective dose. See Geriatric Considerations.

Dosing: Pediatric

Depression: Oral:

Children: Not established in children <16 years of age.

Adolescents: Initial: 25-50 mg/day; increase gradually to 100 mg/day. May administer as divided doses or as a single dose at bedtime.

Note: Once symptoms are controlled, decrease gradually to lowest effective dose. Maintenance dose is usually given at bedtime to reduce daytime sedation.

Administration: OralMay be administered with food to decrease GI distress.

RestrictionsAn FDA-approved medication guide concerning the use of antidepressants in children, adolescents, and young adults must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm. Dispense to parents or guardians of children and adolescents receiving this medication.

ContraindicationsHypersensitivity to amoxapine or any component of the formulation; use of MAO inhibitors within past 14 days; acute recovery phase following myocardial infarction

Allergy Considerations

- Tricyclic Antidepressant and Related Compounds Allergy

Warnings/Precautions

Boxed warnings:

- Suicidal thinking/behavior: See “Major psychiatric warnings” below.

Major psychiatric warnings:

- **[U.S. Boxed Warning]: Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 years of age) with major depressive disorder (MDD) and other psychiatric disorders;** consider risk prior to prescribing. Short-term studies did not show an increased risk in patients >24 years of age and showed a decreased risk in patients ≥65 years. Closely monitor patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 months of therapy or during periods of dosage adjustments (increases or decreases); the patient’s family or caregiver should be instructed to closely observe the patient and communicate condition with healthcare provider. A medication guide concerning the use of antidepressants should be dispensed with each prescription. **Amoxapine is not FDA approved for use in patients <16 years of age.**

- The possibility of a suicide attempt is inherent in major depression and may persist until remission occurs. Patients treated with antidepressants should be observed for clinical worsening and suicidality, especially during the initial few months of a course of drug therapy, or at times of dose changes, either increases or decreases. Worsening depression and severe abrupt suicidality that are not part of the presenting symptoms may require discontinuation or modification of drug therapy. Use caution in high-risk patients during initiation of therapy.

- Prescriptions should be written for the smallest quantity consistent with good patient care. The patient's family or caregiver should be alerted to monitor patients for the emergence of suicidality and associated behaviors such as anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, and mania; patients should be instructed to notify their healthcare provider if any of these symptoms or worsening depression or psychosis occur.

- May worsen psychosis in some patients or precipitate a shift to mania or hypomania in patients with bipolar disorder. Monotherapy in patients with bipolar disorder should be avoided. Patients presenting with depressive symptoms should be screened for bipolar disorder. **Amoxapine is not FDA approved for the treatment of bipolar depression.**

Concerns related to adverse effects:

- Anticholinergic effects: May cause anticholinergic effects (constipation, xerostomia, blurred vision, urinary retention); use with caution in patients with decreased gastrointestinal motility, paralytic ileus, urinary retention, BPH, xerostomia, or visual problems. The degree of anticholinergic blockade produced by this agent is moderate relative to other antidepressants.

- Extrapyramidal symptoms: May cause extrapyramidal symptoms, including pseudoparkinsonism, acute dystonic reactions, akathisia, and tardive dyskinesia (risk of these reactions is low).

- Neuroleptic malignant syndrome (NMS): Use may be associated with NMS; monitor for mental status changes, fever, muscle rigidity, and/or autonomic instability (risk may be increased in patients with Parkinson's disease or Lewy body dementia).

- Orthostatic hypotension: May cause orthostatic hypotension (risk is moderate relative to other antidepressants); use with caution in patients at risk of this effect or in those who would not tolerate transient hypotensive episodes (cerebrovascular disease, cardiovascular disease, hypovolemia, or concurrent medication use which may predispose to hypotension/bradycardia).

- Sedation: May cause sedation, which may impair physical or mental abilities; patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving). The degree of sedation is moderate relative to other antidepressants.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with a history of cardiovascular disease (including previous MI, stroke, tachycardia, or conduction abnormalities); the risk conduction abnormalities with this agent is moderate relative to other antidepressants.

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Renal impairment: Use with caution in patients with renal impairment.

- Seizure disorder: Use with caution in patients at risk of seizures, including those with a history of seizures, head trauma, brain damage, alcoholism, or concurrent therapy with medications which may lower seizure threshold.

- Thyroid dysfunction: Use with caution in patients with hyperthyroidism or those receiving thyroid supplementation.

Concurrent drug therapy issues:

- Sedatives: Effects may be potentiated when used with other sedative drugs or ethanol.

Special populations:

- Elderly: Use with caution in the elderly.

Other warnings/precautions:

- Discontinuation of therapy: Therapy should not be abruptly discontinued in patients receiving high doses for prolonged periods.

- Electroconvulsive therapy: May increase the risks associated with electroconvulsive therapy; consider discontinuing, when possible, prior to ECT treatment.

⇧ Geriatric ConsiderationsAmoxapine is not the drug of choice in the elderly. Significant anticholinergic and orthostatic effects can occur and there is a risk for tardive dyskinesia and neuroleptic malignant syndrome.
⇧ Pregnancy Risk FactorC
⇧ LactationEnters breast milk/contraindicated (AAP rates “of concern”)
⇧ Adverse Reactions

>10%:

Central nervous system: Drowsiness

Gastrointestinal: Xerostomia, constipation

1% to 10%:

Central nervous system: Anxiety, ataxia, confusion, dizziness, excitement, headache, insomnia, nervousness, restlessness

Dermatologic: Edema, skin rash

Endocrine: Prolactin levels increased

Gastrointestinal: Nausea

Neuromuscular & skeletal: Tremor, weakness

Ocular: Blurred vision

Miscellaneous: Diaphoresis

<1%: Abdominal pain, abnormal taste, agranulocytosis, allergic reactions, breast enlargement, diarrhea, epigastric distress, extrapyramidal symptoms, flatulence, galactorrhea, hyper-/hypotension, impotence, incoordination, intraocular pressure increased, lacrimation, leukopenia, libido decreased, libido increased, liver enzymes increased, menstrual irregularity, micturition delayed, mydriasis, nasal stuffiness, neuroleptic malignant syndrome, numbness, painful ejaculation, paresthesia, photosensitivity, seizure, SIADH, syncope, tachycardia, tardive dyskinesia, testicular edema, tinnitus, urinary retention, vomiting

Metabolism/Transport Effects **Substrate** of CYP2D6 (major)

Drug Interactions

Acetylcholinesterase Inhibitors (Central): Anticholinergics may diminish the therapeutic effect of Acetylcholinesterase Inhibitors (Central). Acetylcholinesterase Inhibitors (Central) may diminish the therapeutic effect of Anticholinergics. If the anticholinergic action is a side effect of the agent, the result may be beneficial. *Risk C: Monitor therapy*

Alcohol (Ethyl): CNS Depressants may enhance the CNS depressant effect of Alcohol (Ethyl). *Risk C: Monitor therapy*

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Alpha-/Beta-Agonists (Direct-Acting): Tricyclic Antidepressants may enhance the vasopressor effect of Alpha-/Beta-Agonists (Direct-Acting). **Exceptions:** Dipivefrin. *Risk D: Consider therapy modification*

Alpha1-Agonists: Tricyclic Antidepressants may enhance the vasopressor effect of Alpha1-Agonists. *Risk D: Consider therapy modification*

Alpha2-Agonists: Tricyclic Antidepressants may diminish the antihypertensive effect of Alpha2-Agonists. **Exceptions:** Apraclonidine; Brimonidine. *Risk D: Consider therapy modification*

Altretamine: May enhance the orthostatic effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Amphetamines: Tricyclic Antidepressants may enhance the stimulatory effect of Amphetamines. Tricyclic Antidepressants may also potentiate the cardiovascular effects of Amphetamines. *Risk C: Monitor therapy*

Anticholinergics: May enhance the adverse/toxic effect of other Anticholinergics. **Exceptions:** Paliperidone. *Risk C: Monitor therapy*

Barbiturates: May increase the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Beta2-Agonists: Tricyclic Antidepressants may enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

CarBAMazepine: May increase the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Cimetidine: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Cinacalcet: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

CNS Depressants: May enhance the adverse/toxic effect of other CNS Depressants. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Moderate): May decrease the metabolism of CYP2D6 Substrates. *Risk C: Monitor therapy*

CYP2D6 Inhibitors (Strong): May decrease the metabolism of CYP2D6 Substrates. *Risk D: Consider therapy modification*

Darunavir: May increase the serum concentration of CYP2D6 Substrates. *Risk C: Monitor therapy*

Desmopressin: Tricyclic Antidepressants may enhance the adverse/toxic effect of Desmopressin. *Risk C: Monitor therapy*

Dexmethylphenidate: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

DULoxetine: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Iobenguane I 123: Tricyclic Antidepressants may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

Lithium: May enhance the neurotoxic effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the serotonergic effect of Tricyclic Antidepressants. This may cause serotonin syndrome. *Risk X: Avoid combination*

Methylphenidate: May decrease the metabolism of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

Pramlintide: May enhance the anticholinergic effect of Anticholinergics. These effects are specific to the GI tract. *Risk D: Consider therapy modification*

Propoxyphene: May enhance the CNS depressant effect of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Protease Inhibitors: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

QuiNIDine: Tricyclic Antidepressants may enhance the QTc-prolonging effect of QuiNIDine. QuiNIDine may decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Selective Serotonin Reuptake Inhibitors: May decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Serotonin Modulators: May enhance the adverse/toxic effect of other Serotonin Modulators. The development of serotonin syndrome may occur. *Risk D: Consider therapy modification*

Sibutramine: May enhance the serotonergic effect of Serotonin Modulators. This may cause serotonin syndrome. *Risk X: Avoid combination*

St Johns Wort: May increase the metabolism of Tricyclic Antidepressants. The risk of serotonin syndrome may theoretically be increased. *Risk D: Consider therapy modification*

Sulfonylureas: Cyclic Antidepressants may enhance the hypoglycemic effect of Sulfonylureas. *Risk C: Monitor therapy*

Terbinafine: May decrease the metabolism of Tricyclic Antidepressants. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Thioridazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Thioridazine. *Risk X: Avoid combination*

TraMADol: Tricyclic Antidepressants may enhance the neuroexcitatory and/or seizure-potentiating effect of TraMADol. *Risk C: Monitor therapy*

Valproic Acid: May increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Vitamin K Antagonists (eg, warfarin): Tricyclic Antidepressants may enhance the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Ziprasidone: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Ziprasidone. The risk of a severe arrhythmia may be increased. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol (may increase CNS depression).

Food: Grapefruit juice may inhibit the metabolism of some TCAs and clinical toxicity may result.

Herb/Nutraceutical: Avoid valerian, St John's wort, SAMe, kava kava.

Test InteractionsIncreased glucose, liver function tests; decreased WBC

Monitoring ParametersMonitor blood pressure and pulse rate prior to and during initial therapy evaluate mental status, suicidal ideation (especially at the beginning of therapy or when doses are increased or decreased); monitor weight; ECG in older adults

Reference RangeTherapeutic: Amoxapine: 20-100 ng/mL (SI: 64-319 nmol/L); 8-OH amoxapine: 150-400 ng/mL (SI: 478-1275 nmol/L); both: 200-500 ng/mL (SI: 637-1594 nmol/L)

Nursing: Physical Assessment/MonitoringAssess other medications patient may be taking for effectiveness and interactions (eg, concomitant use with MAO inhibitors can be fatal). Monitor for unusual changes in behavior, clinical worsening, and suicidal ideation especially at time of initiation of therapy and during dosage adjustments. Assess for history of addiction; long-term use can result in dependence, abuse, or tolerance; periodically evaluate need for continued use. Caution patients with diabetes; may increase serum glucose levels. Monitor therapeutic effectiveness and adverse reactions at beginning of therapy and periodically with long-term use. Taper dosage slowly when discontinuing. Teach patient appropriate use, interventions to reduce side effects, and adverse symptoms to report.

Patient EducationTake exactly as directed; do not increase dose or frequency. It may take several weeks to achieve desired results. Restrict use of alcohol and caffeine; avoid grapefruit juice. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. If you have diabetes, monitor glucose levels closely; this medication may alter glucose levels. May cause drowsiness, lightheadedness, impaired coordination, dizziness, or blurred vision (use caution when driving or engaging in tasks requiring alertness until response to drug is known); nausea, vomiting, increased appetite, or dry mouth (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); constipation (increased exercise, fluids, fruit, or fiber may help); or altered sexual drive or ability (reversible). Report persistent CNS effects (eg, confusion, restlessness, anxiety, insomnia, excitation, headache, dizziness, fatigue, impaired coordination); muscle cramping, weakness, tremors, rigidity or alterations in ambulation; visual disturbances; excessive GI symptoms (eg, cramping, constipation, vomiting); or worsening of condition; and suicide ideation. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet: 25 mg, 50 mg, 100 mg, 150 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Tablets (Amoxapine)

25 mg (60): $25.99

50 mg (60): $28.99

100 mg (30): $35.99

150 mg (30): $38.99

Mechanism of ActionReduces the reuptake of serotonin and norepinephrine. The metabolite, 7-OH-amoxapine has significant dopamine receptor blocking activity similar to haloperidol.

Pharmacodynamics/Kinetics

Onset of antidepressant effect: Usually occurs after 1-2 weeks, but may require 4-6 weeks

Absorption: Rapid and well absorbed

Distribution: V_d: 0.9-1.2 L/kg; enters breast milk

Protein binding: 80%

Metabolism: Primarily hepatic

Half-life elimination: Parent drug: 11-16 hours; Active metabolite (8-hydroxy): Adults: 30 hours

Time to peak, serum: 1-2 hours

Excretion: Urine (as unchanged drug and metabolites)

- Discontinuation of Psychotropic Drugs
- Teratogenic Risks of Psychotropic Medications

Pharmacotherapy PearlsExtrapyramidal reactions and tardive dyskinesia may occur.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia and changes in salivation (normal salivary flow resumes upon discontinuation). Long-term treatment with TCAs, such as amoxapine, increases the risk of caries by reducing salivation and salivary buffer capacity.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsUse with caution; epinephrine and levonordefrin have been shown to have an increased pressor response in combination with TCAs. Amoxapine is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Mental Health CommentAmoxapine's metabolite (7-OH-amoxapine) blocks dopamine receptors. Therefore, extrapyramidal side effects noted with antipsychotic agents may also be seen with this antidepressant. May be useful as a third-line agent to treat depression with psychotic features. Generally not recommended for elderly patients.

Medication Safety Issues

Sound-alike/look-alike issues:

Augmentin® may be confused with Azulfidine®

Pronunciation(a moks i SIL in & klav yoo LAN ate poe TASS ee um)

U.S. Brand NamesAmoclan; Augmentin ES-600®; Augmentin XR®; Augmentin®

Canadian Brand NamesAlti-Amoxi-Clav; Apo-Amoxi-Clav®; Augmentin®; Clavulin®; Novo-Clavamoxin; ratio-Aclavulanate

Pharmacologic CategoryAntibiotic, Penicillin

Use: Labeled IndicationsTreatment of otitis media, sinusitis, and infections caused by susceptible organisms involving the lower respiratory tract, skin and skin structure, and urinary tract; spectrum same as amoxicillin with additional coverage of beta-lactamase producing *B. catarrhalis*, *H. influenzae*, *N. gonorrhoeae*, and *S. aureus* (not MRSA). The expanded coverage of this combination makes it a useful alternative when amoxicillin resistance is present and patients cannot tolerate alternative treatments.

Use: DentalTreatment of orofacial infections when beta-lactamase-producing staphylococci and beta-lactamase-producing *Bacteroides* are present

Dosing: Adults**Note:** Dose is based on the amoxicillin component; see "Augmentin® Product-Specific Considerations" table.

Susceptible infections: Children >40 kg and Adults: Oral: 250-500 mg every 8 hours or 875 mg every 12 hours

Augmentin® Product-Specific Considerations

Strength	**Form**	**Consideration**
125 mg	CT, S	q8h dosing
	S	For adults having difficulty swallowing tablets, 125 mg/5 mL suspension may be substituted for 500 mg tablet.
200 mg	CT, S	q12h dosing
	CT	Contains phenylalanine
	S	For adults having difficulty swallowing tablets, 200 mg/5 mL suspension may be substituted for 875 mg tablet.
250 mg	CT, S, T	q8h dosing
	CT	Contains phenylalanine
	T	Not for use in patients <40 kg
	CT, T	Tablet and chewable tablet are not interchangeable due to differences in clavulanic acid.
	S	For adults having difficulty swallowing tablets, 250 mg/5 mL suspension may be substituted for 500 mg tablet.
400 mg	CT, S	q12h dosing
	CT	Contains phenylalanine
	S	For adults having difficulty swallowing tablets, 400 mg/5 mL suspension may be substituted for 875 mg tablet.

500 mg	T	q8h or q12h dosing
600 mg	S	q12h dosing
		Contains phenylalanine
		Not for use in adults or children ≥40 kg
		600 mg/5 mL suspension is not equivalent to or interchangeable with 200 mg/5 mL or 400 mg/5 mL due to differences in clavulanic acid.
875 mg	T	q12h dosing; not for use in Cl_{cr} <30 mL/minute
1000 mg	XR	q12h dosing
		Not for use in children <16 years of age
		Not interchangeable with two 500 mg tablets
		Not for use if Cl_{cr} <30 mL/minute or hemodialysis
Legend: CT = chewable tablet, S = suspension, T = tablet, XR = extended release.		

Acute bacterial sinusitis: Oral: Extended release tablet: Two 1000 mg tablets every 12 hours for 10 days

Bite wounds (animal/human): Oral: 875 mg every 12 hours **or** 500 mg every 8 hours

Chronic obstructive pulmonary disease: Oral: 875 mg every 12 hours **or** 500 mg every 8 hours

Diabetic foot: Oral: Extended release tablet: Two 1000 mg tablets every 12 hours for 7-14 days

Diverticulitis, perirectal abscess: Oral: Extended release tablet: Two 1000 mg tablets every 12 hours for 7-10 days

Erysipelas: Oral: 875 mg every 12 hours **or** 500 mg every 8 hours

Febrile neutropenia: Oral: 875 mg every 12 hours

Pneumonia:

Aspiration: Oral: 875 mg every 12 hours

Community-acquired: Oral: Extended release tablet: Two 1000 mg tablets every 12 hours for 7-10 days

Pyelonephritis (acute, uncomplicated): Oral: 875 mg every 12 hours **or** 500 mg every 8 hours

Skin abscess: Oral: 875 mg every 12 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Dose is based on the amoxicillin component; see “Augmentin® Product-Specific Considerations” table.

Susceptible infections: Infants <3 months: Oral: 30 mg/kg/day divided every 12 hours using the 125 mg/5 mL suspension

Lower respiratory tract infections, severe infections, sinusitis: Children ≥3 months and <40 kg: Oral: 45 mg/kg/day divided every 12 hours **or** 40 mg/kg/day divided every 8 hours

Mild-to-moderate infections: Children ≥3 months and <40 kg: Oral: 25 mg/kg/day divided every 12 hours or 20 mg/kg/day divided every 8 hours

Otitis media (Augmentin® ES-600): Children ≥3 months and <40 kg: Oral: 90 mg/kg/day divided every 12 hours for 10 days in children with severe illness and when coverage for β-lactamase positive *H. influenzae* and *M. catarrhalis* is needed.

Children >40 kg: Refer to adult dosing.

Dosing: Renal Impairment

Cl_{cr} <30 mL/minute: Do not use 875 mg tablet or extended release tablets.

Cl_{cr} 10-30 mL/minute: 250-500 mg every 12 hours

Cl_{cr} <10 mL/minute: 250-500 every 24 hours

Hemodialysis: Moderately dialyzable (20% to 50%)

250-500 mg every 24 hours; administer dose during and after dialysis. Do not use extended release tablets.

Peritoneal dialysis: Moderately dialyzable (20% to 50%)

Amoxicillin: Administer 250 mg every 12 hours

Clavulanic acid: Dose for Cl_{cr} <10 mL/minute

Continuous arteriovenous or venovenous hemofiltration effects:

Amoxicillin: ~50 mg of amoxicillin/L of filtrate is removed

Clavulanic acid: Dose for Cl_{cr} <10 mL/minute

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: OralAdminister around-the-clock to promote less variation in peak and trough serum levels. Administer with food to decrease stomach upset; shake suspension well before use. Extended release tablets should be administered with food.

Some penicillins (eg, carbenicillin, ticarcillin, and piperacillin) have been shown to inactivate aminoglycosides *in vitro*. This has been observed to a greater extent with tobramycin and gentamicin, while amikacin has shown greater stability against inactivation. Concurrent use of these agents may pose a risk of reduced antibacterial efficacy *in vivo*, particularly in the setting of profound renal impairment. However, definitive clinical evidence is lacking. If combination penicillin/aminoglycoside therapy is desired in a patient with renal dysfunction, separation of doses (if feasible), and routine monitoring of aminoglycoside levels, CBC, and clinical response should be considered.

Dietary ConsiderationsMay be taken with meals or on an empty stomach; take with meals to increase absorption and decrease GI intolerance; may mix with milk, formula, or juice. Extended release tablets should be taken with food. Some products contain phenylalanine. If you have phenylketonuria or PKU, avoid use. All dosage forms contain potassium.

Storage

Powder for oral suspension: Store dry powder at room temperature of 25°C (77°F).

Tablet: Store at room temperature of 25°C (77°F).

ReconstitutionReconstitute powder for oral suspension with appropriate amount of water as specified on the bottle. Shake vigorously until suspended. Reconstituted oral suspension should be kept in refrigerator. Discard unused suspension after 10 days. Unit-dose antibiotic oral syringes are stable for 48 hours.

ContraindicationsHypersensitivity to amoxicillin, clavulanic acid, penicillin, or any component of the formulation; history of cholestatic jaundice or hepatic dysfunction with amoxicillin/clavulanate potassium therapy; Augmentin XR™: severe renal impairment (Cl_{cr} <30 mL/minute) and hemodialysis patients

Allergy Considerations

- Penicillin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Serious and occasionally severe or fatal hypersensitivity (anaphylactoid) reactions have been reported in patients on penicillin therapy, especially with a history of beta-lactam hypersensitivity, history of sensitivity to multiple allergens, or previous IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria). Use with caution in asthmatic patients. Low incidence of cross-allergy with cephalosporins exists.

- Diarrhea: Incidence of diarrhea is higher than with amoxicillin alone.

- Hepatic effects: Although rare, hepatic dysfunction is more common in elderly and/or males, and occurs more frequently with prolonged treatment, and may occur after therapy is complete.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment.

- Infectious mononucleosis: A high percentage of patients with infectious mononucleosis have developed rash during therapy; ampicillin-class antibiotics not recommended in these patients.

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment recommended.

Dosage form specific issues:

- Clavulanic acid content: Due to differing content of clavulanic acid, not all formulations are interchangeable.

- Phenylalanine: Some products contain phenylalanine.

Geriatric Considerations Expanded coverage of this combination makes it a useful alternative when amoxicillin resistance is present and patients cannot tolerate alternative treatments; consider renal function. Considered one of the drugs of choice in the outpatient treatment of community-acquired pneumonia in elderly.

Pregnancy Risk Factor B

Pregnancy Considerations Adverse events have not been observed in animal studies; therefore, amoxicillin/clavulanate is classified as pregnancy category B. Both amoxicillin and clavulanic acid cross the placenta. There is no documented increased risk of teratogenic affects caused by amoxicillin/clavulanate. A potential increased risk of necrotizing enterocolitis in the newborn has been noted after maternal use of amoxicillin/clavulanate for preterm labor or premature prolonged rupture of membranes. When used during pregnancy, pharmacokinetic changes have been observed with amoxicillin alone (refer to the Amoxicillin monograph for details).

Lactation Enters breast milk/use caution

Breast-Feeding Considerations Amoxicillin is found in breast milk. The manufacturer recommends that caution be used if administered to breast-feeding women. The use of amoxicillin/clavulanate may be safe while breast-feeding; however, the risk of adverse events in the infant may be increased when compared to the use of amoxicillin alone. The risk of adverse events may be related to maternal dose. Nondose-related effects could include modification of bowel flora and allergic sensitization of the infant.

Pregnancy & Lactation, In-Depth

- Amoxicillin and Clavulanate Potassium in Pregnancy & Lactation

Adverse Reactions

>10%: Gastrointestinal: Diarrhea (3% to 34% incidence varies upon dose and regimen used)

1% to 10%:

Dermatologic: Diaper rash, skin rash, urticaria

Gastrointestinal: Abdominal discomfort, loose stools, nausea, vomiting

Genitourinary: Vaginitis, vaginal mycosis

Miscellaneous: Moniliasis

<1%: Cholestatic jaundice, flatulence, headache, hepatic dysfunction, prothrombin time increased, thrombocytosis

Additional adverse reactions seen with **ampicillin-class antibiotics:** Agitation, agranulocytosis, alkaline phosphatase increased, anaphylaxis, anemia, angioedema, anxiety, behavioral changes, bilirubin increased, black “hairy” tongue, confusion, convulsions, crystalluria, dizziness, enterocolitis, eosinophilia, erythema multiforme, exanthematous pustulosis, exfoliative dermatitis, gastritis, glossitis, hematuria, hemolytic anemia, hemorrhagic colitis, indigestion, insomnia, hyperactivity, interstitial nephritis, leukopenia, mucocutaneous candidiasis, pruritus, pseudomembranous colitis, serum sickness-like reaction, Stevens-Johnson syndrome, stomatitis, transaminases increased, thrombocytopenia, thrombocytopenic purpura, tooth discoloration, toxic epidermal necrolysis

Drug Interactions

Allopurinol: May enhance the potential for allergic or hypersensitivity reactions to Amoxicillin. *Risk C: Monitor therapy*

Fusidic Acid: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Methotrexate: Penicillins may decrease the excretion of Methotrexate. *Risk C: Monitor therapy*

Tetracycline Derivatives: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Penicillins. *Risk C: Monitor therapy*

Test Interactions May interfere with urinary glucose tests using cupric sulfate (Benedict's solution, Clinitest®, Fehling's solution); may inactivate aminoglycosides *in vitro*.

Some penicillin derivatives may accelerate the degradation of aminoglycosides *in vitro*, leading to a potential underestimation of aminoglycoside serum concentration.

Monitoring Parameters Assess patient at beginning and throughout therapy for infection; with prolonged therapy, monitor renal, hepatic, and hematologic function periodically; monitor for signs of anaphylaxis during first dose

Nursing: Physical Assessment/Monitoring See individual agent for Amoxicillin.

Monitoring: Lab Tests Renal, hepatic, and hematologic function periodically with prolonged therapy. Perform culture and sensitivity testing prior to initiating therapy.

Patient Education See individual agent for Amoxicillin.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Powder for oral suspension: 200: Amoxicillin 200 mg and clavulanate potassium 28.5 mg per 5 mL (50 mL, 75 mL, 100 mL) [contains phenylalanine]; 400: Amoxicillin 400 mg and clavulanate potassium 57 mg per 5 mL (50 mL, 75 mL, 100 mL) [contains phenylalanine]; 600: Amoxicillin 600 mg and clavulanate potassium 42.9 mg per 5 mL (75 mL, 125 mL, 200 mL) [contains phenylalanine]

Amoclan:

200: Amoxicillin 200 mg and clavulanate potassium 28.5 mg per 5 mL (50 mL, 75 mL, 100 mL) [contains phenylalanine 7 mg/5 mL and potassium 0.14 mEq/5 mL; fruit flavor]

400: Amoxicillin 400 mg and clavulanate potassium 57 mg per 5 mL (50 mL, 75 mL, 100 mL) [contains phenylalanine 7 mg/5 mL and potassium 0.29 mEq/5 mL; fruit flavor]

Augmentin®:

125: Amoxicillin 125 mg and clavulanate potassium 31.25 mg per 5 mL (75 mL, 100 mL, 150 mL) [contains potassium 0.16 mEq/5 mL; banana flavor]

200: Amoxicillin 200 mg and clavulanate potassium 28.5 mg per 5 mL (50 mL, 75 mL, 100 mL) [contains phenylalanine 7 mg/5 mL and potassium 0.14 mEq/5 mL; orange flavor] [DSC]

250: Amoxicillin 250 mg and clavulanate potassium 62.5 mg per 5 mL (75 mL, 100 mL, 150 mL) [contains potassium 0.32 mEq/5 mL; orange flavor]

400: Amoxicillin 400 mg and clavulanate potassium 57 mg per 5 mL (50 mL [DSC], 75 mL [DSC], 100 mL) [contains phenylalanine 7 mg/5 mL and potassium 0.29 mEq/5 mL; orange flavor]

Augmentin ES-600®: Amoxicillin 600 mg and clavulanate potassium 42.9 mg per 5 mL (75 mL, 125 mL, 200 mL) [contains phenylalanine 7 mg/5 mL and potassium 0.23 mEq/5 mL; strawberry cream flavor]

Tablet: 250: Amoxicillin 250 mg and clavulanate potassium 125 mg; 500: Amoxicillin 500 mg and clavulanate potassium 125 mg; 875: Amoxicillin 875 mg and clavulanate potassium 125 mg

Augmentin®:

250: Amoxicillin 250 mg and clavulanate potassium 125 mg [contains potassium 0.63 mEq/tablet]

500: Amoxicillin 500 mg and clavulanate potassium 125 mg [contains potassium 0.63 mEq/tablet]

875: Amoxicillin 875 mg and clavulanate potassium 125 mg [contains potassium 0.63 mEq/tablet]

Tablet, chewable: 200: Amoxicillin 200 mg and clavulanate potassium 28.5 mg [contains phenylalanine]; 400: Amoxicillin 400 mg and clavulanate potassium 57 mg [contains phenylalanine]

Augmentin®:

125: Amoxicillin 125 mg and clavulanate potassium 31.25 mg [contains potassium 0.16 mEq/tablet; lemon-lime flavor] [DSC]

200: Amoxicillin 200 mg and clavulanate potassium 28.5 mg [contains phenylalanine 2.1 mg/tablet and potassium 0.14 mEq/tablet; cherry-banana flavor] [DSC]

250: Amoxicillin 250 mg and clavulanate potassium 62.5 mg [contains potassium 0.32 mEq/tablet; lemon-lime flavor]

400: Amoxicillin 400 mg and clavulanate potassium 57 mg [contains phenylalanine 4.2 mg/tablet and potassium 0.29 mEq/tablet; cherry-banana flavor] [DSC]

Tablet, extended release:

Augmentin XR®: Amoxicillin 1000 mg and clavulanate acid 62.5 mg [contains potassium 12.6 mg (0.32 mEq) and sodium 29.3 mg (1.27 mEq) per tablet; packaged in either a 7-day or 10-day package]

Generic AvailableYes: Excludes extended release
ManufacturerGlaxoSmithKline
Pricing: U.S. (www.drugstore.com)

Chewable (Amoxicillin-Pot Clavulanate)

400-57 mg (20): $63.79

Suspension (reconstituted) (Amoxicillin-Pot Clavulanate)

600-42.9 mg/5 mL (75): $35.99

Tablet, 12-hour (Augmentin XR)

1000-62.5 mg (28): $111.14

Tablets (Amoxicillin-Pot Clavulanate)

250-125 mg (30): $116.54

500-125 mg (20): $45.99

875-125 mg (20): $95.97

Tablets (Augmentin)

250-125 mg (30): $118.99

500-125 mg (30): $166.71

875-125 mg (20): $145.99

Mechanism of ActionClavulanic acid binds and inhibits beta-lactamases that inactivate amoxicillin resulting in amoxicillin having an expanded spectrum of activity. Amoxicillin inhibits bacterial cell wall synthesis by binding to one or more of the penicillin-binding proteins (PBPs) which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.

Pharmacodynamics/KineticsAmoxicillin pharmacokinetics are not affected by clavulanic acid.

Amoxicillin: See Amoxicillin monograph.

Clavulanic acid:

Protein binding: ~25%

Metabolism: Hepatic

Half-life elimination: 1 hour

Time to peak: 1 hour

Excretion: Urine (30% to 40% as unchanged drug)

Related Information

- Amoxicillin

Pharmacotherapy PearlsTwo 250 mg tablets are not equivalent to a 500 mg tablet (both tablet sizes contain equivalent clavulanate). Two 500 mg tablets are not equivalent to a single 1000 mg extended release tablet.

Dental Health Professional ConsiderationsIn maxillary sinus, anterior nasal cavity, and deep neck infections, beta-lactamase-producing staphylococci and beta-lactamase-producing *Bacteroides* usually are present. In these situations, antibiotics that resist the beta-lactamase enzyme are indicated. Amoxicillin and clavulanic acid is administered orally for moderate infections. Ampicillin sodium and sulbactam sodium (Unasyn®) is administered parenterally for more severe infections.

Dental Health: Effects on Dental TreatmentProlonged use of penicillins may lead to development of oral candidiasis (see Dental Comment)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusPenicillins have been reported to cause apprehension, illusions, agitation, insomnia, depersonalization, and encephalopathy

Mental Health: Effects on Psychiatric TreatmentDisulfiram may increase amoxicillin levels

Index TermsAmoxicillin and Clavulanic Acid; Clavulanic Acid and Amoxicillin

Medication Safety Issues

Sound-alike/look-alike issues:

Amoxicillin may be confused with amoxapine, Amoxil®, Atarax®

Amoxil® may be confused with amoxapine, amoxicillin

International issues:

Fisamox® [Australia] may be confused with Fosamax® which is a brand name for alendronate in the U.S.

Fisamox® [Australia] may be confused with Vigamox™ which is a brand name for moxifloxacin in the U.S.

Pronunciation(a moks i SIL in)

U.S. Brand NamesAmoxil®

Canadian Brand NamesApo-Amoxi®; Gen-Amoxicillin; Lin-Amox; Novamoxin®; Nu-Amoxi; PHL-Amoxicillin; PMS-Amoxicillin

Pharmacologic CategoryAntibiotic, Penicillin

Use: Labeled IndicationsTreatment of otitis media, sinusitis, and infections caused by susceptible organisms involving the respiratory tract, skin, and urinary tract; prophylaxis of infective endocarditis in patients undergoing surgical or dental procedures; as part of a multidrug regimen for *H. pylori* eradication

Use: Unlabeled/InvestigationalPostexposure prophylaxis for anthrax exposure with documented susceptible organisms

Use: DentalAntibiotic for standard prophylactic regimen for dental patients who are at risk for infective endocarditis; prophylaxis in total joint replacement patients undergoing dental procedures which produce bacteremia; antibiotic used to treat orofacial infections

Dosing: Adults

Usual dosage range: Oral: 250-500 mg every 8 hours or 500-875 mg twice daily

Anthrax exposure (CDC guidelines): Oral: **Note:** Postexposure prophylaxis in pregnant or nursing women only with documented susceptible organisms: 500 mg every 8 hours

Ear, nose, throat, genitourinary tract, or skin/skin structure infections:

Mild to moderate: Oral: 500 mg every 12 hours **or** 250 mg every 8 hours

Severe: Oral: 875 mg every 12 hours **or** 500 mg every 8 hours

***Helicobacter pylori*eradication:** Oral: 1000 mg twice daily; requires combination therapy with at least one other antibiotic and an acid-suppressing agent (proton pump inhibitor or H_2 blocker)

Lower respiratory tract infections: Oral: 875 mg every 12 hours **or** 500 mg every 8 hours

Lyme disease: Oral: 500 mg every 6-8 hours (depending on size of patient) for 21-30 days

Prophylaxis against infective endocarditis: Oral: 2 g 30-60 minutes before procedure. **Note:** American Heart Association (AHA) guidelines now recommend prophylaxis only in patients undergoing invasive procedures and in whom underlying cardiac conditions may predispose to a higher risk of adverse outcomes should infection occur. As of April 2007, routine prophylaxis for GI/GU procedures is no longer recommended by the AHA.

Prophylaxis in total joint replacement patients undergoing dental procedures which produce bacteremia: 2 g 1 hour prior to procedure

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Usual dosage range:

Children ≤3 months: Oral: 20-30 mg/kg/day divided every 12 hours

Children >3 months and <40 kg: Oral: 20-50 mg/kg/day in divided doses every 8-12 hours

Acute otitis media: Children >3 months and <40 kg: Oral: 80-90 mg/kg/day divided every 12 hours

Anthrax exposure (CDC guidelines): Children >3 months and <40 kg: Oral: **Note:** Postexposure prophylaxis only with documented susceptible organisms: 80 mg/kg/day in divided doses every 8 hours (maximum: 500 mg/dose)

Community-acquired pneumonia:

4 months to <5 years: 80-100 mg/kg/day divided every 8 hours

5-15 years: 100 mg/kg/day divided every 8 hours; **Note:** Treatment with a macrolide or doxycycline (if age >8 years) is preferred due to higher prevalence of atypical pathogens in this age group

Ear, nose, throat, genitourinary tract, or skin/skin structure infections: Children >3 months and <40 kg: Oral:

Mild to moderate: 25 mg/kg/day in divided doses every 12 hours **or** 20 mg/kg/day in divided doses every 8 hours

Severe: 45 mg/kg/day in divided doses every 12 hours **or** 40 mg/kg/day in divided doses every 8 hours

Lower respiratory tract infections: Children >3 months and <40 kg: Oral: 45 mg/kg/day in divided doses every 12 hours **or** 40 mg/kg/day in divided doses every 8 hours

Lyme disease: Children >3 months and <40 kg: Oral: 25-50 mg/kg/day divided every 8 hours (maximum: 500 mg)

Prophylaxis against infective endocarditis: Children >3 months and <40 kg: Oral: 50 mg/kg 1 hour before procedure. **Note:** American Heart Association (AHA) guidelines now recommend prophylaxis only in patients undergoing invasive procedures and in whom underlying cardiac conditions may predispose to a higher risk of adverse outcomes should infection occur. As of April 2007, routine prophylaxis for GI/GU procedures is no longer recommended by the AHA.

Dosing: Renal Impairment

The 875 mg tablet should not be used in patients with Cl_{cr} <30 mL/minute.

Cl_{cr} 10-30 mL/minute: 250-500 mg every 12 hours

Cl_{cr} <10 mL/minute: 250-500 mg every 24 hours

Moderately dialyzable (20% to 50%) by hemodialysis or peritoneal dialysis; approximately 50 mg of amoxicillin per liter of filtrate is removed by continuous arteriovenous or venovenous hemofiltration. Dose as per Cl_{cr} <10 mL/minute guidelines.

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: Oral Administer around-the-clock to promote less variation in peak and trough serum levels. The appropriate amount of suspension may be mixed with formula, milk, fruit juice, water, ginger ale, or cold drinks; administer dose immediately after mixing.

Some penicillins (eg, carbenicillin, ticarcillin, and piperacillin) have been shown to inactivate aminoglycosides *in vitro*. This has been observed to a greater extent with tobramycin and gentamicin, while amikacin has shown greater stability against inactivation. Concurrent use of these agents may pose a risk of reduced antibacterial efficacy *in vivo*, particularly in the setting of profound renal impairment. However, definitive clinical evidence is lacking. If combination penicillin/aminoglycoside therapy is desired in a patient with renal dysfunction, separation of doses (if feasible), and routine monitoring of aminoglycoside levels, CBC, and clinical response should be considered.

Dietary Considerations May be taken with food. Amoxil® chewable contains phenylalanine 1.82 mg per 200 mg tablet, phenylalanine 3.64 mg per 400 mg tablet.

Storage Amoxil®: Oral suspension remains stable for 14 days at room temperature or if refrigerated (refrigeration preferred). Unit-dose antibiotic oral syringes are stable for 48 hours.

Contraindications Hypersensitivity to amoxicillin, penicillin, or any component of the formulation

Allergy Considerations

- Penicillin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Serious and occasionally severe or fatal hypersensitivity (anaphylactoid) reactions have been reported in patients on penicillin therapy, especially with a history of beta-lactam hypersensitivity, history of sensitivity to multiple allergens, or previous IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria). Use with caution in asthmatic patients.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Infectious mononucleosis: A high percentage of patients with infectious mononucleosis have developed rash during therapy; ampicillin-class antibiotics not recommended in these patients.

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment recommended.

Dosage form specific issues:

- Phenylalanine: Chewable tablets contain phenylalanine.

Geriatric Considerations Resistance to amoxicillin has been a problem in patients on frequent antibiotics or in nursing homes. Alternative antibiotics may be necessary in these populations. Consider renal function.

Pregnancy Risk Factor B

Pregnancy Considerations Adverse events have not been observed in animal studies; therefore, amoxicillin is classified as pregnancy category B. There is no documented increased risk of adverse pregnancy outcome or teratogenic affects caused by amoxicillin. It is the drug of choice for the treatment of chlamydial infections in pregnancy and for anthrax prophylaxis when penicillin susceptibility is documented.

Due to pregnancy-induced physiologic changes, amoxicillin clearance is increased during pregnancy resulting in lower concentrations and smaller AUCs. Oral ampicillin-class antibiotics are poorly-absorbed during labor.

LactationEnters breast milk/compatible

Breast-Feeding ConsiderationsVery small amounts of amoxicillin are excreted in breast milk. The manufacturer recommends that caution be exercised when administering amoxicillin to nursing women. The AAP considers amoxicillin to be “usually compatible with breastfeeding." Nondose-related effects could include modification of bowel flora and allergic sensitization of the infant.

Pregnancy & Lactation, In-Depth

- Amoxicillin in Pregnancy & Lactation

Adverse ReactionsFrequency not defined.

Central nervous system: Hyperactivity, agitation, anxiety, insomnia, confusion, convulsions, behavioral changes, dizziness

Dermatologic: Acute exanthematous pustulosis, erythematous maculopapular rash, erythema multiforme, mucocutaneous candidiasis, Stevens-Johnson syndrome, exfoliative dermatitis, toxic epidermal necrolysis, hypersensitivity vasculitis, urticaria

Gastrointestinal: Black hairy tongue, nausea, diarrhea, hemorrhagic colitis, pseudomembranous colitis, tooth discoloration (brown, yellow, or gray; rare), vomiting

Hematologic: Anemia, hemolytic anemia, thrombocytopenia, thrombocytopenia purpura, eosinophilia, leukopenia, agranulocytosis

Hepatic: AST and ALT increased, cholestatic jaundice, hepatic cholestasis, acute cytolytic hepatitis

Renal: Crystalluria

Drug Interactions

Allopurinol: May enhance the potential for allergic or hypersensitivity reactions to Amoxicillin. *Risk C: Monitor therapy*

Fusidic Acid: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Methotrexate: Penicillins may decrease the excretion of Methotrexate. *Risk C: Monitor therapy*

Tetracycline Derivatives: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Penicillins. *Risk C: Monitor therapy*

Test InteractionsMay interfere with urinary glucose tests using cupric sulfate (Benedict's solution, Clinitest®)

Some penicillin derivatives may accelerate the degradation of aminoglycosides *in vitro*, leading to a potential underestimation of aminoglycoside serum concentration.

Monitoring ParametersWith prolonged therapy, monitor renal, hepatic, and hematologic function periodically; assess patient at beginning and throughout therapy for infection; monitor for signs of anaphylaxis during first dose

Nursing: Physical Assessment/MonitoringAssess culture and sensitivity report and patient allergy history prior to starting therapy. Assess potential for interactions with other medications patient may be taking. Caution patients with diabetes about altered response to Clinitest®. Assess for therapeutic effectiveness and adverse reactions (eg, opportunistic infection [fever, chills, unhealed sores, white plaques in mouth or vagina, purulent vaginal discharge, fatigue] - see Adverse Reactions and Overdose/Toxicology). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsPerform culture and sensitivity testing prior to initiating therapy.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take entire prescription, even if you are feeling better. Take at equal intervals around-the-clock. May be taken with milk, juice, or food. If you have diabetes, drug may cause false test results with Clinitest® urine glucose monitoring; use of another type of glucose monitoring is preferable. May cause nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report rash; unusual or persistent diarrhea; vaginal itching, burning, or pain; unresolved vomiting or constipation; fever or chills; abdominal pain; jaundice; unusual bruising or bleeding; opportunistic infection [fever, chills, unhealed sores, white plaques in mouth or vagina, purulent vaginal discharge, fatigue]; or if condition being treated worsens or does not improve by the time prescription is completed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule: 250 mg, 500 mg

Amoxil®: 500 mg

Powder for oral suspension: 125 mg/5 mL (80 mL, 100 mL, 150 mL); 200 mg/5 mL (50 mL, 75 mL, 100 mL); 250 mg/5 mL (80 mL, 100 mL, 150 mL); 400 mg/5 mL (50 mL, 75 mL, 100 mL)

Amoxil®: 200 mg/5 mL (50 mL, 75 mL, 100 mL) [contains sodium benzoate; bubble gum flavor] [DSC]; 250 mg/5 mL (100 mL, 150 mL) [contains sodium benzoate; bubble gum flavor]; 400 mg/5 mL (5 mL [DSC], 50 mL [DSC], 75 mL [DSC], 100 mL) [contains sodium benzoate; bubble gum flavor]

Powder for oral suspension [drops]:

Amoxil®: 50 mg/mL (30 mL) [contains sodium benzoate; bubble gum flavor]

Tablet: 500 mg, 875 mg

Amoxil®: 500 mg, 875 mg [DSC]

Tablet, chewable: 125 mg, 200 mg, 250 mg, 400 mg

Amoxil®: 200 mg [contains phenylalanine 1.82 mg/tablet; cherry banana peppermint flavor] [DSC]; 400 mg [contains phenylalanine 3.64 mg/tablet; cherry banana peppermint flavor] [DSC]

Generic AvailableYes: Excludes drops

875 mg (21): $21.99

Mechanism of ActionInhibits bacterial cell wall synthesis by binding to one or more of the penicillin-binding proteins (PBPs) which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.
Pharmacodynamics/Kinetics

Absorption: Oral: Rapid and nearly complete; food does not interfere

Distribution: Widely to most body fluids and bone; poor penetration into cells, eyes, and across normal meninges

Pleural fluids, lungs, and peritoneal fluid; high urine concentrations are attained; also into synovial fluid, liver, prostate, muscle, and gallbladder; penetrates into middle ear effusions, maxillary sinus secretions, tonsils, sputum, and bronchial secretions

CSF:blood level ratio: Normal meninges: <1%; Inflamed meninges: 8% to 90%

Protein binding: 17% to 20%

Metabolism: Partially hepatic

Half-life elimination:

Neonates, full-term: 3.7 hours

Infants and Children: 1-2 hours

Adults: Normal renal function: 0.7-1.4 hours

Cl_{cr} <10 mL/minute: 7-21 hours

Time to peak: Capsule: 2 hours; Suspension: 1 hour

Excretion: Urine (80% as unchanged drug); lower in neonates

Related Information

- Antimicrobial Drugs of Choice
- Community-Acquired Pneumonia in Adults
- Prevention of Infective Endocarditis
- Treatment of Sexually-Transmitted Infections

Dental Health: Effects on Dental TreatmentProlonged use of penicillins may lead to development of oral candidiasis

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusRarely large doses may produce confusion, hallucinations, and depression; penicillins have been reported to cause apprehension, illusions, agitation, insomnia, depersonalization, and encephalopathy

Mental Health: Effects on Psychiatric TreatmentDisulfiram may increase amoxicillin levels

Cardiovascular ConsiderationsFor the prevention of bacterial endocarditis, amoxicillin 2 g orally can be given 1 hour before, in the absence of a contraindication, for a dental, oral, respiratory tract, or esophageal procedure.

Index Terms*p*-Hydroxyampicillin; Amoxicillin Trihydrate; Amoxycillin

Medication Safety Issues

Safety issues:

Conventional amphotericin formulations (Amphocin®, Fungizone®) may be confused with lipid-based formulations (AmBisome®, Abelcet®, Amphotec®).

Large overdoses have occurred when conventional formulations were dispensed inadvertently for lipid-based products. Single daily doses of conventional amphotericin formulation never exceed 1.5 mg/kg.

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication (intrathecal administration) among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(am foe TER i sin bee con VEN sha nal)

U.S. Brand NamesAmphocin® [DSC]

Canadian Brand NamesFungizone®

Pharmacologic CategoryAntifungal Agent, Parenteral

Use: Labeled IndicationsTreatment of severe systemic and central nervous system infections caused by susceptible fungi such as *Candida* species, *Histoplasma capsulatum*, *Cryptococcus neoformans*, *Aspergillus* species, *Blastomyces dermatitidis*, *Torulopsis glabrata*, and *Coccidioides immitis*; fungal peritonitis; irrigant for bladder fungal infections; used in fungal infection in patients with bone marrow transplantation, amebic meningoencephalitis, ocular aspergillosis (intraocular injection), candidal cystitis (bladder irrigation), chemoprophylaxis (low-dose I.V.), immunocompromised patients at risk of aspergillosis (intranasal/nebulized), refractory meningitis (intrathecal), coccidioidal arthritis (intra-articular/I.M.).

Low-dose amphotericin B has been administered after bone marrow transplantation to reduce the risk of invasive fungal disease.

Dosing: Adults

Note: Premedication: For patients who experience infusion-related immediate reactions, premedicate with the following drugs 30-60 minutes prior to drug administration: NSAID (with or without diphenhydramine) **or** acetaminophen with diphenhydramine **or** hydrocortisone 50-100 mg. If the patient experiences rigors during the infusion, meperidine may be administered.

Test dose: I.V.: 1 mg infused over 20-30 minutes. Many clinicians believe a test dose is unnecessary.

Aspergillosis, disseminated: I.V.: 0.6-0.7 mg/kg/day for 3-6 months

Bone marrow transplantation (prophylaxis): I.V.: Low-dose amphotericin B 0.1-0.25 mg/kg/day has been administered after bone marrow transplantation to reduce the risk of invasive fungal disease.

Candidemia (neutropenic or non-neutropenic): I.V.: 0.6-1 mg/kg/day until 14 days after last positive blood culture and resolution of signs and symptoms

Candidiasis, chronic, disseminated: I.V.: 0.6-0.7 mg/kg/day for 3-6 months and resolution of radiologic lesions

Cystitis (Candidal): Bladder irrigation: Irrigate with 50 mcg/mL solution instilled periodically or continuously for 5-10 days or until cultures are clear.

Dematiaceous fungi: I.V.: 0.7 mg/kg/day in combination with an azole

Endocarditis: I.V.: 0.6-1 mg/kg/day (with or without flucytosine) for 1 week, then 0.8 mg/kg/day every other day for 6-8 weeks postoperatively

Endophthalmitis, fungal:

Intravitreal (unlabeled): 10 mcg in 0.1 mL (in conjunction with systemic therapy)

I.V.: 0.7-1 mg/kg/day (with or without flucytosine) for at least 4 weeks

Esophagitis: I.V.: 0.3-0.7 mg/kg/day for 14-21 after clinical improvement

Histoplasmosis: Chronic, severe pulmonary or disseminated: I.V.: 0.5-1 mg/kg/day for 7 days, then 0.8 mg/kg every other day (or 3 times/week) until total dose of 10-15 mg/kg; may continue itraconazole as suppressive therapy (lifelong for immunocompromised patients)

Meningitis:

Candidal: I.V.: 0.7-1 mg/kg/day (with or without flucytosine) for at least 4 weeks

Cryptococcal or Coccidioides: I.T.: Initial: 25-300 mcg every 48-72 hours; increase to 500 mcg to 1 mg as tolerated; maximum total dose: 15 mg has been suggested

Histoplasma: I.V.: 0.5-1 mg/kg/day for 7 days, then 0.8 mg/kg every other day (or 3 times/week) for 3 months total duration; follow with fluconazole suppressive therapy for up to 12 months

Meningoencephalitis, cryptococcal: I.V.:

HIV positive: 0.7-1 mg/kg/day (plus flucytosine 100 mg/kg/day) for 2 weeks, then change to oral fluconazole for at least 10 weeks; alternatively, amphotericin and flucytosine may be continued uninterrupted for 6-10 weeks

HIV negative: 0.5-0.7 mg/kg/day (plus flucytosine) for 2 weeks

Osteomyelitis: Candidal: I.V.: 0.5-1 mg/kg/day for 6-10 weeks

Penicillium marneffei: I.V.: 0.6 mg/kg/day for 2 weeks

Pneumonia: Cryptococcal (mild to moderate): I.V.:

HIV positive: 0.5-1 mg/kg/day

HIV negative: 0.5-0.7 mg/kg/day (plus flucytosine) for 2 weeks

Sporotrichosis: Pulmonary, meningeal, osteoarticular or disseminated: I.V.: Total dose of 1-2 g, then change to oral itraconazole or fluconazole for suppressive therapy

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Note: Premedication: For patients who experience infusion-related immediate reactions, premedicate with the following drugs 30-60 minutes prior to drug administration: NSAID (with or without diphenhydramine) **or** acetaminophen with diphenhydramine **or** hydrocortisone 50-100 mg. If the patient experiences rigors during the infusion, meperidine may be administered.

Test dose: I.V.: Infants and Children: 0.1 mg/kg/dose to a maximum of 1 mg; infuse over 30-60 minutes. Many clinicians believe a test dose is unnecessary.

Susceptible fungal infections: I.V.: Infants and Children: Maintenance dose: 0.25-1 mg/kg/day given once daily; infuse over 2-6 hours. Once therapy has been established, amphotericin B can be administered on an every-other-day basis at 1-1.5 mg/kg/dose; cumulative dose: 1.5-2 g over 6-10 weeks

Note: Duration of therapy varies with nature of infection: Usual duration is 4-12 weeks or cumulative dose of 1-4 g.

Meningitis, coccidioidal or cryptococcal: I.T.: Children: 25-100 mcg every 48-72 hours; increase to 500 mcg as tolerated

Dosing: Renal Impairment

If renal dysfunction is due to the drug, the daily total can be decreased by 50% or the dose can be given every other day. I.V. therapy may take several months.

Poorly dialyzed; no supplemental dose is necessary when using hemo- or peritoneal dialysis or continuous renal replacement therapy (CRRT).

Administration in dialysate: 1-2 mg/L of peritoneal dialysis fluid either with or without low-dose I.V. amphotericin B (a total dose of 2-10 mg/kg given over 7-14 days).

Administration: I.V.May be infused over 4-6 hours. For a patient who experiences chills, fever, hypotension, nausea, or other nonanaphylactic infusion-related reactions, premedicate with the following drugs 30-60 minutes prior to drug administration: A nonsteroidal (eg, ibuprofen, choline magnesium trisalicylate) with or without diphenhydramine **or** acetaminophen with diphenhydramine **or** hydrocortisone 50-100 mg. If the patient experiences rigors during the infusion, meperidine may be administered. Bolus infusion of normal saline immediately preceding, or immediately preceding and following amphotericin B may reduce drug-induced nephrotoxicity. Risk of nephrotoxicity increases with amphotericin B doses >1 mg/kg/day. Infusion of admixtures more concentrated than 0.25 mg/mL should be limited to patients absolutely requiring volume contraction.

Administration: I.V. DetailPrecipitate may form in ionic dialysate solutions.

pH: 5.7 (100 mg/L in D_5W)

StorageStore intact vials under refrigeration; protect from light. Reconstituted vials are stable, protected from light, for 24 hours at room temperature and 1 week when refrigerated. Parenteral admixtures are stable, protected from light, for 24 hours at room temperature and 2 days under refrigeration. Short-term exposure (<24 hours) to light during I.V. infusion does **not** appreciably affect potency.

ReconstitutionAdd 10 mL of SWFI (without a bacteriostatic agent) to each vial of amphotericin B. Further dilute with 250-500 mL D_5W; final concentration should not exceed 0.1 mg/mL (peripheral infusion) or 0.25 mg/mL (central infusion).

Compatibility

Solution compatibility:

Compatible: Heparin sodium, hydrocortisone, sodium bicarbonate.

Incompatible: Ampicillin, calcium gluconate, carbenicillin, cimetidine, dopamine, gentamicin, lidocaine, potassium chloride, sodium chloride, tetracycline, verapamil.

ContraindicationsHypersensitivity to amphotericin or any component of the formulation

Allergy Considerations

- Amphotericin Derivative Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis: Has been reported with amphotericin B-containing drugs; facilities for cardiopulmonary resuscitation should be available during administration due to the possibility of anaphylactic reaction. If severe respiratory distress occurs, the infusion should be immediately discontinued; during the initial dosing, the drug should be administered under close clinical observation.

- Infusion reactions: Acute reactions (including fever and chills) may occur 1-3 hours after starting an intravenous infusion. These reactions are usually more common with the first few doses and generally diminish with subsequent doses.

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- Nephrotoxic drugs: Avoid use with other nephrotoxic drugs; drug-induced renal toxicity usually improves with interrupting therapy, decreasing dosage, or increasing dosing interval.

Special populations:

- Neutropenic patients: Pulmonary reactions may occur in neutropenic patients receiving leukocyte transfusions; separation of the infusions as much as possible is advised.

Geriatric ConsiderationsThe pharmacokinetics and dosing of amphotericin have not been studied in elderly. It appears that use is similar to young adults; caution should be exercised and renal function and desired effect monitored closely.

Pregnancy Risk FactorB

LactationExcretion in breast milk unknown/contraindicated

Adverse Reactions

Systemic:

>10%:

Cardiovascular: Hypotension, tachypnea

Central nervous system: Fever, chills, headache (less frequent with I.T.), malaise

Endocrine & metabolic: Hypokalemia, hypomagnesemia

Gastrointestinal: Anorexia, nausea (less frequent with I.T.), vomiting (less frequent with I.T.), diarrhea, heartburn, cramping epigastric pain

Hematologic: Normochromic-normocytic anemia

Local: Pain at injection site with or without phlebitis or thrombophlebitis (incidence may increase with peripheral infusion of admixtures)

Neuromuscular & skeletal: Generalized pain, including muscle and joint pains (less frequent with I.T.)

Renal: Decreased renal function and renal function abnormalities including azotemia, renal tubular acidosis, nephrocalcinosis (>0.1 mg/mL)

1% to 10%:

Cardiovascular: Hypertension, flushing

Central nervous system: Delirium, arachnoiditis, pain along lumbar nerves (especially I.T. therapy)

Genitourinary: Urinary retention

Hematologic: Leukocytosis

Neuromuscular & skeletal: Paresthesia (especially with I.T. therapy)

<1% (Limited to important or life-threatening): Acute liver failure, agranulocytosis, anuria, bone marrow suppression, cardiac arrest, coagulation defects, convulsions, dyspnea, hearing loss, leukopenia, maculopapular rash, renal failure, renal tubular acidosis, thrombocytopenia, vision changes

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Aminoglycosides: Amphotericin B may enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Colistimethate: Amphotericin B may enhance the nephrotoxic effect of Colistimethate. *Risk D: Consider therapy modification*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

CycloSPORINE: Amphotericin B may enhance the nephrotoxic effect of CycloSPORINE. *Risk C: Monitor therapy*

Gallium Nitrate: Amphotericin B may enhance the nephrotoxic effect of Gallium Nitrate. *Risk X: Avoid combination*

Saccharomyces boulardii: Antifungal Agents may diminish the therapeutic effect of Saccharomyces boulardii. *Risk D: Consider therapy modification*

Test InteractionsIncreased BUN (S), serum creatinine, alkaline phosphate, bilirubin; decreased magnesium, potassium (S)

Monitoring ParametersRenal function (monitor frequently during therapy), electrolytes (especially potassium and magnesium), liver function tests, temperature, PT/PTT, CBC; monitor input and output; monitor for signs of hypokalemia (muscle weakness, cramping, drowsiness, ECG changes, etc)

Reference RangeTherapeutic: 1-2 mcg/mL (SI: 1-2.2 µmol/L)

Nursing: Physical Assessment/MonitoringAssess culture and sensitivity report and patient's previous exposure to amphotericin B prior to starting therapy. Assess potential for interactions with other medications patient may be taking (eg, other nephrotoxic drugs). See Administration for specific infusion directions and premedication recommendations prior to administering first dose. Patient should be monitored closely for infusion-related reactions (eg, anaphylaxis, chills, fever, nausea, vomiting, rigors, hypotension, acute respiratory distress) and cardiopulmonary resuscitation should be available. If acute respiratory distress occurs, infusion should be stopped and prescriber notified. Assess results of laboratory tests, therapeutic effectiveness, and adverse response frequently during therapy. Teach patient appropriate use, possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsBUN and serum creatinine levels should be determined every other day when therapy is increased and at least weekly thereafter. Monitor serum electrolytes (especially potassium and magnesium), liver function, and CBC. Perform culture and sensitivity testing prior to initiating therapy.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. I.V.: You will be monitored closely during and after infusion; report immediately any pain or swelling at infusion site, chills, nausea, chest pain, swelling of face or mouth, difficulty breathing, muscle cramping, acute anxiety, or other infusion reactions. Take entire prescription, even if you are feeling better. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause nausea, vomiting, or anorexia (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); generalized muscle or joint pain (consult prescriber for approved analgesic); or hypotension (use caution when rising from sitting or lying position or when climbing stairs). Report severe muscle cramping or weakness; chest pain or palpitations; CNS disturbances; skin rash; change in urinary patterns or difficulty voiding; black stool; unusual bruising or bleeding; or pain, redness, or swelling at infusion site. **Breast-feeding precaution:** Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Injection, powder for reconstitution, as desoxycholate: 50 mg

Amphocin®: 50 mg [DSC]

Generic AvailableYes

Mechanism of ActionBinds to ergosterol altering cell membrane permeability in susceptible fungi and causing leakage of cell components with subsequent cell death. Proposed mechanism suggests that amphotericin causes an oxidation-dependent stimulation of macrophages (Lyman, 1992).

Pharmacodynamics/Kinetics

Distribution: Minimal amounts enter the aqueous humor, bile, CSF (inflamed or noninflamed meninges), amniotic fluid, pericardial fluid, pleural fluid, and synovial fluid

Protein binding, plasma: 90%

Half-life elimination: Biphasic: Initial: 15-48 hours; Terminal: 15 days

Time to peak: Within 1 hour following a 4- to 6-hour dose

Excretion: Urine (2% to 5% as biologically active form); ~40% eliminated over a 7-day period and may be detected in urine for at least 7 weeks after discontinued use

Related Information

- Antifungal Agents
- Desensitization Protocols
- USPHS / IDSA Guidelines for the Prevention of Opportunistic Infections in Persons Infected With HIV

Pharmacotherapy PearlsPremedication with diphenhydramine and acetaminophen may reduce the severity of acute infusion-related reactions. Meperidine reduces the duration of amphotericin B-induced rigors and chilling. Hydrocortisone may be used in patients with severe or refractory infusion-related reactions. Bolus infusion of normal saline immediately preceding, or immediately preceding and following amphotericin B may reduce drug-induced nephrotoxicity. Risk of nephrotoxicity increases with amphotericin B doses >1 mg/kg/day. Infusion of admixtures more concentrated than 0.25 mg/mL should be limited to patients absolutely requiring volume restriction. Amphotericin B does not have a bacteriostatic constituent, subsequently admixture expiration is determined by sterility more than chemical stability.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation is common; may cause delirium

Mental Health: Effects on Psychiatric TreatmentMay cause bone marrow suppression; use caution with clozapine and carbamazepine

Anesthesia and Critical Care Concerns/Other ConsiderationsPatients may be premedicated with acetaminophen and diphenhydramine 30 minutes prior to the amphotericin infusion. Meperidine (Demerol®) may help to reduce rigors. Avoid rapid injection (usually 4- to 6-hour infusion required). Dosage adjustments are not necessary with renal impairment. If decreased renal function is due to amphotericin, the daily dose can be decreased by 50% or the dose can be given every other day.

Hydrocortisone may be used in patients with severe or refractory infusion-related reactions. Bolus infusion of normal saline immediately preceding, or immediately preceding and following amphotericin B may reduce drug-induced nephrotoxicity. Risk of nephrotoxicity increases with amphotericin B doses >1 mg/kg/day. Infusion of admixtures more concentrated than 0.25 mg/mL should be limited to patients absolutely requiring volume restriction. Amphotericin B does not have a bacteriostatic constituent, subsequently admixture expiration is determined by sterility more than chemical stability.

Jump To Field (Select Field Name)

Medication Safety Issues

Safety issues:

Lipid-based amphotericin formulations (Abelcet®) may be confused with conventional formulations (Amphocin®, Fungizone®)

Large overdoses have occurred when conventional formulations were dispensed inadvertently for lipid-based products. Single daily doses of conventional amphotericin formulation never exceed 1.5 mg/kg.

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(am foe TER i sin bee LIP id KOM pleks)

U.S. Brand NamesAbelcet®

Canadian Brand NamesAbelcet®; Amphotec®

Pharmacologic CategoryAntifungal Agent, Parenteral

Use: Labeled IndicationsTreatment of aspergillosis or any type of progressive fungal infection in patients who are refractory to or intolerant of conventional amphotericin B therapy

Use: Unlabeled/InvestigationalEffective in patients with serious *Candida* species infections

Dosing: Adults

Note: Premedication: For patients who experience infusion-related immediate reactions, premedicate with the following drugs 30-60 minutes prior to drug administration: A nonsteroidal anti-inflammatory agent ± diphenhydramine **or** acetaminophen with diphenhydramine **or** hydrocortisone 50-100 mg. If the patient experiences rigors during the infusion, meperidine may be administered.

Usual dosage: I.V.: 2.5-5 mg/kg/day as a single infusion

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

Dosing: Renal ImpairmentThe effects of renal impairment on drug pharmacokinetics or pharmacodynamics are currently unknown. The dose of amphotericin B lipid complex may be adjusted or drug administration may have to be interrupted in patients with acute kidney dysfunction to reduce the magnitude of renal impairment.

Hemodialysis: Supplemental dose is not necessary.

Peritoneal dialysis: Supplemental dose is not necessary.

Continuous renal replacement therapy (CRRT): No supplemental dosage necessary

Administration: I.V.For patients who experience nonanaphylactic infusion-related reactions, premedicate 30-60 minutes prior to drug administration with a nonsteroidal anti-inflammatory agent ± diphenhydramine **or** acetaminophen with diphenhydramine **or** hydrocortisone 50-100 mg. If the patient experiences rigors during the infusion, meperidine may be administered.

Invert infusion container several times prior to administration and every 2 hours during infusion.

Administration: I.V. DetailDo not use an in-line filter. Flush line with dextrose; normal saline may cause precipitate.

StorageIntact vials should be stored at 2°C to 8°C (35°F to 46°F) and protected from exposure to light; do not freeze intact vials. Solutions for infusion are stable for 48 hours under refrigeration and 6 hours at room temperature. Protect from light. Following reconstitution, protect from light.

ReconstitutionShake vial gently to disperse yellow sediment at bottom of container. Dilute with D_5W to 1-2 mg/mL.

Compatibility

Incompatible with any blood products, intravenous drugs, or intravenous fluids other than D_5W when admixed or as Y-site administration.

ContraindicationsHypersensitivity to amphotericin or any component of the formulation

Allergy Considerations

- Amphotericin Derivative Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis: Has been reported with amphotericin B-containing drugs; facilities for cardiopulmonary resuscitation should be available during administration due to the possibility of anaphylactic reaction. If severe respiratory distress occurs, the infusion should be immediately discontinued; during the initial dosing, the drug should be administered under close clinical observation.

- Infusion reactions: Acute reactions (including fever and chills) may occur 1-3 hours after starting an intravenous infusion. These reactions are usually more common with the first few doses and generally diminish with subsequent doses.

Special populations:

- Neutropenic patients: Pulmonary reactions may occur in neutropenic patients receiving leukocyte transfusions; separation of the infusions as much as possible is advised.

Geriatric ConsiderationsThe pharmacokinetics and dosing of amphotericin have not been studied in elderly. It appears that use is similar to young adults; caution should be exercised and renal function and desired effect monitored closely.
Pregnancy Risk FactorB
LactationEnters breast milk/contraindicated
Breast-Feeding ConsiderationsDue to limited data, consider discontinuing nursing during therapy.
Adverse ReactionsNephrotoxicity and infusion-related hyperpyrexia, rigor, and chilling are reduced relative to amphotericin deoxycholate.

>10%:

Central nervous system: Chills, fever

Renal: Serum creatinine increased

Miscellaneous: Multiple organ failure

1% to 10%:

Cardiovascular: Hypotension, cardiac arrest

Central nervous system: Headache, pain

Dermatologic: Rash

Endocrine & metabolic: Bilirubinemia, hypokalemia, acidosis

Gastrointestinal: Nausea, vomiting, diarrhea, gastrointestinal hemorrhage, abdominal pain

Renal: Renal failure

Respiratory: Respiratory failure, dyspnea, pneumonia

Oncology: VesicantNo
Oncology: Emetic PotentialVery low (<10%)
Drug Interactions

Aminoglycosides: Amphotericin B may enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Colistimethate: Amphotericin B may enhance the nephrotoxic effect of Colistimethate. *Risk D: Consider therapy modification*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

CycloSPORINE: Amphotericin B may enhance the nephrotoxic effect of CycloSPORINE. *Risk C: Monitor therapy*

Gallium Nitrate: Amphotericin B may enhance the nephrotoxic effect of Gallium Nitrate. *Risk X: Avoid combination*

Saccharomyces boulardii: Antifungal Agents may diminish the therapeutic effect of Saccharomyces boulardii. *Risk D: Consider therapy modification*

Test InteractionsIncreased BUN (S), serum creatinine, alkaline phosphate, bilirubin; decreased magnesium, potassium (S)
Monitoring ParametersRenal function (monitor frequently during therapy), electrolytes (especially potassium and magnesium), liver function tests, temperature, PT/PTT, CBC; monitor input and output; monitor for signs of hypokalemia (muscle weakness, cramping, drowsiness, ECG changes, etc)
Nursing: Physical Assessment/MonitoringAssess culture and sensitivity report and patient's previous exposure to amphotericin B prior to starting therapy. Assess potential for interactions with other medications patient may be taking (eg, other nephrotoxic drugs). See Administration for specific infusion directions and premedication recommendations prior to administering first dose. Patient should be monitored closely for infusion related reactions (eg, anaphylaxis, chills, fever, nausea, vomiting, rigors, hypotension, acute respiratory distress) and cardiopulmonary resuscitation should be available. If acute respiratory distress occurs, infusion should be stopped and prescriber notified. Assess results of laboratory tests, therapeutic effectiveness, and adverse response frequently during therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.
Monitoring: Lab TestsBUN and serum creatinine levels should be determined every other day while therapy is increased and at least weekly thereafter. Monitor serum electrolytes (especially potassium and magnesium), liver function, and CBC. Perform culture and sensitivity testing prior to initiating therapy.
Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication can only be administered by infusion and therapy may last several weeks. Maintain good personal hygiene to reduce spread and recurrence of lesions. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause postural hypotension (use caution when changing from lying or sitting position to standing or when climbing stairs); or nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report chest pain or palpitations; CNS disturbances; skin rash; chills or fever; persistent nausea, vomiting, or abdominal pain; sore throat; excessive fatigue; swelling of extremities or unusual weight gain; respiratory difficulty; pain at

infusion site; muscle cramping or weakness; or other adverse reactions. **Breast-feeding precaution:** Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, suspension [preservative free]:

Abelcet®: 5 mg/mL (20 mL)

Generic AvailableNo

Mechanism of ActionBinds to ergosterol altering cell membrane permeability in susceptible fungi and causing leakage of cell components with subsequent cell death. Proposed mechanism suggests that amphotericin causes an oxidation-dependent stimulation of macrophages.

Pharmacodynamics/Kinetics

Distribution: V_d: Increases with higher doses; reflects increased uptake by tissues (131 L/kg with 5 mg/kg/day)

Half-life elimination: ~24 hours

Excretion: Clearance: Increases with higher doses (5 mg/kg/day): 400 mL/hour/kg

Related Information

- Amphotericin B (Conventional)

Pharmacotherapy PearlsAs a modification of dimyristoyl phosphatidylcholine:dimyristoyl phosphatidylglycerol 7:3 (DMPC:DMPG) liposome, amphotericin B lipid-complex has a higher drug to lipid ratio and the concentration of amphotericin B is 33 M. ABLC is a ribbon-like structure, not a liposome.

Controlled trials which compare the original formulation of amphotericin B to the newer liposomal formulations (ie, Abelcet®) are lacking. Thus, comparative data discussing differences among the formulations should be interpreted cautiously. Although the risk of nephrotoxicity and infusion-related adverse effects may be less with Abelcet®, the efficacy profiles of Abelcet® and the original amphotericin formulation are comparable. Consequently, Abelcet® should be restricted to those patients who cannot tolerate or fail a standard amphotericin B formulation.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation is common; may cause delirium

Mental Health: Effects on Psychiatric TreatmentMay cause bone marrow suppression; use caution with clozapine and carbamazepine

Anesthesia and Critical Care Concerns/Other ConsiderationsThis product is significantly more expensive than conventional amphotericin B. The incidence of nephrotoxicity with ABLC appears to be less when compared to conventional amphotericin B. The incidence of infusion-related reactions does not appear to be decreased with ABLC, but tolerance usually develops. Premedication may be considered to prevent/attenuate infusion-related adverse events. To prevent aggregation of the lipid products, it is important to shake the bag before hanging and once every 2 hours. *In vitro* experiments confirm that liposomal amphotericin B is at least as active as amphotericin B against clinical isolates of *Candida*, *Cryptococcus*, *Blastomyces*, and *Aspergillus*. Their activities also have appeared to be equal against *Fusarium*. Abelcet® may be restricted to patients who cannot tolerate or fail a standard amphotericin B formulation.

Medication Safety Issues

Safety issues:

Lipid-based amphotericin formulations (AmBisome®) may be confused with conventional formulations (Amphocin®, Fungizone®)

Large overdoses have occurred when conventional formulations were dispensed inadvertently for lipid-based products. Single daily doses of conventional amphotericin formulation never exceed 1.5 mg/kg.

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(am foe TER i sin bee lye po SO mal)
U.S. Brand NamesAmBisome®
Canadian Brand NamesAmBisome®
Pharmacologic Category[Antifungal Agent, Parenteral]()
Use: Labeled IndicationsEmpirical therapy for presumed fungal infection in febrile, neutropenic patients; treatment of patients with *Aspergillus* species, *Candida* species, and/or *Cryptococcus* species infections refractory to amphotericin B desoxycholate, or in patients where renal impairment or unacceptable toxicity precludes the use of amphotericin B desoxycholate; treatment of cryptococcal meningitis in HIV-infected patients; treatment of visceral leishmaniasis
Use: Unlabeled/InvestigationalEffective in patients with serious *Candida* species infections
Dosing: Adults**Note:Premedication:** For patients who experience nonanaphylactic infusion-related immediate reactions, premedicate with the following drugs 30-60 minutes prior to drug administration: A nonsteroidal anti-inflammatory agent ± diphenhydramine; **or** acetaminophen with diphenhydramine; **or** hydrocortisone 50-100 mg. If the patient experiences rigors during the infusion, meperidine may be administered.

Candidal infection:

Endocarditis: 3-6 mg/kg/day with flucytosine 25-37.5 mg/kg 4 times daily

Meningitis: 5 mg/kg/day with flucytosine 100 mg/kg/day

Cryptococcal meningitis (HIV-positive): 6 mg/kg/day

Note: IDSA guidelines (April, 2000) report doses of 3-6 mg/kg/day, noting that 4 mg/kg/day was effective in a small, open-label trial. The manufacturer's labeled dose of 6 mg/kg/day was approved in June, 2000.

Empiric therapy: 3 mg/kg/day

Fungal sinusitis: 5-7.5 mg/kg/day

Note: Use azole antifungal if causative organism is *Pseudallescheria boydii* (*Scedosporium* sp).

Systemic fungal infections *(Aspergillus, Candida, Cryptococcus)*: 3-5 mg/kg/day

Visceral leishmaniasis:

Immunocompetent: 3 mg/kg/day on days 1-5, and 3 mg/kg/day on days 14 and 21; a repeat course may be given in patients who do not achieve parasitic clearance

Note: Alternate regimen of 2 mg/kg/day for 5 days has been reportedly effective.

Immunocompromised: 4 mg/kg/day on days 1-5, and 4 mg/kg/day on days 10, 17, 24, 31, and 38

Dosing: ElderlyRefer to adult dosing.
Dosing: Pediatric**Note:Premedication:** For patients who experience nonanaphylactic infusion-related immediate reactions, premedicate with the following drugs 30-60 minutes prior to drug administration: A nonsteroidal anti-inflammatory agent ± diphenhydramine; **or** acetaminophen with diphenhydramine; **or** hydrocortisone 50-100 mg. If the patient experiences rigors during the infusion, meperidine may be administered.

Candidal infection: Children ≥1 month: I.V.: Refer to adult dosing.

Cryptococcal meningitis (HIV-positive): Children ≥1 month: I.V.: Refer to adult dosing.

Empiric therapy: Children ≥1 month: I.V.: Refer to adult dosing.

Systemic fungal infections *(Aspergillus, Candida, Cryptococcus)*: Children ≥1 month: I.V.: Refer to adult dosing.

Visceral leishmaniasis: Children ≥1 month: I.V.: Refer to adult dosing.

Dosing: Renal Impairment None necessary; effects of renal impairment are not currently known.

Hemodialysis: Supplemental dose is not necessary.

Peritoneal dialysis effects: Supplemental dose is not necessary.

Continuous renal replacement therapy (CRRT): No supplemental dosage necessary

Administration: I.V.Intravenous infusion, over a period of approximately 2 hours. Infusion time may be reduced to approximately 1 hour in patients in whom the treatment is well-tolerated. If the patient experiences discomfort during infusion, the duration of infusion may be increased. Discontinue if severe respiratory distress occurs.

For a patient who experiences chills, fever, hypotension, nausea, or other nonanaphylactic infusion-related reactions, premedicate with the following drugs, 30-60 minutes prior to drug administration: A nonsteroidal (eg, ibuprofen, choline magnesium trisalicylate) with or without diphenhydramine **or** acetaminophen with diphenhydramine **or** hydrocortisone 50-100 mg. If the patient experiences rigors during the infusion, meperidine may be administered.

Administration: I.V. DetailExisting intravenous line should be flushed with D$_5$W prior to infusion (if not feasible, administer through a separate line). An in-line membrane filter (not less than 1 micron) may be used.

StorageUnopened vials should be refrigerated at 2°C to 8°C (36°F to 46°F). Vials reconstituted with SWFI are stable for 24 hours under refrigeration. Infusion should begin within 6 hours of dilution with D5W.

ReconstitutionAdd 12 mL SWFI to vial. The use of any solution other than those recommended, or the presence of a bacteriostatic agent in the solution, may cause precipitation. **Shake the vial vigorously** for 30 seconds.

Filtration and dilution: The 5-micron filter should be on the syringe used to remove the reconstituted AmBisome®. Dilute to a final concentration of 1-2 mg/mL (0.2-0.5 mg/mL for infants and small children).

CompatibilityStable in D$_5$W; **incompatible** with NS, $^1/_2$NS, other saline-containing solutions, or preservatives.

ContraindicationsHypersensitivity to amphotericin B or any component of the formulation

Allergy Considerations

- Amphotericin Derivative Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis: Has been reported with amphotericin B-containing drugs; facilities for cardiopulmonary resuscitation should be available during administration due to the possibility of anaphylactic reaction. If severe respiratory distress occurs, the infusion should be immediately discontinued; during the initial dosing, the drug should be administered under close clinical observation.

- Infusion reactions: Acute reactions (including fever and chills) may occur 1-3 hours after starting infusions; reactions are more common with the first few doses and generally diminish with subsequent doses. Immediately discontinue infusion if severe respiratory distress occurs; the patient should not receive further infusions.

Special populations:

- Pediatrics: Safety and efficacy have not been established in patients <1 month of age.

Pregnancy Risk FactorB

LactationExcretion in breast milk unknown/contraindicated

Adverse ReactionsPercentage of adverse reactions is dependent upon population studied and may vary with respect to premedications and underlying illness. Incidence of decreased renal function and infusion-related events are lower than rates observed with amphotericin B deoxycholate.

>10%:

Cardiovascular: Peripheral edema (15%), edema (12% to 14%), tachycardia (9% to 18%), hypotension (7% to 14%), hypertension (8% to 20%), chest pain (8% to 12%), hypervolemia (8% to 12%)

Central nervous system: Chills (29% to 48%), insomnia (17% to 22%), headache (9% to 20%), anxiety (7% to 14%), pain (14%), confusion (9% to 13%)

Dermatologic: Rash (5% to 25%), pruritus (11%)

Endocrine & metabolic: Hypokalemia (31% to 51%), hypomagnesemia (15% to 50%), hyperglycemia (8% to 23%), hypocalcemia (5% to 18%), hyponatremia (8% to 12%)

Gastrointestinal: Nausea (16% to 40%), vomiting (10% to 32%), diarrhea (11% to 30%), abdominal pain (7% to 20%), constipation (15%), anorexia (10% to 14%)

Hematologic: Anemia (27% to 48%), blood transfusion reaction (9% to 18%), leukopenia (15% to 17%), thrombocytopenia (6% to 13%)

Hepatic: Alkaline phosphatase increased (7% to 22%), BUN increased (7% to 21%), bilirubinemia (9% to 18%), ALT (15%) increased, AST increased (13%), liver function tests abnormal (not specified) (4% to 13%)

Local: Phlebitis (9% to 11%)

Neuromuscular & skeletal: Weakness (6% to 13%), back pain (12%)

Renal: Creatinine increased (18% to 40%), hematuria (14%)

Respiratory: Dyspnea (18% to 23%), lung disorder (14% to 18%), cough increased (2% to 18%), epistaxis (8% to 15%), pleural effusion (12%), rhinitis (11%)

Miscellaneous: Sepsis (7% to 14%), infection (11% to 12%)

2% to 10%:

Cardiovascular: Arrhythmia, atrial fibrillation, bradycardia, cardiac arrest, cardiomegaly, facial swelling, flushing, postural hypotension, valvular heart disease, vascular disorder

Central nervous system: Agitation, abnormal thinking, coma, convulsion, depression, dysesthesia, dizziness (7% to 8%), hallucinations, malaise, nervousness, somnolence

Dermatologic: Alopecia, bruising, cellulitis, dry skin, maculopapular rash, petechia, purpura, skin discoloration, skin disorder, skin ulcer, urticaria, vesiculobullous rash

Endocrine & metabolic: Acidosis, fluid overload, hypernatremia (4%), hyperchloremia, hyperkalemia, hypermagnesemia, hyperphosphatemia, hypophosphatemia, hypoproteinemia, lactate dehydrogenase increased, nonprotein nitrogen increased

Gastrointestinal: Constipation, dry mouth, dyspepsia, abdomen enlarged, amylase increased, eructation, fecal incontinence, flatulence, gastrointestinal hemorrhage (10%), hematemesis, hemorrhoids, gum/oral hemorrhage, ileus, mucositis, rectal disorder, stomatitis, ulcerative stomatitis

Genitourinary: Vaginal hemorrhage

Hematologic: Coagulation disorder, hemorrhage, prothrombin decreased, thrombocytopenia

Hepatic: Hepatocellular damage, hepatomegaly, veno-occlusive liver disease

Local: Injection site inflammation

Neuromuscular & skeletal: Arthralgia, bone pain, dystonia, myalgia, neck pain, paresthesia, rigors, tremor

Ocular: Conjunctivitis, dry eyes, eye hemorrhage

Renal: Abnormal renal function, acute kidney failure, dysuria, kidney failure, toxic nephropathy, urinary incontinence

Respiratory: Asthma, atelectasis, cough, dry nose, hemoptysis, hyperventilation, lung edema, pharyngitis, pneumonia, respiratory alkalosis, respiratory insufficiency, respiratory failure, sinusitis, hypoxia (6% to 8%)

Miscellaneous: Allergic reaction, cell-mediated immunological reaction, flu-like syndrome, graft-versus-host disease, herpes simplex, hiccup, procedural complication (8% to 10%), diaphoresis (7%)

Postmarketing and/or case reports: Angioedema, erythema, urticaria, cyanosis/hypoventilation, pulmonary edema, agranulocytosis, hemorrhagic cystitis

Drug Interactions

Aminoglycosides: Amphotericin B may enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Colistimethate: Amphotericin B may enhance the nephrotoxic effect of Colistimethate. *Risk D: Consider therapy modification*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

CycloSPORINE: Amphotericin B may enhance the nephrotoxic effect of CycloSPORINE. *Risk C: Monitor therapy*

Gallium Nitrate: Amphotericin B may enhance the nephrotoxic effect of Gallium Nitrate. *Risk X: Avoid combination*

Saccharomyces boulardii: Antifungal Agents may diminish the therapeutic effect of Saccharomyces boulardii. *Risk D: Consider therapy modification*

Monitoring ParametersRenal function (monitor frequently during therapy), electrolytes (especially potassium and magnesium), liver function tests, temperature, PT/PTT, CBC; monitor input and output; monitor for signs of hypokalemia (muscle weakness, cramping, drowsiness, ECG changes, etc)

Nursing: Physical Assessment/MonitoringAssess culture and sensitivity report and patient's previous exposure to amphotericin B prior to starting therapy. Assess potential for interactions with other medications patient may be taking (eg, other nephrotoxic drugs). See Administration for specific infusion directions and premedication recommendations prior to administering first dose. Patient should be monitored closely for infusion related reactions (eg, anaphylaxis, chills, fever, nausea, vomiting, rigors, hypotension, acute respiratory distress) and cardiopulmonary resuscitation should be available. If acute respiratory distress occurs, infusion should be stopped and prescriber notified. Assess results of laboratory tests, therapeutic effectiveness, and adverse response frequently during therapy. Teach patient possible side effects/appropriate interventions, and adverse symptoms to report.

Monitoring: Lab TestsBUN and serum creatinine levels should be determined every other day while therapy is increased and at least weekly thereafter. Serum potassium and magnesium should be monitored closely. Monitor electrolytes, liver function, hematocrit, and CBC regularly.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication can only be administered by infusion and therapy may last several weeks. You will be monitored closely during and after infusion; report immediately any pain or swelling at infusion site, chills, nausea, chest pain, swelling of face or mouth, difficulty breathing, muscle cramping, acute anxiety, or other infusion reactions. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause postural hypotension (use caution when changing from lying or sitting position to standing or when climbing stairs); or nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report chest pain or palpitations, CNS disturbances, skin rash, unusual chills or fever, persistent nausea, vomiting, abdominal pain, sore throat, excessive fatigue, swelling of extremities, unusual weight gain, difficulty breathing, pain at infusion site, muscle cramping or weakness, or other adverse reactions. **Breast-feeding precaution:** Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

AmBisome®: 50 mg [contains soy and sucrose]

Generic AvailableNo

Mechanism of ActionBinds to ergosterol altering cell membrane permeability in susceptible fungi and causing leakage of cell components with subsequent cell death. Proposed mechanism suggests that amphotericin causes an oxidation-dependent stimulation of macrophages (Lyman, 1992).

Pharmacodynamics/Kinetics

Distribution: V_d: 131 L/kg

Half-life elimination: Terminal: 174 hours

Pharmacotherapy PearlsAmphotericin B (liposomal) is a true single bilayer liposomal drug delivery system. Liposomes are closed, spherical vesicles created by mixing specific proportions of amphophilic substances such as phospholipids and cholesterol so that they arrange themselves into multiple concentric bilayer membranes when hydrated in aqueous solutions. Single bilayer liposomes are then formed by microemulsification of multilamellar vesicles using a homogenizer. Amphotericin B (liposomal) consists of these unilamellar bilayer liposomes with amphotericin B intercalated within the membrane. Due to the nature and quantity of amphophilic substances used, and the lipophilic moiety in the amphotericin B molecule, the drug is an integral part of the overall structure of the amphotericin B liposomal liposomes. Amphotericin B (liposomal) contains true liposomes that are <100 nm in diameter.

Dental Health Professional ConsiderationsAmphotericin B, liposomal is a true single bilayer liposomal drug delivery system. Liposomes are closed, spherical vesicles created by mixing specific proportions of amphophilic substances such as phospholipids and cholesterol so that they arrange themselves into multiple concentric bilayer membranes when hydrated in aqueous solutions. Single bilayer liposomes are then formed by microemulsification of multilamellar vesicles using a homogenizer. Amphotericin B, liposomal consists of these unilamellar bilayer liposomes with amphotericin B intercalated within the membrane. Due to the nature and quantity of amphophilic substances used, and the lipophilic moiety in the amphotericin B molecule, the drug is an integral part of the overall structure of the amphotericin B liposomes. Amphotericin B, liposomal contains true liposomes that are <100 nm in diameter.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Facial swelling, postural hypotension, mucositis, stomatitis, and ulcerative stomatitis (see Dental Comment)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusSedation is common; may cause delirium

Mental Health: Effects on Psychiatric TreatmentMay cause bone marrow suppression; use caution with clozapine and carbamazepine

Anesthesia and Critical Care Concerns/Other ConsiderationsThis product is significantly more expensive than conventional amphotericin B; Infectious Disease consult is recommended. AmBisome® is a true single bilayer liposomal drug delivery system. Liposomes are closed, spherical vesicles created by mixing specific proportions of amphophilic substances such as phospholipids and cholesterol so that they arrange themselves into multiple concentric bilayer membranes when hydrated in aqueous solutions. Single bilayer liposomes are then formed by microemulsification of multilamellar vesicles using a homogenizer. AmBisome® consists of these unilamellar bilayer liposomes with amphotericin B intercalated within the membrane. Due to the nature and quantity of amphophilic substances used, and the lipophilic moiety in the amphotericin B molecule, the drug is an integral part of the overall structure of the AmBisome® liposomes. AmBisome® contains true liposomes that are <100 nm in diameter.

Medication Safety Issues

Safety issues:

Lipid-based amphotericin formulations (Amphotec®) may be confused with conventional formulations (Amphocin®, Fungizone®)

Large overdoses have occurred when conventional formulations were dispensed inadvertently for lipid-based products. Single daily doses of conventional amphotericin formulation never exceed 1.5 mg/kg.

High alert medication: The Institute for Safe Medication Practices (ISMP) includes this medication among its list of drugs which have a heightened risk of causing significant patient harm when used in error.

Pronunciation(am foe TER i sin bee kole LES te ril SUL fate KOM plecks)

U.S. Brand NamesAmphotec®

Canadian Brand NamesAmphotec®

Pharmacologic CategoryAntifungal Agent, Parenteral

Use: Labeled IndicationsTreatment of invasive aspergillosis in patients who have failed amphotericin B deoxycholate treatment, or who have renal impairment or experience unacceptable toxicity which precludes treatment with amphotericin B deoxycholate in effective doses.

Use: Unlabeled/InvestigationalEffective in patients with serious *Candida* species infections

Dosing: Adults

Note: Premedication: For patients who experience chills, fever, hypotension, nausea, or other nonanaphylactic infusion-related immediate reactions, premedicate with the following drugs 30-60 minutes prior to drug administration: A nonsteroidal (eg, ibuprofen, choline magnesium trisalicylate) with or without diphenhydramine **or** acetaminophen with diphenhydramine **or** hydrocortisone 50-100 mg. If the patient experiences rigors during the infusion, meperidine may be administered.

Usual dosage: I.V.: 3-4 mg/kg/day (infusion of 1 mg/kg/hour); maximum: 7.5 mg/kg/day

A regimen of 6 mg/kg/day has been used for treatment of life-threatening invasive mold infections in immunocompromised patients; maximum: 7.5 mg/kg/day.

Initially infuse at 1 mg/kg/hour. Rate of infusion may be increased with subsequent doses to 3 mg/kg/hour as patient tolerance allows. Treatment should continue as patient tolerance allows, until complete resolution of microbiologic and clinical evidence of fungal disease.

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

Administration: I.V.For a patient who experiences chills, fever, hypotension, nausea, or other nonanaphylactic infusion-related reactions, premedicate with the following drugs 30-60 minutes prior to drug administration: A nonsteroidal (eg, ibuprofen, choline magnesium trisalicylate) with or without diphenhydramine **or** acetaminophen with diphenhydramine **or** hydrocortisone 50-100 mg. If the patient experiences rigors during the infusion, meperidine may be administered. If severe respiratory distress occurs, the infusion should be immediately discontinued.

Administration: I.V. DetailAvoid injection faster than 1 mg/kg/hour.

StorageStore intact vials under refrigeration. After reconstitution, the solution should be refrigerated at 2°C to 8°C (36°F to 46°F) and used within 24 hours. Concentrations of 0.1-2 mg/mL in dextrose 5% in water are stable for 14 days at 4°C and 23°C if protected from light, however, due to the occasional formation of subvisual particles, solutions should be used within 48 hours.

ReconstitutionReconstitute 50 mg and 100 mg vials with 10 mL and 20 mL of SWI, respectively. The reconstituted vials contain 5 mg/mL of amphotericin B. Shake the vial gently by hand until all solid particles have dissolved. Further dilute amphotericin B colloidal dispersion with dextrose 5% in water.

CompatibilityStable in D_5W; **incompatible** with NS.

Y-site administration: Compatible: Acyclovir, aminophylline, cefoxitin, ceftizoxime, clindamycin, dexamethasone sodium phosphate, fentanyl, furosemide, ganciclovir, granisetron, hydrocortisone sodium succinate, ifosfamide, lorazepam, mannitol, methotrexate, methylprednisolone sodium succinate, nitroglycerin, sufentanil, trimethoprim/sulfamethoxazole, vinblastine, vincristine, zidovudine. **Incompatible:** Alfentanil, amikacin, ampicillin, ampicillin/sulbactam, atenolol, aztreonam, bretylium, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, cefazolin, cefepime, cefoperazone, ceftazidime, ceftriaxone, chlorpromazine, cimetidine, cisatracurium, cisplatin, cyclophosphamide, cyclosporine, cytarabine, diazepam, digoxin, diphenhydramine, dobutamine, dopamine, doxorubicin, doxorubicin liposome, droperidol, enalaprilat, esmolol, famotidine, fluconazole, fluorouracil, gatifloxacin, gentamicin, haloperidol, heparin, hydromorphone, hydroxyzine, imipenem/cilastatin, labetalol, leucovorin, lidocaine, magnesium sulfate, meperidine, mesna, metoclopramide, metoprolol, metronidazole, midazolam, mitoxantrone, morphine, nalbuphine, naloxone, ofloxacin, ondansetron, paclitaxel, pentobarbital, phenobarbital, phenytoin, piperacillin, piperacillin/tazobactam, potassium chloride, prochlorperazine, promethazine, propranolol, ranitidine, remifentanil, sodium bicarbonate, ticarcillin, ticarcillin/clavulanate, tobramycin, vancomycin, vecuronium, verapamil, vinorelbine.

ContraindicationsHypersensitivity to amphotericin B or any component of the formulation

Allergy Considerations

- Amphotericin Derivative Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis: Has been reported with amphotericin B-containing drugs; facilities for cardiopulmonary resuscitation should be available during administration due to the possibility of anaphylactic reaction. If severe respiratory distress occurs, the infusion should be immediately discontinued. During the initial dosing, the drug should be administered under close clinical observation.

- Infusion reactions: Sometimes severe, usually subside with continued therapy - manage with decreased rate of infusion and pretreatment with antihistamines/corticosteroids.

Special populations:

- Neutropenic patients: Pulmonary reactions may occur in neutropenic patients receiving leukocyte transfusions; separation of the infusions as much as possible is advised.

Geriatric ConsiderationsThe pharmacokinetics and dosing of amphotericin have not been studied in the elderly. It appears that use is similar to young adults. Caution should be exercised and renal function and desired effect monitored closely.

Pregnancy Risk FactorB

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsDue to limited data, consider discontinuing nursing during therapy.

Adverse Reactions

>10%: Central nervous system: Chills, fever

1% to 10%:

Cardiovascular: Hypotension, tachycardia

Central nervous system: Headache

Dermatologic: Rash

Endocrine & metabolic: Hypokalemia, hypomagnesemia

Gastrointestinal: Nausea, diarrhea, abdominal pain

Hematologic: Thrombocytopenia

Hepatic: LFT change

Neuromuscular & skeletal: Rigors

Renal: Creatinine increased

Respiratory: Dyspnea

Note: Amphotericin B colloidal dispersion has an improved therapeutic index compared to conventional amphotericin B, and has been used safely in patients with amphotericin B-related nephrotoxicity; however, continued decline of renal function has occurred in some patients.

Drug Interactions

Aminoglycosides: Amphotericin B may enhance the nephrotoxic effect of Aminoglycosides. *Risk C: Monitor therapy*

Colistimethate: Amphotericin B may enhance the nephrotoxic effect of Colistimethate. *Risk D: Consider therapy modification*

Corticosteroids (Orally Inhaled): May enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

Corticosteroids (Systemic): May enhance the hypokalemic effect of Amphotericin B. *Risk C: Monitor therapy*

CycloSPORINE: Amphotericin B may enhance the nephrotoxic effect of CycloSPORINE. *Risk C: Monitor therapy*

Gallium Nitrate: Amphotericin B may enhance the nephrotoxic effect of Gallium Nitrate. *Risk X: Avoid combination*

Saccharomyces boulardii: Antifungal Agents may diminish the therapeutic effect of Saccharomyces boulardii. *Risk D: Consider therapy modification*

Monitoring ParametersLiver function tests, electrolytes, BUN, Cr, temperature, CBC, I/O, signs of hypokalemia (muscle weakness, cramping, drowsiness, ECG changes)

Nursing: Physical Assessment/MonitoringAssess culture and sensitivity report and patient's previous exposure to amphotericin B prior to starting therapy. Assess potential for interactions with other medications patient may be taking (eg, other nephrotoxic drugs). See Administration for specific infusion directions and premedication recommendations prior to administering first dose. Patient should be monitored closely for infusion related reactions (eg, anaphylaxis, chills, fever, nausea, vomiting, rigors, hypotension, acute respiratory distress) and cardiopulmonary resuscitation should be available. If acute respiratory distress occurs, infusion should be stopped and prescriber notified. Assess results of laboratory tests, therapeutic effectiveness, and adverse response (see Adverse Reactions) frequently during therapy. Teach patient possible side effects/appropriate interventions and adverse symptoms to report.

Monitoring: Lab TestsMonitor serum electrolytes (especially potassium and magnesium), liver function, and CBC. Perform culture and sensitivity testing prior to initiating therapy.

Patient EducationDo not take any new medication during therapy unless approved by prescriber. This medication can only be administered by infusion and therapy may last several weeks. You will be monitored closely during and after infusion; report immediately any pain or swelling at infusion site, chills, nausea, chest pain, swelling of face or mouth, difficulty breathing, muscle cramping, acute anxiety, or other infusion reactions. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause postural hypotension (use caution when changing from lying or sitting position to standing or when climbing stairs); or nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help). Report chest pain or palpitations; CNS disturbances; skin rash; unusual chills or fever; persistent nausea, vomiting, or abdominal pain; sore throat; excessive fatigue; swelling of extremities or unusual weight gain; difficulty breathing; pain at infusion site; muscle cramping or weakness; or other adverse reactions. **Breast-feeding precaution:** Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Amphotec®: 50 mg, 100 mg

Generic AvailableNo

Mechanism of ActionBinds to ergosterol altering cell membrane permeability in susceptible fungi and causing leakage of cell components with subsequent cell death. Proposed mechanism suggests that amphotericin causes an oxidation-dependent stimulation of macrophages (Lyman, 1992).

Pharmacodynamics/Kinetics

Distribution: V_d: Total volume increases with higher doses, reflects increasing uptake by tissues (with 4 mg/kg/day = 4 L/kg); predominantly distributed in the liver; concentrations in kidneys and other tissues are lower than observed with conventional amphotericin B

Half-life elimination: 28-29 hours; prolonged with higher doses

Pharmacotherapy PearlsControlled trials which compare the original formulation of amphotericin B to the newer liposomal formulations (ie, Amphotec®) are lacking. Thus, comparative data discussing differences among the formulations should be interpreted cautiously. Although the risk of nephrotoxicity and infusion-related adverse effects may be less with Amphotec®, the efficacy profiles of Amphotec® and the original amphotericin formulation are comparable. Consequently, Amphotec® should be restricted to those patients who cannot tolerate or fail a standard amphotericin B formulation.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay cause bone marrow suppression; use caution with clozapine and carbamazepine

Anesthesia and Critical Care Concerns/Other ConsiderationsPatients may be premedicated with acetaminophen and diphenhydramine 30 minutes prior to infusion. Meperidine (Demerol®) may help reduce rigors.

Controlled trials which compare the original formulation of amphotericin B to the newer liposomal formulations (ie, Amphotec®) are lacking. Thus, comparative data discussing differences among the formulations should be interpreted cautiously. Although the risk of nephrotoxicity and infusion-related adverse effects may be less with Amphotec®, the efficacy profiles of Amphotec® and the original amphotericin formulation are comparable. Consequently, Amphotec® should be restricted to those patients who cannot tolerate or who fail a standard amphotericin B formulation. This product is significantly more expensive than conventional amphotericin B; Infectious Disease consult is recommended.

Ampicillin and Sulbactam

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(am pi SIL in & SUL bak tam)

U.S. Brand NamesUnasyn®

Canadian Brand NamesUnasyn®

Pharmacologic CategoryAntibiotic, Penicillin

Use: Labeled IndicationsTreatment of susceptible bacterial infections involved with skin and skin structure, intra-abdominal infections, gynecological infections; spectrum is that of ampicillin plus organisms producing beta-lactamases such as *S. aureus*, *H. influenzae*, *E. coli*, *Klebsiella*, *Acinetobacter*, *Enterobacter*, and anaerobes

Use: DentalParenteral beta-lactamase-resistant antibiotic combination to treat more severe orofacial infections where beta-lactamase-producing staphylococci and beta-lactamase-producing *Bacteroides* are present

Dosing: AdultsDoses expressed as ampicillin/sulbactam combination.

Susceptible infections: I.M., I.V.: 1.5-3 g every 6 hours (maximum: Unasyn® 12 g)

Amnionitis, cholangitis, diverticulitis, endometritis, endophthalmitis, epididymitis/orchitis, liver abscess, osteomyelitis (diabetic foot), peritonitis: I.V.: 3 g every 6 hours

Endocarditis: I.V.: 3 g every 6 hours with gentamicin or vancomycin for 4-6 weeks

Orbital cellulitis: I.V.: 1.5 g every 6 hours

Parapharyngeal space infections: I.V.: 3 g every 6 hours

***Pasteurella multocida*(human, canine/feline bites):** I.V.: 1.5-3 g every 6 hours

Pelvic inflammatory disease: I.V.: 3 g every 6 hours with doxycycline

Peritonitis (CAPD): Intraperitoneal:

Anuric, intermittent: 3 g every 12 hours

Anuric, continuous: Loading dose: 1.5 g; maintenance dose: 150 mg

Pneumonia:

Aspiration, community-acquired: I.V.: 1.5-3 g every 6 hours

Hospital-acquired: I.V.: 3 g every 6 hours

Urinary tract infections, pyelonephritis: I.V.: 3 g every 6 hours for 14 days

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Epiglottitis: Children ≥1 year: I.V.: 100-200 mg ampicillin/kg/day divided in 4 doses

Mild-to-moderate infections: Children ≥1 year: I.V.: 100-200 mg ampicillin/kg/day (150-300 mg Unasyn®) divided every 6 hours (maximum: 8 g ampicillin/day, 12 g Unasyn®)

Peritonsillar and retropharyngeal abscess: Children ≥1 year: I.V.: 50 mg ampicillin/kg/dose every 6 hours

Severe infections: Children ≥1 year: I.M., I.V.: 200-400 mg ampicillin/kg/day divided every 6 hours (maximum: 8 g ampicillin/day, 12 g Unasyn®)

Note: The American Academy of Pediatrics recommends a dose of up to 300 mg/kg/day for severe infection in infants >1 month of age.

Dosing: Renal Impairment

Cl_{cr} 15-29 mL/minute: Administer every 12 hours

Cl_{cr} 5-14 mL/minute: Administer every 24 hours

Continuous ambulatory peritoneal dialysis (CAPD): 3 g every 24 hours

Continuous renal replacement therapy (CRRT): Drug clearance is highly dependent on the method of renal replacement, filter type, and flow rate. Appropriate dosing requires close monitoring of pharmacologic response, signs of adverse reactions due to drug accumulation, as well as drug levels in relation to target trough (if appropriate). The following are general recommendations only (based on dialysate flow/ultrafiltration rates of 1 L/hour) and should not supersede clinical judgment:

CVVH: 3 g every 12 hours

CVVHD/CVVHDF: 3 g every 8 hours

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Administer around-the-clock to promote less variation in peak and trough serum levels. Administer by slow injection over 10-15 minutes or I.V. over 15-30 minutes. Ampicillin and gentamicin should not be mixed in the same I.V. tubing.

Some penicillins (eg, carbenicillin, ticarcillin, and piperacillin) have been shown to inactivate aminoglycosides *in vitro*. This has been observed to a greater extent with tobramycin and gentamicin, while amikacin has shown greater stability against inactivation. Concurrent use of these agents may pose a risk of reduced antibacterial efficacy *in vivo*, particularly in the setting of profound renal impairment. However, definitive clinical evidence is lacking. If combination penicillin/aminoglycoside therapy is desired in a patient with renal dysfunction, separation of doses (if feasible), and routine monitoring of aminoglycoside levels, CBC, and clinical response should be considered.

Administration: I.V. DetailpH: 8-10

Dietary ConsiderationsSodium content of 1.5 g injection: 115 mg (5 mEq)

StoragePrior to reconstitution, store at ≤30°C (86°F). Solutions made in NS are stable up to 72 hours when refrigerated whereas dextrose solutions (same concentration) are stable for only 4 hours.

ReconstitutionI.M. and direct I.V. administration: Use within 1 hour after preparation. Reconstitute with sterile water for injection or 0.5% or 2% lidocaine hydrochloride injection (I.M.). Sodium chloride 0.9% (NS) is the diluent of choice for I.V. piggyback use.

CompatibilityStable in NS; **variable stability (consult detailed reference)** in $D_5{}^1/_2NS$, D_5W, LR.

Y-site administration: Compatible: Amifostine, aztreonam, cefepime, docetaxel, enalaprilat, etoposide, famotidine, filgrastim, fluconazole, fludarabine, gatifloxacin, gemcitabine, granisetron, heparin, insulin (regular), linezolid, meperidine, morphine, paclitaxel, remifentanil, tacrolimus, teniposide, theophylline, thiotepa. **Incompatible:** Aminoglycosides (gentamicin, tobramycin), amphotericin B cholesteryl sulfate complex, ciprofloxacin, idarubicin, ondansetron, sargramostim. **Variable (consult detailed reference):** Cisatracurium, diltiazem, vancomycin.

Compatibility when admixed: Compatible: Aztreonam. **Incompatible:** Aminoglycosides.

ContraindicationsHypersensitivity to ampicillin, sulbactam, penicillins, or any component of the formulations

Allergy Considerations

- Penicillin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Serious and occasionally severe or fatal hypersensitivity (anaphylactoid) reactions have been reported in patients on penicillin therapy, especially with a history of beta-lactam hypersensitivity, history of sensitivity to multiple allergens, or previous IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria). Use with caution in asthmatic patients.

- Rash: Appearance of a rash should be carefully evaluated to differentiate a nonallergic ampicillin rash from a hypersensitivity reaction; rash occurs in 5% to 10% of children and is a generalized dull red, maculopapular rash, generally appearing 3-14 days after the start of therapy. It normally begins on the trunk and spreads over most of the body. It may be most intense at pressure areas, elbows, and knees.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Infectious mononucleosis: A high percentage of patients with infectious mononucleosis have developed rash during therapy; ampicillin-class antibiotics not recommended in these patients.

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment recommended.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children <1 year of age.

Geriatric ConsiderationsAdjust dose for renal function.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events have not been observed in animal studies; therefore, ampicillin/sulbactam is classified as pregnancy category B. Both ampicillin and sulbactam cross the placenta. When used during pregnancy, pharmacokinetic changes have been observed with ampicillin alone (refer to the Ampicillin monograph for details).

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsAmpicillin and sulbactam are both excreted into breast milk in low concentrations. The manufacturer recommends that caution be used if administering to lactating women. Nondose-related effects could include modification of bowel flora and allergic sensitization of the infant. The maternal dose of sulbactam does not need altered in the postpartum period. Also refer to the Ampicillin monograph.

Pregnancy & Lactation, In-Depth

- Ampicillin and Sulbactam in Pregnancy & Lactation

Adverse ReactionsAlso see Ampicillin.

>10%: Local: Pain at injection site (I.M.)

1% to 10%:

Dermatologic: Rash

Gastrointestinal: Diarrhea

Local: Pain at injection site (I.V.), thrombophlebitis

Miscellaneous: Allergic reaction (may include serum sickness, urticaria, bronchospasm, hypotension, etc)

<1%: Abdominal distension, candidiasis, chest pain, chills, dysuria, edema, epistaxis, erythema, facial swelling, fatigue, flatulence, glossitis, hairy tongue, headache, interstitial nephritis, itching, liver enzymes increased, malaise, mucosal bleeding, nausea, pseudomembranous colitis, seizure, substernal pain, throat tightness, thrombocytopenia, urine retention, vomiting

Drug Interactions

Allopurinol: May enhance the potential for allergic or hypersensitivity reactions to Ampicillin. *Risk C: Monitor therapy*

Atenolol: Ampicillin may decrease the bioavailability of Atenolol. *Risk C: Monitor therapy*

Fusidic Acid: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Methotrexate: Penicillins may decrease the excretion of Methotrexate. *Risk C: Monitor therapy*

Tetracycline Derivatives: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Penicillins. *Risk C: Monitor therapy*

Test InteractionsMay interfere with urinary glucose tests using cupric sulfate (Benedict's solution, Clinitest®).

Some penicillin derivatives may accelerate the degradation of aminoglycosides *in vitro*, leading to a potential underestimation of aminoglycoside serum concentration.

Monitoring ParametersWith prolonged therapy, monitor hematologic, renal, and hepatic function; monitor for signs of anaphylaxis during first dose

Nursing: Physical Assessment/MonitoringSee individual agent for Ampicillin.

Monitoring: Lab TestsHematologic, renal, and hepatic function with prolonged therapy. Perform culture and sensitivity testing prior to initiating therapy.

Patient EducationSee individual agent for Ampicillin.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 1.5 g: Ampicillin 1 g and sulbactam 0.5 g [contains sodium 115 mg (5 mEq)/1.5 g)]; 3 g: Ampicillin 2 g and sulbactam 1 g [contains sodium 115 mg (5 mEq)/1.5 g)]; 15 g: Ampicillin 10 g and sulbactam 5 g [bulk package; contains sodium 115 mg (5 mEq)/1.5 g]

Unasyn®:

1.5 g: Ampicillin 1 g and sulbactam 0.5 g [contains sodium 115 mg (5 mEq)/1.5 g)]

3 g: Ampicillin 2 g and sulbactam 1 g [contains sodium 115 mg (5 mEq)/1.5 g)]

15 g: Ampicillin 10 g and sulbactam 5 g [bulk package; contains sodium 115 mg (5 mEq)/1.5 g)]

Generic AvailableYes

ManufacturerPfizer U.S. Pharmaceuticals Group

Mechanism of ActionThe addition of sulbactam, a beta-lactamase inhibitor, to ampicillin extends the spectrum of ampicillin to include some beta-lactamase-producing organisms; inhibits bacterial cell wall synthesis by binding to one or more of the penicillin-binding proteins (PBPs) which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.

Pharmacodynamics/Kinetics

Ampicillin: See Ampicillin.

Sulbactam:

Distribution: Bile, blister, and tissue fluids

Protein binding: 38%

Half-life elimination: Normal renal function: 1-1.3 hours

Excretion: Urine (~75% to 85% as unchanged drug) within 8 hours

Related Information

- Ampicillin
- Antimicrobial Drugs of Choice
- Treatment of Sexually-Transmitted Infections

Dental Health Professional ConsiderationsIn maxillary sinus, anterior nasal cavity, and deep neck infections, beta-lactamase-producing staphylococci and beta-lactamase-producing *Bacteroides* usually are present. In these situations, antibiotics that resist the beta-lactamase enzyme should be administered. Amoxicillin and clavulanic acid is administered orally for moderate infections. Ampicillin sodium and sulbactam sodium (Unasyn®) is administered parenterally for more severe infections.

Dental Health: Effects on Dental TreatmentProlonged use of penicillins may lead to development of oral candidiasis (see Dental Comment)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusLarge I.V. doses may rarely produce encephalopathy; penicillins have been reported to cause apprehension, illusions, agitation, insomnia, depersonalization, and encephalopathy

Mental Health: Effects on Psychiatric TreatmentRarely may cause bone marrow suppression; use caution with clozapine and carbamazepine

Medication Safety Issues

Sound-alike/look-alike issues:

Ampicillin may be confused with aminophylline

Pronunciation(am pi SIL in)
Canadian Brand NamesApo-Ampi®; Novo-Ampicillin; Nu-Ampi
Pharmacologic CategoryAntibiotic, Penicillin
Use: Labeled IndicationsTreatment of susceptible bacterial infections (nonbeta-lactamase-producing organisms); treatment or prophylaxis of infective endocarditis; susceptible bacterial infections caused by streptococci, pneumococci, nonpenicillinase-producing staphylococci, *Listeria*, meningococci; some strains of *H. influenzae*, *Salmonella*, *Shigella*, *E. coli*, *Enterobacter*, and *Klebsiella*
Use: DentalI.V. or I.M. administration for the prevention of infective endocarditis in patients not allergic to penicillin and unable to take oral amoxicillin; I.V. or I.M. administration for prophylaxis in total joint replacement patients not allergic to penicillin and unable to take oral medications undergoing dental procedures which produce bacteremia
Dosing: Adults

Usual dosage range:

Oral: 250-500 mg every 6 hours

I.M., I.V.: 250-500 mg every 6 hours

Actinomycosis: I.V.: 50 mg/kg/day for 4-6 weeks then oral amoxicillin

Cholangitis (acute): I.V.: 2 g every 4 hours with gentamicin

Diverticulitis: I.M., I.V.: 2 g every 6 hours with metronidazole

Endocarditis:

Infective: I.V.: 12 g/day via continuous infusion or divided every 4 hours

Prophylaxis: Dental, oral, or respiratory tract procedures: I.M., I.V.: 2 g within 30-60 minutes prior to procedure in patients not allergic to penicillin and unable to take oral amoxicillin. Intramuscular injections should be avoided in patients who are receiving anticoagulant therapy. In these circumstances, orally administered regimens should be given whenever possible. Intravenously administered antibiotics should be used for patients who are unable to tolerate or absorb oral medications. **Note:** American Heart Association (AHA) guidelines now recommend prophylaxis only in patients undergoing invasive procedures and in whom underlying cardiac conditions may predispose to a higher risk of adverse outcomes should infection occur.

Prophylaxis in total joint replacement patient: I.M., I.V.: 2 g 1 hour prior to the procedure

Genitourinary and gastrointestinal tract procedures: I.M., I.V.:

High-risk patients: 2 g within 30 minutes prior to procedure, followed by ampicillin 1 g (or amoxicillin 1g orally) 6 hours later; must be used in combination with gentamicin. **Note:** As of April 2007, routine prophylaxis for GI/GU procedures is no longer recommended by the AHA.

Moderate-risk patients: 2 g within 30 minutes prior to procedure

Group B strep prophylaxis (intrapartum): I.V.: 2 g initial dose, then 1 g every 4 hours until delivery

***Listeria*infections:** I.V.: 200 mg/kg/day divided every 6 hours

Sepsis/meningitis: I.M., I.V.: 150-250 mg/kg/day divided every 3-4 hours (range: 6-12 g/day)

Urinary tract infections (enterococcus suspected): I.V.: 1-2 g every 6 hours with gentamicin

Dosing: ElderlyAdminister usual adult dose unless renal function is markedly reduced.
Dosing: Pediatric

Endocarditis prophylaxis: Infants and Children: I.M., I.V.:

Dental, oral, or respiratory tract procedures: 50 mg/kg within 30-60 minutes prior to procedure in patients not allergic to penicillin and unable to take oral amoxicillin. Intramuscular injections should be avoided in patients who are receiving anticoagulant therapy. In these circumstances, orally administered regimens should be given whenever possible. Intravenously administered antibiotics should be used for patients who are unable to tolerate or absorb oral medications.

Note: American Heart Association (AHA) guidelines now recommend prophylaxis only in patients undergoing invasive procedures and in whom underlying cardiac conditions may predispose to a higher risk of adverse outcomes should infection occur.

Genitourinary and gastrointestinal tract procedures:

High-risk patients: 50 mg/kg (maximum: 2 g) within 30 minutes prior to procedure, followed by ampicillin 25 mg/kg (or amoxicillin 25 mg/kg orally) 6 hours later; must be used in combination with gentamicin. **Note:** As of April 2007, routine prophylaxis for GI/GU procedures is no longer recommended by the AHA.

Moderate-risk patients: 50 mg/kg within 30 minutes prior to procedure.

Mild-to-moderate infections: Infants and Children:

Oral: 50-100 mg/kg/day in doses divided every 6 hours (maximum: 2-4 g/day)

I.M., I.V.: 100-150 mg/kg/day in divided doses every 6 hours (maximum: 2-4 g/day)

Severe infections/meningitis: Infants and Children: I.M., I.V.: 200-400 mg/kg/day in divided doses every 6 hours (maximum: 6-12 g/day)

Dosing: Renal Impairment

Cl_{cr} >50 mL/minute: Administer every 6 hours

Cl_{cr} 10-50 mL/minute: Administer every 6-12 hours

Cl_{cr} <10 mL/minute: Administer every 12-24 hours

Hemodialysis: Moderately dialyzable (20% to 50%); administer dose after dialysis

Peritoneal dialysis: Moderately dialyzable (20% to 50%)

Administer 250 mg every 12 hours

Continuous arteriovenous or venovenous hemofiltration effects: Dose as for Cl_{cr} 10-50 mL/minute; ~50 mg of ampicillin per liter of filtrate is removed

Calculations

- Creatinine Clearance: Adults
- Creatinine Clearance: Pediatrics

Administration: I.V.Administer around-the-clock to promote less variation in peak and trough serum levels. Administer over 3-5 minutes (125-500 mg) or over 10-15 minutes (1-2 g). More rapid infusion may cause seizures. Ampicillin and gentamicin should not be mixed in the same I.V. tubing.

Some penicillins (eg, carbenicillin, ticarcillin, and piperacillin) have been shown to inactivate aminoglycosides *in vitro*. This has been observed to a greater extent with tobramycin and gentamicin, while amikacin has shown greater stability against inactivation. Concurrent use of these agents may pose a risk of reduced antibacterial efficacy *in vivo*, particularly in the setting of profound renal impairment. However, definitive clinical evidence is lacking. If combination penicillin/aminoglycoside therapy is desired in a patient with renal dysfunction, separation of doses (if feasible), and routine monitoring of aminoglycoside levels, CBC, and clinical response should be considered.

Administration: I.V. DetailpH: 8-10 (reconstituted solution)

Administration: OralAdminister around-the-clock to promote less variation in peak and trough serum levels. Administer on an empty stomach (ie, 1 hour prior to, or 2 hours after meals) to increase total absorption.

Dietary ConsiderationsTake on an empty stomach 1 hour before or 2 hours after meals.

Sodium content of 5 mL suspension (250 mg/5 mL): 10 mg (0.4 mEq)

Sodium content of 1 g: 66.7 mg (3 mEq)

Storage

Oral: Oral suspension is stable for 7 days at room temperature or for 14 days under refrigeration.

I.V.:

Solutions for I.M. or direct I.V. should be used within 1 hour. Solutions for I.V. infusion will be inactivated by dextrose at room temperature. If dextrose-containing solutions are to be used, the resultant solution will only be stable for 2 hours versus 8 hours in the 0.9% sodium chloride injection. D_5W has limited stability.

Stability of parenteral admixture in NS at room temperature (25°C) is 8 hours.

Stability of parenteral admixture in NS at refrigeration temperature (4°C) is 2 days.

ReconstitutionI.V.: Minimum volume: Concentration should not exceed 30 mg/mL due to concentration-dependent stability restrictions. Standard diluent: 500 mg/50 mL NS; 1 g/50 mL NS; 2 g/100 mL NS.

Compatibility**Incompatible** in D_5W, D_5NS, $D_{10}W$, fat emulsion 10%, hetastarch 6%, LR; **variable stability (consult detailed reference)** in NS.

Y-site administration: Compatible: Acyclovir, amifostine, aztreonam, clarithromycin, cyclophosphamide, docetaxel, doxorubicin liposome, enalaprilat, esmolol, etoposide, famotidine, filgrastim, fludarabine, foscarnet, gatifloxacin, gemcitabine, granisetron, heparin, heparin with hydrocortisone sodium succinate, insulin (regular), labetalol, levofloxacin, linezolid, magnesium sulfate, melphalan, meperidine, morphine, multivitamins, ofloxacin, perphenazine, phytonadione, potassium chloride, propofol, remifentanil, tacrolimus, teniposide, theophylline, thiotepa, tolazoline, vitamin B complex with C. **Incompatible:** Amphotericin B cholesteryl sulfate complex, epinephrine, fluconazole, hydralazine, midazolam, ondansetron, sargramostim, verapamil, vinorelbine. **Variable (consult detailed reference):** Calcium gluconate, cisatracurium, diltiazem, hetastarch, hydromorphone, vancomycin.

Compatibility in syringe: Compatible: Chloramphenicol, colistimethate, diatrizoate meglumine 52%, diatrizoate sodium 8%, diatrizoate sodium 60%, heparin, iohexol, iopamidol, iothalamate meglumine 60%, ioxaglate meglumine 39.3%, ioxaglate 19.6%, procaine. **Incompatible:** Erythromycin lactobionate, gentamicin, hydromorphone, kanamycin, lincomycin, metoclopramide. **Variable (consult detailed reference):** Lidocaine, polymyxin B sulfate, streptomycin.

Compatibility when admixed: Compatible: Clindamycin, erythromycin lactobionate, floxacillin, furosemide. **Incompatible:** Amikacin, chlorpromazine, dopamine, gentamicin, hydralazine, prochlorperazine. **Variable (consult detailed reference):** Aztreonam, cefepime, cimetidine, heparin, hydrocortisone sodium succinate, metronidazole, metronidazole with sodium bicarbonate, ranitidine, sodium bicarbonate, verapamil.

ContraindicationsHypersensitivity to ampicillin, any component of the formulation, or other penicillins

Allergy Considerations

- Penicillin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Serious and occasionally severe or fatal hypersensitivity (anaphylactoid) reactions have been reported in patients on penicillin therapy, especially with a history of beta-lactam hypersensitivity, history of sensitivity to multiple allergens, or previous IgE-mediated reactions (eg, anaphylaxis, angioedema, urticaria). Use with caution in asthmatic patients.

- Rash: Appearance of a rash should be carefully evaluated to differentiate a nonallergic ampicillin rash from a hypersensitivity reaction; rash occurs in 5% to 10% of children and is a generalized dull red, maculopapular rash, generally appearing 3-14 days after the start of therapy. It normally begins on the trunk and spreads over most of the body. It may be most intense at pressure areas, elbows, and knees.

- Superinfection: Prolonged use may result in fungal or bacterial superinfection, including *C. difficile*-associated diarrhea (CDAD) and pseudomembranous colitis; CDAD has been observed >2 months postantibiotic treatment.

Disease-related concerns:

- Infectious mononucleosis: A high percentage of patients with infectious mononucleosis have developed rash during therapy; ampicillin-class antibiotics not recommended in these patients.

- Renal impairment: Use with caution in patients with renal impairment; dosage adjustment recommended.

Geriatric ConsiderationsAdjust dose for renal function.

Pregnancy Risk FactorB

Pregnancy ConsiderationsAdverse events have not been observed in animal studies; therefore, ampicillin is classified as pregnancy category B. Ampicillin crosses the human placenta, providing detectable concentrations in the cord serum and amniotic fluid. Most studies have not identified a teratogenic potential for ampicillin use during pregnancy. Two possible associations (congenital heart disease and cleft palate) have been noted; each of these was observed in a single study, was not substantiated by other studies, and may have been chance associations. Ampicillin is recommended for use in pregnant women for the management of premature rupture of membranes. Ampicillin is considered an acceptable alternative to penicillin for the prevention of early-onset Group B Streptococcal (GBS) disease in newborns.

The volume of distribution of ampicillin is increased during pregnancy and the half-life is decreased. As a result, serum concentrations in pregnant patients are approximately 50% of those in nonpregnant patients receiving the same dose. Higher doses may be needed during pregnancy. Although oral absorption is not altered during pregnancy, oral ampicillin is poorly-absorbed during labor.

LactationEnters breast milk/use caution

Breast-Feeding ConsiderationsAmpicillin is excreted in breast milk. The manufacturer recommends that caution be exercised when administering ampicillin to nursing women. Due to the low concentrations in human milk, minimal toxicity would be expected in the nursing infant. Nondose-related effects could include modification of bowel flora and allergic sensitization.

Pregnancy & Lactation, In-Depth

- Ampicillin in Pregnancy & Lactation

Adverse ReactionsFrequency not defined.

Central nervous system: Fever, penicillin encephalopathy, seizure

Dermatologic: Erythema multiforme, exfoliative dermatitis, rash, urticaria

Note: Appearance of a rash should be carefully evaluated to differentiate (if possible) nonallergic ampicillin rash from hypersensitivity reaction. Incidence is higher in patients with viral infection, *Salmonella* infection, lymphocytic leukemia, or patients that have hyperuricemia.

Gastrointestinal: Black hairy tongue, diarrhea, enterocolitis, glossitis, nausea, oral candidiasis, pseudomembranous colitis, sore mouth or tongue, stomatitis, vomiting

Hematologic: Agranulocytosis, anemia, hemolytic anemia, eosinophilia, leukopenia, thrombocytopenia purpura

Hepatic: AST increased

Renal: Interstitial nephritis (rare)

Respiratory: Laryngeal stridor

Miscellaneous: Anaphylaxis, serum sickness-like reaction

Drug Interactions

Allopurinol: May enhance the potential for allergic or hypersensitivity reactions to Ampicillin. *Risk C: Monitor therapy*

Atenolol: Ampicillin may decrease the bioavailability of Atenolol. *Risk C: Monitor therapy*

Fusidic Acid: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Methotrexate: Penicillins may decrease the excretion of Methotrexate. *Risk C: Monitor therapy*

Tetracycline Derivatives: May diminish the therapeutic effect of Penicillins. *Risk D: Consider therapy modification*

Typhoid Vaccine: Antibiotics may diminish the therapeutic effect of Typhoid Vaccine. Only the live attenuated Ty21a strain is affected. *Risk D: Consider therapy modification*

Uricosuric Agents: May decrease the excretion of Penicillins. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsFood: Food decreases ampicillin absorption rate; may decrease ampicillin serum concentration.
Test InteractionsMay interfere with urinary glucose tests using cupric sulfate (Benedict's solution, Clinitest®)

Some penicillin derivatives may accelerate the degradation of aminoglycosides *in vitro*, leading to a potential underestimation of aminoglycoside serum concentration.

Monitoring ParametersWith prolonged therapy, monitor renal, hepatic, and hematologic function periodically; observe signs and symptoms of anaphylaxis during first dose
Nursing: Physical Assessment/MonitoringAssess results of culture and sensitivity tests and patient's allergy history prior to starting therapy. Assess potential for interactions with other medications patient may be taking. Caution patients with diabetes about altered response to Clinitest®. Assess therapeutic effectiveness and adverse reactions (eg, opportunistic infection [fever, chills, unhealed sores, white plaques in mouth or vagina, purulent vaginal discharge, fatigue]). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.
Monitoring: Lab TestsPerform culture and sensitivity testing prior to initiating therapy.
Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take entire prescription, even if you are feeling better. Take at equal intervals around-the-clock; preferably on an empty stomach with a full glass of water (1 hour before or 2 hours after meals). Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. If you have diabetes, drug may cause false test results with Clinitest® urine glucose monitoring; use of another type of glucose monitoring is preferable. May cause nausea or vomiting (small, frequent meals, frequent mouth care, sucking lozenges, or chewing gum may help); or diarrhea (buttermilk, boiled milk, or yogurt may help). Report immediately any rash; persistent diarrhea; swelling of face, tongue, mouth, or throat; or chest tightness. Report if condition being treated worsens or does not improve by the time prescription is completed.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 250 mg, 500 mg

Injection, powder for reconstitution, as sodium: 125 mg, 250 mg, 500 mg, 1 g, 2 g, 10 g

Powder for oral suspension: 125 mg/5 mL (100 mL, 200 mL); 250 mg/5 mL (100 mL, 200 mL)

Generic AvailableYes
Pricing: U.S. (www.drugstore.com)

Capsules (Ampicillin)

250 mg (30): $12.99

250 mg (90): $31.95

500 mg (100): $49.99

Mechanism of ActionInhibits bacterial cell wall synthesis by binding to one or more of the penicillin-binding proteins (PBPs) which in turn inhibits the final transpeptidation step of peptidoglycan synthesis in bacterial cell walls, thus inhibiting cell wall biosynthesis. Bacteria eventually lyse due to ongoing activity of cell wall autolytic enzymes (autolysins and murein hydrolases) while cell wall assembly is arrested.

Pharmacodynamics/Kinetics

Absorption: Oral: 50%

Distribution: Bile, blister, and tissue fluids; penetration into CSF occurs with inflamed meninges only, good only with inflammation (exceeds usual MICs)

Normal meninges: Nil; Inflamed meninges: 5% to 10%

Protein binding: 15% to 25%

Half-life elimination:

Children and Adults: 1-1.8 hours

Anuria/end-stage renal disease: 7-20 hours

Time to peak: Oral: Within 1-2 hours

Excretion: Urine (~90% as unchanged drug) within 24 hours

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Oral candidiasis, black hairy tongue, glossitis, sore mouth or tongue, and stomatitis.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusLarge I.V. doses may rarely produce encephalopathy; penicillins have been reported to cause apprehension, illusions, agitation, insomnia, depersonalization, and encephalopathy

Mental Health: Effects on Psychiatric TreatmentRarely may cause bone marrow suppression; use caution with clozapine and carbamazepine

Index TermsAminobenzylpenicillin; Ampicillin Sodium; Ampicillin Trihydrate

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(am PREN a veer)

U.S. Brand NamesAgenerase® [DSC]

Canadian Brand NamesAgenerase®

Pharmacologic CategoryAntiretroviral Agent, Protease Inhibitor

Use: Labeled IndicationsTreatment of HIV infections in combination with at least two other antiretroviral agents; oral solution should only be used when capsules or other protease inhibitors are not therapeutic options

Dosing: Adults**Note:** Capsule and oral solution are **not** interchangeable on a mg-per-mg basis.

HIV infection: Oral:

Capsule:

<50 kg: 20 mg/kg twice daily (maximum: 2400 mg/day)

≥50 kg: 1200 mg twice daily

Dosage adjustments for amprenavir when administered in combination therapy:

Efavirenz: Adjustments necessary for both agents:

Amprenavir 1200 mg 3 times/day (single protease inhibitor) **or**

Amprenavir 1200 mg twice daily plus ritonavir 200 mg twice daily

Ritonavir: Adjustments necessary for both agents:

Amprenavir 1200 mg plus ritonavir 200 mg once daily **or**

Amprenavir 600 mg plus ritonavir 100 mg twice daily

Note: Oral solution of ritonavir and amprenavir should not be coadministered.

Solution:

<50 kg: 22.5 mg/kg (maximum: 2800 mg/day)

≥50 kg: 1400 mg twice daily

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** Capsule and oral solution are **not** interchangeable on a mg-per-mg basis.

HIV infection: Oral:

Capsule:

Children 4-12 years **or** 13-16 years (<50 kg): 20 mg/kg twice daily or 15 mg/kg 3 times daily; maximum: 2400 mg/day

Children >13 years (≥50 kg): 1200 mg twice daily

Solution:

Children 4-12 years **or** 13-16 years (<50 kg): 22.5 mg/kg twice daily or 17 mg/kg 3 times daily; maximum: 2800 mg/day

Children >13 years (≥50 kg): 1400 mg twice daily

Dosing: Renal ImpairmentOral solution is contraindicated in renal failure.

Dosing: Hepatic Impairment

Child-Pugh score between 5-8:

Capsule: 450 mg twice daily

Solution: 513 mg twice daily; contraindicated in hepatic failure.

Child-Pugh score between 9-12:

Capsule: 300 mg twice daily

Solution: 342 mg twice daily; contraindicated in hepatic failure.

Dietary ConsiderationsMay be taken with or without food; do not take with high-fat meal. The 50 mg capsules contain 36.3 int. units of vitamin E per capsule; oral solution contains 46 int. units of vitamin E per mL; avoid additional vitamin E-containing supplements.

ContraindicationsHypersensitivity to amprenavir or any component of the formulation; concurrent therapy with cisapride, ergot derivatives, midazolam, pimozide, and triazolam; severe previous allergic reaction to sulfonamides; oral solution is contraindicated in infants or children <4 years of age, pregnant women, patients with renal or hepatic failure, and patients receiving concurrent metronidazole or disulfiram

Allergy Considerations

- Amprenavir Allergy

Warnings/Precautions

Boxed warnings:

- Ethnic populations: See “Special populations” below.

Concerns related to adverse effects:

- Fat redistribution: May cause redistribution of fat (eg, buffalo hump, peripheral wasting with increased abdominal girth, cushingoid appearance).
- Hypersensitivity reactions: Protease inhibitors have been associated with a variety of hypersensitivity events (some severe), including rash, anaphylaxis (rare), angioedema, bronchospasm, erythema multiforme, and/or Stevens-Johnson syndrome (rare). It is generally recommended to discontinue treatment if severe rash or moderate symptoms accompanied by other systemic symptoms occur.
- Immune reconstitution syndrome: Patients may develop immune reconstitution syndrome resulting in the occurrence of an inflammatory response to an indolent or residual opportunistic infection; further evaluation and treatment may be required.
- Sulfonamide allergy: Use with caution in patients with sulfonamide allergy.

Disease-related concerns:

- Diabetes: Changes in glucose tolerance, hyperglycemia, exacerbation of diabetes, DKA, and new-onset diabetes mellitus have been reported in patients receiving protease inhibitors.
- Hemophilia A or B: Use with caution in patients with hemophilia A or B; increased bleeding during protease inhibitor therapy has been reported.
- Hepatic impairment: May cause hepatitis and/or exacerbate pre-existing hepatic dysfunction; use with caution in patients with underlying hepatic disease, such as hepatitis B or C or cirrhosis.

Concurrent drug therapy issues:

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors, moderate or strong CYP3A4 inducers and major CYP3A4 substrates (see Drug Interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions.
- Vitamin E: Formulations contain vitamin E; additional vitamin E supplements should be avoided.

Special Populations:

- Ethnic populations: **[U.S. Boxed Warning]: Certain ethnic populations (Asians, Eskimos, Native Americans) may be at increased risk of propylene glycol-associated adverse effects; use of the oral solution of amprenavir should be avoided.**
- Pediatrics: Safety and efficacy in children <4 years of age have not been established.

Dosage form specific issues:

- Oral solution: Use oral solution only when capsules or other protease inhibitors are not options; due to increased risk of propylene glycol-associated adverse effects.

Pregnancy Risk FactorC

Pregnancy ConsiderationsIt is not known if amprenavir crosses the human placenta and there are no clinical studies currently underway to evaluate its use in pregnant women. Use of oral solution is contraindicated during pregnancy. Pregnancy and protease inhibitors are both associated with an increased risk of hyperglycemia. Glucose levels should be closely monitored. Health professionals are encouraged to contact the antiretroviral pregnancy registry to monitor outcomes of pregnant women exposed to antiretroviral medications (1-800-258-4263 or www.APRegistry.com).

LactationExcretion in breast milk unknown/contraindicated

Breast-Feeding ConsiderationsHIV-infected mothers are discouraged from breast-feeding to decrease potential transmission of HIV.

Adverse Reactions

>10%:

Central nervous system: Depression/mood disorder (9% to 16%), paresthesia (peripheral 10% to 14%)

Dermatologic: Rash (20% to 27%)

Endocrine & metabolic: Hyperglycemia (>160 mg/dL: 37% to 41%), hypertriglyceridemia (>399 mg/dL: 36% to 47%; >750 mg/dL: 8% to 13%)

Gastrointestinal: Nausea (43% to 74%), vomiting (24% to 34%), diarrhea (39% to 60%), abdominal symptoms

Miscellaneous: Perioral tingling/numbness (26% to 31%)

1% to 10%:

Central nervous system: Headache, fatigue

Dermatologic: Stevens-Johnson syndrome (1% of total, 4% of patients who develop a rash)

Endocrine & metabolic: Hypercholesterolemia (>260 mg/dL: 4% to 9%), hyperglycemia (>251 mg/dL: 2% to 3%), fat redistribution

Gastrointestinal: Taste disorders (2% to 10%), amylase increased (3% to 4%)

Hepatic: AST increased (3% to 5%), ALT increased (4%)

<1%: New-onset diabetes

Metabolism/Transport Effects **Substrate** of CYP2C9 (minor), 3A4 (major); **Inhibits** CYP2C19 (weak), 3A4 (strong)
Drug Interactions

Abacavir: Protease Inhibitors may decrease the serum concentration of Abacavir. *Risk C: Monitor therapy*

Alcohol (Ethyl): May enhance the adverse/toxic effect of Amprenavir. This is specifically related to the propylene glycol contained in amprenavir oral solution, not capsules. *Risk X: Avoid combination*

Alfuzosin: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alfuzosin. *Risk X: Avoid combination*

Alosetron: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Alosetron. *Risk C: Monitor therapy*

Amiodarone: Protease Inhibitors may decrease the metabolism of Amiodarone. *Risk X: Avoid combination*

Antacids: May decrease the absorption of Protease Inhibitors. *Risk C: Monitor therapy*

Antifungal Agents (Azole Derivatives, Systemic): May increase the serum concentration of Protease Inhibitors. Protease Inhibitors may increase the serum concentration of Antifungal Agents (Azole Derivatives, Systemic). Management: Limit indinavir to 600mg every 8 hours with itraconazole or ketoconazole. When used with ritonavir, limit ketoconazole to 200mg/day. Tipranavir labeling recommends limiting fluconazole, itraconazole, and ketoconazole to 200mg with tipranavir/ritonavir. **Exceptions:** Miconazole. *Risk D: Consider therapy modification*

Benzodiazepines (metabolized by oxidation): Protease Inhibitors may decrease the metabolism of Benzodiazepines (metabolized by oxidation). Management: Amprenavir, atazanavir, darunavir, indinavir, nelfinavir, ritonavir, and tipranavir are contraindicated with midazolam and triazolam according to each protease inhibitor's prescribing information. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Dihydropyridine): Protease Inhibitors may decrease the metabolism of Calcium Channel Blockers (Dihydropyridine). **Exceptions:** Clevidipine. *Risk D: Consider therapy modification*

Calcium Channel Blockers (Nondihydropyridine): Protease Inhibitors may decrease the metabolism of Calcium Channel Blockers (Nondihydropyridine). Increased serum concentrations of the calcium channel blocker may increase risk of AV nodal blockade. *Risk D: Consider therapy modification*

CarBAMazepine: May increase the metabolism of Protease Inhibitors. Protease Inhibitors may decrease the metabolism of CarBAMazepine. *Risk D: Consider therapy modification*

Ciclesonide: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ciclesonide. Specifically, concentrations of the active des-ciclesonide metabolite may be increased. *Risk C: Monitor therapy*

Cisapride: Protease Inhibitors may decrease the metabolism of Cisapride. The resultant increase in serum cisapride concentrations may result in QTc prolongation and malignant cardiac arrhythmias. *Risk X: Avoid combination*

Clarithromycin: Protease Inhibitors may diminish the therapeutic effect of Clarithromycin. Specifically, certain protease inhibitors may decrease formation of the active 14-hydroxy-clarithromycin metabolite, which may negatively impact clarithromycin effectiveness vs. H. influenzae and other non-MAC infections. Protease Inhibitors may increase the serum concentration of Clarithromycin. Clarithromycin dose adjustment in renally impaired patients may be needed. Clarithromycin may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

Corticosteroids (Orally Inhaled): Protease Inhibitors may decrease the metabolism of Corticosteroids (Orally Inhaled). **Exceptions:** Beclomethasone; Flunisolide; Triamcinolone. *Risk D: Consider therapy modification*

CycloSPORINE: Protease Inhibitors may increase the serum concentration of CycloSPORINE. CycloSPORINE may increase the serum concentration of Protease Inhibitors. *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Strong) may decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Delavirdine: Amprenavir may decrease the serum concentration of Delavirdine. Delavirdine may increase the serum concentration of Amprenavir. *Risk X: Avoid combination*

Digoxin: Protease Inhibitors may increase the serum concentration of Digoxin. Increased serum concentrations of digoxin may increase risk of

AV nodal blockade. *Risk C: Monitor therapy*

Disulfiram: May enhance the adverse/toxic effect of Amprenavir. This is specifically related to the propylene glycol contained in amprenavir oral solution, not capsules. Management: Specifically, concurrent amprenavir oral solution and disulfiram is contraindicated due to the large amount of propylene glycol in the oral solution. *Risk X: Avoid combination*

Efavirenz: May increase the metabolism of Protease Inhibitors. This specifically includes amprenavir, indinavir, and saquinavir. Efavirenz may increase the serum concentration of Protease Inhibitors. This specifically includes nelfinavir and ritonavir. *Risk D: Consider therapy modification*

Enfuvirtide: Protease Inhibitors may increase the serum concentration of Enfuvirtide. Enfuvirtide may increase the serum concentration of Protease Inhibitors. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Eplerenone. *Risk X: Avoid combination*

Eplerenone: Protease Inhibitors may decrease the metabolism of Eplerenone. *Risk C: Monitor therapy*

Ergot Derivatives: Protease Inhibitors may decrease the metabolism of Ergot Derivatives. **Exceptions:** Cabergoline. *Risk X: Avoid combination*

FentaNYL: CYP3A4 Inhibitors (Strong) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

FentaNYL: Protease Inhibitors may decrease the metabolism of FentaNYL. *Risk C: Monitor therapy*

Fusidic Acid: Protease Inhibitors may decrease the metabolism of Fusidic Acid. Fusidic Acid may decrease the metabolism of Protease Inhibitors. *Risk D: Consider therapy modification*

Garlic: May decrease the serum concentration of Protease Inhibitors. *Risk C: Monitor therapy*

HMG-CoA Reductase Inhibitors: Protease Inhibitors may increase the serum concentration of HMG-CoA Reductase Inhibitors. Limited data suggest pravastatin may slightly decrease protease inhibitor concentrations. Management: Lovastatin and simvastatin are contraindicated with many protease inhibitors; use lowest possible HMG-CoA reductase inhibitor dose and monitor for signs and symptoms of rhabdomyolysis if these agents are used concomitantly. **Exceptions:** Fluvastatin. *Risk D: Consider therapy modification*

Ixabepilone: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ixabepilone. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Meperidine: Protease Inhibitors may enhance the adverse/toxic effect of Meperidine. Protease Inhibitors may decrease the serum concentration of Meperidine. Concentrations of the toxic Normeperidine metabolite may be increased. *Risk D: Consider therapy modification*

Methadone: Protease Inhibitors may decrease the metabolism of Methadone. *Risk C: Monitor therapy*

MetroNIDAZOLE: May enhance the adverse/toxic effect of Amprenavir. This is specifically related to the propylene glycol contained in amprenavir oral solution, not capsules. *Risk X: Avoid combination*

Nefazodone: Protease Inhibitors may decrease the metabolism of Nefazodone. *Risk C: Monitor therapy*

Nevirapine: May increase the metabolism of Protease Inhibitors. *Risk D: Consider therapy modification*

Nilotinib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nilotinib. *Risk X: Avoid combination*

Nisoldipine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Nisoldipine. *Risk X: Avoid combination*

Oral Contraceptive (Estrogens): May diminish the therapeutic effect of Protease Inhibitors. Protease Inhibitors may decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

PARoxetine: Amprenavir may decrease the serum concentration of PARoxetine. *Risk C: Monitor therapy*

P-Glycoprotein Inducers: May decrease the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inducers may also further limit the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

P-Glycoprotein Inhibitors: May increase the serum concentration of P-Glycoprotein Substrates. P-glycoprotein inhibitors may also enhance the distribution of p-glycoprotein substrates to specific cells/tissues/organs where p-glycoprotein is present in large amounts (e.g., brain, T-lymphocytes, testes, etc.). *Risk C: Monitor therapy*

Phenytoin: May increase the serum concentration of Amprenavir. Amprenavir may decrease the serum concentration of Phenytoin. *Risk C: Monitor therapy*

Phosphodiesterase 5 Inhibitors: Protease Inhibitors may decrease the metabolism of Phosphodiesterase 5 Inhibitors. Management: Dose restrictions for tadalafil, and/or sildenafil and vardenafil are recommended in combination with ritonavir, atazanavir, indinavir, darunavir and saquinavir. Consult specific prescribing information for detailed recommendations. *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Strong) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Protease Inhibitors may decrease the metabolism of Pimozide. *Risk X: Avoid combination*

Protease Inhibitors: May increase the serum concentration of other Protease Inhibitors. Management: Atazanavir--indinavir combination contraindicated. Amprenavir oral solution not recommended with ritonavir oral solution; tipranavir/ritonavir or atazanavir/ritonavir not recommended with other protease inhibitors. Other combos may require dose changes. *Risk D: Consider therapy modification*

QuiNIDine: Protease Inhibitors may decrease the metabolism of QuiNIDine. *Risk X: Avoid combination*

Ranolazine: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Ranolazine. *Risk X: Avoid combination*

Rifamycin Derivatives: Protease Inhibitors may decrease the metabolism of Rifamycin Derivatives. Specifically rifabutin. Rifamycin Derivatives may decrease the serum concentration of Protease Inhibitors. Rifampin administration should be avoided. Dosage adjustments with both rifabutin and the protease inhibitors are necessary if used together. Management: Avoid using rifampin with protease inhibitors. Rifabutin and protease inhibitor dose adjustments will likely be required when using rifabutin together with protease inhibitors; consult specific protease inhibitor(s) prescribing information. *Risk D: Consider therapy modification*

Rivaroxaban: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Rivaroxaban. *Risk X: Avoid combination*

Salmeterol: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Salmeterol. *Risk X: Avoid combination*

Sirolimus: Protease Inhibitors may increase the serum concentration of Sirolimus. *Risk C: Monitor therapy*

Sorafenib: CYP3A4 Inhibitors (Strong) may increase the serum concentration of Sorafenib. *Risk C: Monitor therapy*

St Johns Wort: May increase the metabolism of Protease Inhibitors. *Risk X: Avoid combination*

Tacrolimus: Protease Inhibitors may decrease the metabolism of Tacrolimus. *Risk D: Consider therapy modification*

Temsirolimus: Protease Inhibitors may enhance the adverse/toxic effect of Temsirolimus. Levels of sirolimus, the active metabolite, may be increased, likely due to inhibition of CYP-mediated metabolism. *Risk D: Consider therapy modification*

Tenofovir: May decrease the serum concentration of Protease Inhibitors. Protease Inhibitors may increase the serum concentration of Tenofovir. *Risk C: Monitor therapy*

TraZODone: Protease Inhibitors may increase the serum concentration of TraZODone. *Risk D: Consider therapy modification*

Tricyclic Antidepressants: Protease Inhibitors may increase the serum concentration of Tricyclic Antidepressants. *Risk C: Monitor therapy*

Valproic Acid: Protease Inhibitors may decrease the serum concentration of Valproic Acid. *Risk C: Monitor therapy*

Zidovudine: Protease Inhibitors may decrease the serum concentration of Zidovudine. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: Avoid ethanol with amprenavir oral solution.

Food: Levels increased sixfold with high-fat meals.

Herb/Nutraceutical: Amprenavir serum concentration may be decreased by St John's wort; avoid concurrent use. Formulations contain vitamin E; avoid additional supplements.

Nursing: Physical Assessment/MonitoringAssess other pharmacological or herbal products patient may be taking for potential interactions or toxicity (multiple liver enzyme interactions may increase or decrease levels/effects of drugs and increase potential for severe toxicity or loss of effectiveness); dosing adjustments may be necessary. A list of medications that should not be used is available in each bottle and patients should be provided with this information. Assess therapeutic response (CD4 count, hepatic function) and adverse reactions (eg, gastrointestinal disturbance, nausea, vomiting, diarrhea that can lead to dehydration and weight loss; hyperlipidemia and redistribution of body fat; rash; CNS effects, malaise, insomnia, abnormal thinking; electrolyte imbalance) at regular intervals during therapy. Caution patients to monitor glucose levels closely; protease inhibitors may cause hyperglycemia or new-onset diabetes. Teach patient proper use (eg, timing of multiple medications and drugs that should not be used concurrently), possible side effects/appropriate interventions (eg, glucose testing; use of barrier contraceptives, protease inhibitors may decrease effectiveness of oral contraceptives), and adverse symptoms to report.

Monitoring: Lab TestsViral load

Patient EducationYou will be provided with a list of specific medications that should not be used during therapy; do not take any new prescriptions, over-the-counter medications, or herbal products (even if they are not on the list) without consulting prescriber. This drug will not cure HIV, nor has it been found to reduce transmission of HIV; use appropriate precautions to prevent spread to other persons. This drug is prescribed as one part of a multidrug combination; take exactly as directed for full course of therapy. May take with light meal (eg, dry toast, skim milk, corn flakes) to reduce GI upset. Maintain adequate hydration (2-3 L/day of fluids) unless advised by prescriber to restrict fluids. Do not take antacids within one hour of this medication. You may be susceptible to infection; avoid crowds and exposure to known infections and do not have any vaccinations without consulting prescriber. Frequent blood tests may be required with prolonged therapy. You may be advised to check your glucose levels; medication can cause hyperglycemia. May cause body changes due to redistribution of body fat, facial atrophy, or breast enlargement (normal effects of drug); nausea or vomiting (small frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); muscle weakness or flank pain (consult prescriber for approved analgesic); headache or insomnia (consult prescriber for medication); or diarrhea (boiled milk, buttermilk, or yogurt may help). Inform prescriber if you experience muscle numbness or tingling; unresolved persistent vomiting, diarrhea, or abdominal pain; respiratory difficulty or chest pain; unusual skin rash; unusual depression; change in color of stool or urine; or any persistent adverse effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. This drug decreases the effect of oral contraceptives; use of alternative (nonhormonal) forms of contraception is recommended; consult prescriber for use of appropriate barrier contraceptives. Do not breast-feed.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [DSC] = Discontinued product

Capsule:

Agenerase®: 50 mg [contains vitamin E 36.3 int. units (as TPGS)] [DSC]

Solution, oral:

Agenerase®: 15 mg/mL (240 mL) [contains propylene glycol 550 mg/mL and vitamin E 46 int. units/mL; grape-bubble gum-peppermint flavor] [DSC]

Generic AvailableNo

ManufacturerGlaxoSmithKline
Pricing: U.S. (www.drugstore.com)

Capsules (Agenerase)

50 mg (480): $269.04

Solution (Agenerase)

15 mg/mL (240): $49.99

Mechanism of ActionBinds to the protease activity site and inhibits the activity of the enzyme. HIV protease is required for the cleavage of viral polyprotein precursors into individual functional proteins found in infectious HIV. Inhibition prevents cleavage of these polyproteins, resulting in the formation of immature, noninfectious viral particles.

Pharmacodynamics/Kinetics

Absorption: 63%

Distribution: 430 L

Protein binding: 90%

Metabolism: Hepatic via CYP (primarily CYP3A4)

Bioavailability: Not established; increased sixfold with high-fat meal; oral solution: 86% relative to capsule formulation (14% less bioavailable than capsule)

Half-life elimination: 7.1-10.6 hours

Time to peak: 1-2 hours

Excretion: Feces (75%, ~68% as metabolites); urine (14% as metabolites)

Related Information

- Antiretroviral Agents
- Antiretroviral Therapy for HIV Infection: Adults and Adolescents
- Management of Healthcare Worker Exposures to HBV, HCV, and HIV

Pharmacotherapy PearlsPropylene glycol is included in the oral solution; a dose of 22.5 mg/kg twice daily corresponds to an intake of 1650 mg/kg of propylene glycol. Capsule and oral solution are not interchangeable on a mg-per-mg basis.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Perioral tingling/numbness and taste disorder

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDepression is common; may cause headache and fatigue

Mental Health: Effects on Psychiatric TreatmentContraindicated with midazolam and triazolam. Concurrent use with vitamin E and sildenafil should be avoided. May increase concentrations of alprazolam, clorazepate, diazepam, flurazepam, sildenafil, carbamazepine, and pimozide. May increase adverse effects of TCAs (monitor serum levels). Concomitant use of amprenavir and St John's wort is not recommended. Coadministration of protease inhibitors (amprenavir) with St John's wort is expected to substantially decrease protease inhibitor serum concentrations leading to a loss of virologic response and possible resistance to amprenavir or to the class of protease inhibitors.

Anesthesia and Critical Care Concerns/Other ConsiderationsPropylene glycol is included in the oral solution; a dose of 22.5 mg/kg twice daily corresponds to an intake of 1650 mg/kg of propylene glycol. Capsule and oral solution are not interchangeable on a mg-per-mg basis.

Amsacrine

English

Jump To Field (Select Field Name)

Pronunciation(AM sah kreen)

Canadian Brand NamesAMSA PD

Pharmacologic CategoryAntineoplastic Agent

Use: Labeled IndicationsCanada: Refractory acute leukemia

Use: Unlabeled/InvestigationalAcute myeloid leukemia (AML)

Dosing: AdultsDetails concerning dosing in combination regimens should also be consulted.

Acute leukemia: I.V.:

Induction: 75-125 mg/m^2/day for 5 days every 3-4 weeks (125 mg/m^2/day is preferred; two courses may be necessary to achieve induction; increase dose by 20% in second and subsequent cycles if marrow hypoplasia not achieved and in absence of significant toxicity in previous course.)

Maintenance: Once remission has been achieved, maintenance dose should be ~50% of induction dose, administered every 4-8 weeks, depending on blood counts and marrow recovery

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Dosage reduction recommended; specific guidelines from the manufacturer are not available; the following guidelines have been used by some clinicians:

Hall, 1983:

Serum creatinine 1.2-1.8 mg/dL: No adjustment recommended

Serum creatinine 2-3 mg/dL, oliguric patients: Administer 60% to 70% of dose; may increase subsequent dose based on toxicity.

Hornedo, 1985: BUN >20 mg/dL or serum creatinine >1.5 mg/dL: Administer 75% of dose

Dosing: Hepatic ImpairmentBilirubin >2 mg/dL: Dosage reduction recommended; specific guidelines from the manufacturer are not available; the following guidelines have been used by some clinicians:

Hall, 1983: Bilirubin >2 mg/dL: Administer 60% to 70% of dose; may increase subsequent dose based on toxicity.

Hornedo, 1985: Bilirubin >2 mg/dL: Administer 75% of dose

Koren, 1992: Severe hepatic dysfunction: Administer ≤50% of dose

Dosing: Adjustment for ToxicityConsider decreasing dose by 20% if life-threatening infection or hemorrhage occurred in previous cycle; delay second and subsequent cycles until recovery from myelosuppression or evidence of leukemic infiltrate is evident.

Calculations

- Body Surface Area: Adults
- Body Surface Area: Pediatrics

Administration: I.V.Infuse over 60-90 minutes; avoid extravasation.

StorageStore intact ampuls and diluent vials at controlled room temperature of 15°C to 25°C (59°F to 77°F). Concentrated amsacrine should not be stored in plastic syringes for >15 minutes. Reconstituted vials may be stored at room temperature for up to 24 hours, under ambient light conditions. Solutions diluted for administration are stable for up to 7 days in glass or plastic containers, however, the manufacturer recommends use with in 24 hours when stored at room temperature and 72 hours if refrigerated.

ReconstitutionUse appropriate precautions for handling and disposal. Reconstitute by adding 1.5 mL amsacrine to diluent vial (containing 13.5 mL L-lactic acid), resulting in a 5 mg/mL reconstituted solution. Glass syringes should be used, however if using plastic syringes, do not allow concentrated amsacrine to remain in plastic syringe for >15 minutes. Further dilute appropriate dose in 500 mL D_5W (the solution may be mixed in plastic bags when diluted for infusion).

CompatibilityStable in D_5W; **incompatible** with BNS, D_5NS, $D_5{}^1/_4NS$, $D_5{}^1/_2NS$, D_5LR, $D_{10}NS$, NSS, LR, chloride ion. Amsacrine forms an immediate precipitate in the presence of chloride ion; do not mix with drugs that are chloride or hydrochloride salts.

Y-site administration: Compatible: Amikacin, chlorpromazine, clindamycin, cytarabine, dexamethasone, diphenhydramine, famotidine, fludarabine, gentamicin, granisetron, haloperidol, hydrocortisone sodium succinate, hydromorphone, lorazepam, morphine, prochlorperazine, promethazine, ranitidine, sodium bicarbonate, tobramycin, vancomycin. **Incompatible:** Acyclovir, amphotericin, aztreonam, calcium chloride, ceftazidime, ceftriaxone, cephalothin, cimetidine, cisplatin, filgrastim, furosemide, ganciclovir, heparin, methylprednisolone, metoclopramide, ondansetron, potassium chloride, sargramostim.

Compatibility when admixed: Compatible: Sodium bicarbonate, bleomycin

RestrictionsNot available in U.S.

ContraindicationsHypersensitivity to amsacrine, acridine derivatives, or any component of the formulation; pre-existing bone marrow suppression due to chemotherapy or radiation therapy

Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Bone marrow suppression: Myelosuppression, including transient leukopenia, is a common toxicity; prolonged marrow aplasia may occur. May require dose reduction, therapy interruption or treatment delay.
- Cardiovascular effects: Acute cardiotoxicity, including arrhythmia, ECG changes, and rarely, cardiomyopathy and CHF, have been reported with use, although generally not considered to be a cumulative dose effect. Risk factors for cardiotoxicity may include hypokalemia and a history of anthracycline therapy. Correct fluid and electrolyte imbalance prior to treatment initiation. Use with caution in patients with underlying cardiovascular disease.
- Tumor lysis syndrome: Tumor lysis syndrome may occur; adequate hydration and prophylactic uric acid reduction should be considered prior to or during treatment; monitor closely.

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with significant hepatic impairment (bilirubin >2 mg/dL); toxicity may be increased. Hepatic metabolism and biliary excretion are major routes of elimination. Dosage reductions may be recommended. Evaluate hepatic function prior to and during treatment.
- Hypokalemia: Serum potassium should be >4 mEq/L prior to administration (Arlin, 1988). The risk for arrhythmia is decreased by ensuring normal potassium levels.
- Renal impairment: Use with caution in patients with significant renal impairment (BUN >20 mg/dL; serum creatinine >1.2 mg/dL); toxicity may be increased. Dosage reductions may be recommended. Evaluate renal function prior to and during treatment.

Concurrent drug therapy issues:

- Anthracyclines: Use with caution in patients who have received high cumulative doses of anthracyclines (may increase the risk for cardiotoxicity).
- Vaccinations: Avoid vaccination with live virus vaccines during treatment.

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Women of childbearing potential should avoid becoming pregnant while receiving treatment.

LactationExcretion in breast milk unknown/not recommended

Breast-Feeding ConsiderationsBreast-feeding should be discontinued prior to treatment.

Adverse Reactions

>10%:

Gastrointestinal: Nausea (>10%), vomiting (>10%), stomatitis (>10%), diarrhea (>10%), perirectal abscess (>10%), abdominal pain (>10%)

Hematologic: Myelosuppression, leukopenia (nadir: 11-13 days; recovery: days 17-25)

Frequency not defined:

Cardiovascular: Atrial tachyarrhythmia, atrial tachycardia, atrial fibrillation, bradycardia, cardiomyopathy (rare), cardiopulmonary arrest, CHF (rare); ECG changes (QT prolongation, nonspecific ST segment or T wave changes); ejection fraction decreased, hypotension, sinus tachycardia, tachycardia, ventricular arrhythmia, ventricular extrasystoles, ventricular fibrillation, ventricular tachyarrhythmia

Central nervous system: Confusion, dizziness, emotional lability, fever, headache, hypoesthesia, lethargy, seizure

Dermatologic: Alopecia, cutaneous inflammatory reaction, dermatologic reaction, purpura, rash (purpuric or maculopapular), urticaria

Gastrointestinal: Anorexia, dysphagia, gingivitis, gum hemorrhage, hematemesis, weight changes

Genitourinary: Orange-red discoloration of the urine

Hematologic: Anemia, granulocytopenia, hemorrhage, pancytopenia, thrombocytopenia

Hepatic: Alkaline phosphatase increased, AST increased, bilirubin increased, hepatic insufficiency, hepatitis, hepatotoxicity, jaundice, progressive liver failure

Local: Injection site inflammation, phlebitis

Neuromuscular & skeletal: Musculoskeletal pain, paresthesia, weakness

Renal: BUN increased, creatinine increased, hematuria, proteinuria, renal failure

Respiratory: Dyspnea

Miscellaneous: Allergic reaction, infection

Oncology: VesicantYes; see Management of Drug Extravasations.
Oncology: Emetic PotentialModerate (30% to 60%)
Drug Interactions

Cardiac Glycosides: Antineoplastic Agents may decrease the absorption of Cardiac Glycosides. This may only affect digoxin tablets. **Exceptions:** Digitoxin. *Risk C: Monitor therapy*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Vitamin K Antagonists (eg, warfarin): Antineoplastic Agents may enhance the anticoagulant effect of Vitamin K Antagonists. Antineoplastic Agents may diminish the anticoagulant effect of Vitamin K Antagonists. *Risk C: Monitor therapy*

Monitoring Parameters

CBC with differential, bone marrow studies, serum potassium, hepatic function, renal function; ECG (during and after infusion)

Monitoring: Lab Tests

CBC with differential, bone marrow studies, serum potassium, hepatic function, renal function

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling. [CAN] = Canadian brand name

Injection, solution [preservative free]:

AMSA PD [CAN]: 50 mg/mL (1.5 mL) [supplied with L-lactic acid 0.0353 M 13.5 mL] [not available in the U.S.]

Generic AvailableNo
Mechanism of ActionAmsacrine has been shown to inhibit DNA synthesis by binding to, and intercalating with, DNA; inhibits topoisomerase II activity.
Pharmacodynamics/Kinetics

Distribution: V_d: 1.67 L/kg; minimal CNS penetration

Protein binding: 96% to 98%

Metabolism: Hepatic, to inactive metabolites (major metabolite is 5′ glutathione conjugate)

Half-life elimination: 1.4-5 hours; Terminal: 8-9 hours

Excretion: Bile; urine (35%; 20% as unchanged drug)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Oral ulcerations and stomatitis
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusMay cause dizziness or confusion
Mental Health: Effects on Psychiatric TreatmentECG changes are common; avoid concomitant use with ziprasidone. GI side effects are common; concomitant use with SSRIs, lithium, or valproic acid may produce additive effects. Hematologic adverse effects are common; use caution with clozapine and valproic acid.
Index Terms4-(9-Acridinylamino) Methanesulfon-m-Anisidide; Acridinyl Anisidide; AMSA; m-AMSA; NSC-249992

International Brand NamesAmekrin (DK, SE); Amsidine (BE, NL); Amsidyl (AU)

Amyl Nitrite

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(AM il NYE trite)

Pharmacologic CategoryAntidote; Vasodilator

Use: Labeled IndicationsCoronary vasodilator in angina pectoris; adjunct in treatment of cyanide poisoning; produce changes in the intensity of heart murmurs

Dosing: Adults

Angina: Inhalation: 1-6 inhalations from 1 crushed ampul; may repeat in 3-5 minutes

Cyanide poisoning: Inhalation: Inhale the vapor from a 0.3 mL crushed ampul every minute for 15-30 seconds until I.V. sodium nitrite infusion is available

Dosing: ElderlyRefer to adult dosing.

Administration: OralAdminister nasally. Keep patient lying down during administration. Crush ampul in woven covering between fingers and then hold under patient's nostrils for 15-30 seconds.

StorageStore in cool place and protect from light.

ContraindicationsHypersensitivity to nitrates; severe anemia; head injury; angle-closure glaucoma; postural hypotension; head trauma or cerebral hemorrhage; pregnancy

Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with coronary artery disease and patients with hypotension.
- Increased intracranial pressure: Use with caution in patients with increased intracranial pressure.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorC

LactationExcretion in breast milk unknown/not recommended

Adverse ReactionsFrequency not defined.

Cardiovascular: Postural hypotension, cutaneous flushing of head, neck, and clavicular area, palpitations, tachycardia, sinus tachycardia, vasodilation

Central nervous system: Headache, incoherent speech, restlessness

Dermatologic: Contact dermatitis

Gastrointestinal: Nausea, colitis, vomiting

Genitourinary: Penile erection enhanced, retarded ejaculation

Hematologic: Heinz body hemolysis/hemolytic anemia

Ocular: Increased intraocular pressure, blurred vision

Respiratory: Tracheobronchitis

Drug Interactions

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Monitoring ParametersMonitor blood pressure during therapy

Nursing: Physical Assessment/MonitoringMonitor blood pressure and heart rate closely during and following therapy. **Pregnancy risk factor X.** Breast-feeding is not recommended.

Patient EducationWhen this drug is used in emergency situations, patient education should be appropriate to situation (ie, do not change positions or make any sudden moves without asking for assistance). If patient administered, lie down during administration, crush ampul in woven covering between fingers, and then hold under nose and inhale. May repeat in 3-5 minutes if necessary. If no relief after three doses, contact emergency services for immediate transport to the hospital. Vapors are highly flammable; do not use where vapors may ignite. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant, may cause severe fetal defects. Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Vapor for inhalation [crushable covered glass capsules]: Amyl nitrite USP (0.3 mL)

Generic AvailableYes

Mechanism of ActionRelaxes vascular smooth muscle; decreased venous ratios and arterial blood pressure; reduces left ventricular work; decreases myocardial O_2 consumption; in cyanide poisoning, amyl nitrite converts hemoglobin to methemoglobin that binds with cyanide to form cyanate hemoglobin

Pharmacodynamics/Kinetics

Onset of action: Angina: Within 30 seconds

Duration: 3-15 minutes

Pharmacotherapy PearlsAmyl nitrite may be used during echocardiographic evaluation to elicit a gradient across the cardiovascular outflow tract in patients with underlying hypertrophic obstructive cardiomyopathy. Amyl nitrite is also used as a recreational drug during intercourse. However, when used in combination with sildenafil (Viagra®), significant and profound hypotension may result.

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Postural hypotension

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause headache

Mental Health: Effects on Psychiatric TreatmentNone reported

Cardiovascular ConsiderationsAmyl nitrite may be used during echocardiographic evaluation to elicit a gradient across the cardiovascular outflow tract in patients with underlying hypertrophic obstructive cardiomyopathy. Amyl nitrite is also used as a recreational drug during intercourse. However, when used in combination with sildenafil (Viagra®), significant and profound hypotension may result.

Anesthesia and Critical Care Concerns/Other ConsiderationsHighly flammable - do not use where it might be ignited. Amyl nitrate is also used as a recreational drug during intercourse. However, when used in combination with phosphodiesterase-5 enzyme inhibitors, significant and profound hypotension may result.

Index TermsIsoamyl Nitrite

International Brand NamesAmyl Nitrite (NZ)

Anagrelide

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(an AG gre lide)
U.S. Brand NamesAgrylin®
Canadian Brand NamesAgrylin®; Dom-Anagrelide; Gen-Anagrelide; PHL-Anagrelide; PMS-Anagrelide; Sandoz-Anagrelide
Pharmacologic CategoryPhospholipase A_2 Inhibitor
Use: Labeled IndicationsTreatment of thrombocythemia associated with myeloproliferative disorders
Use: Unlabeled/InvestigationalTreatment of essential thrombocythemia (ET)
Dosing: AdultsThrombocythemia: Oral: 0.5 mg 4 times/day or 1 mg twice daily (most patients will experience adequate response at dose ranges of 1.5-3 mg/day)

Note: Maintain for ≥1 week, then adjust to the lowest effective dose to reduce and maintain platelet count <600,000/µL ideally to the normal range; the dose must not be increased by >0.5 mg/day in any 1 week; maximum dose: 10 mg/day or 2.5 mg/dose

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricThrombocythemia: Oral: Initial: 0.5 mg/day (range: 0.5 mg 1-4 times/day); see "**Note**" in adult dosing.
Dosing: Hepatic Impairment

Moderate impairment: Initial: 0.5 mg once daily; maintain for at least 1 week with careful monitoring of cardiovascular status; the dose must not be increased by >0.5 mg/day in any 1 week.

Severe impairment: Contraindicated

Administration: OralAdminister 2-4 times/day. May be taken without regard to food.
Dietary ConsiderationsMay be taken without regard to food.
StorageStore at 27°C (77°F); excursions permitted to 15°C to 30°C (59°F to 86°F). Protect from light.
ContraindicationsSevere hepatic impairment
Allergy Considerations

- Anagrelide Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Pulmonary disorders: Interstitial lung disease (including allergic alveolitis, eosinophilic pneumonia, and interstitial pneumonitis) has been associated with use. Onset is from 1 week to several years, with most cases presenting with progressive dyspnea with lung infiltrations; symptoms usually improve after discontinuation.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with known or suspected heart disease; tachycardia, orthostatic hypotension, and heart failure have been reported. Pretreatment cardiovascular evaluation and careful monitoring during treatment is recommended.

- Hepatic impairment: Use with caution in patients with mild-to-moderate hepatic impairment (measures of liver function >1.5 times ULN); dosage reduction and careful cardiovascular monitoring is required for moderate impairment; use is contraindicated in severe hepatic impairment.

- Renal impairment: Use with caution in patients with renal impairment (serum creatinine ≥2 mg/dL); monitor closely.

Pregnancy Risk FactorC
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies; however, decreased pup survival was noted. Use of anagrelide during pregnancy is limited. The manufacturer recommends effective contraception in women of childbearing potential. Use during pregnancy only if potential benefit to mother outweighs possible risk to the fetus.
LactationExcretion in breast milk unknown/not recommended
Adverse Reactions

>10%:

Cardiovascular: Palpitation (26%), edema (21%)

Central nervous system: Headache (44%), dizziness (15%), pain (15%)

Gastrointestinal: Diarrhea (26%), nausea (17%), abdominal pain (16%)

Neuromuscular & skeletal: Weakness (23%)

Respiratory: Dyspnea (12%)

1% to 10%:

Cardiovascular: Peripheral edema (9%), chest pain (8%), tachycardia (8%), angina, arrhythmia, cardiovascular disease, CHF, hypertension, postural hypotension, syncope, thrombosis, vasodilatation

Central nervous system: Fever (9%), malaise (6%), amnesia, chills, confusion, depression, insomnia, migraine, nervousness, somnolence

Dermatologic: Rash (8%), pruritus (6%), alopecia, bruising, photosensitivity, urticaria

Endocrine & skeletal: Dehydration

Gastrointestinal: Flatulence (10%), vomiting (10%), anorexia (8%), dyspepsia (5%), aphthous stomatitis, constipation, eructation, gastritis, GI distress, GI hemorrhage, melena

Hematologic: Thrombocytopenia (9%; grades 3/4: 5%), anemia, hemorrhage

Hepatic: Liver enzymes increased

Neuromuscular & skeletal: Back pain (6%), paresthesia (6%), arthralgia, leg cramps, myalgia

Ocular: Amblyopia, diplopia, visual field abnormality

Otic: Tinnitus

Renal: Dysuria, hematuria

Respiratory: Pharyngitis (7%), cough (6%), asthma, bronchitis, epistaxis, pneumonia, rhinitis, sinusitis

Miscellaneous: Flu-like syndrome, lymphadenopathy

Frequency not defined: Atrial fibrillation, cardiomegaly, cardiomyopathy, cerebrovascular accident, complete heart block, deep vein thrombosis, gastric/duodenal ulceration; interstitial lung disease (allergic alveolitis, eosinophilic pneumonia, interstitial pneumonitis); leukocyte count increased, MI, myelofibrosis, pancreatitis, pericarditis, pericardial effusion, pleural effusion, polycythemia, pulmonary fibrosis, pulmonary hypertension, pulmonary infiltrates, renal abnormalities, renal failure, seizure, stroke, transient ischemic attack

Oncology: Emetic PotentialLow (10% to 30%)

Metabolism/Transport Effects**Substrate** of CYP1A2 (minor)

Drug Interactions

Anticoagulants: Antiplatelet Agents may enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of other Antiplatelet Agents. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Drotrecogin Alfa: Antiplatelet Agents may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Antiplatelet Agents. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to impaired platelet function and an increased risk of bleeding. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the adverse/toxic effect of Antiplatelet Agents. An increased risk of bleeding may occur. Nonsteroidal Anti-Inflammatory Agents may diminish the cardioprotective effect of Antiplatelet Agents. This interaction is likely specific to aspirin, and not to other antiplatelet agents. *Risk C: Monitor therapy*

Omega-3-Acid Ethyl Esters: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the adverse/toxic effect of Antiplatelet Agents. Specifically, the risk of bleeding may be increased by concurrent use of these agents. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the antiplatelet effect of Antiplatelet Agents. *Risk C: Monitor therapy*

Salicylates: Antiplatelet Agents may enhance the adverse/toxic effect of Salicylates. Increased risk of bleeding may result. *Risk C: Monitor therapy*

Thrombolytic Agents: Antiplatelet Agents may enhance the anticoagulant effect of Thrombolytic Agents. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Antiplatelet Agents may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse events may be increased. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Ethanol: May increase CNS adverse effects.

Food: No clinically significant effect on absorption.

Herb/Nutraceutical: Avoid herbs with anticoagulant/antiplatelet properties (alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose oil, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng [American], ginseng [Panax], ginseng [Siberian], grape seed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAMe [S-adenosylmethionine], sweet clover, turmeric, white willow); may enhance the adverse effect of antiplatelets agents.

Monitoring ParametersPlatelet count (every 2 days during the first week of treatment and at least weekly until the maintenance dose is reached); CBC with differential, ALT, AST, BUN, and serum creatinine (monitor closely during first weeks of treatment); blood pressure; cardiovascular exam (pretreatment; monitor during therapy). Monitor for thrombosis or bleeding.

Monitoring: Lab TestsPlatelet count (every 2 days during the first week of treatment and at least weekly until the maintenance dose is reached); CBC with differential, ALT, AST, BUN, and serum creatinine (monitor closely during first weeks of treatment); blood pressure; cardiovascular exam (pretreatment; monitor during therapy).

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule: 0.5 mg, 1 mg

Agrylin®: 0.5 mg

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Capsules (Agrylin)

0.5 mg (50): $270.99

1 mg (50): $546.00

Capsules (Anagrelide HCl)

0.5 mg (30): $79.55

1 mg (50): $99.99

Mechanism of ActionAnagrelide appears to inhibit cyclic nucleotide phosphodiesterase and the release of arachidonic acid from phospholipase, possibly by inhibiting phospholipase A_2. It also causes a dose-related reduction in platelet production, which results from decreased megakaryocyte hypermaturation (disrupts the postmitotic phase of maturation).

Pharmacodynamics/Kinetics

Onset: Initial: Within 7-14 days; complete response (platelets $\leq$600,000/mm^3): 4-12 weeks

Duration: 6-24 hours; upon discontinuation, platelet count begins to rise within 4 days

Metabolism: Hepatic; to RL603 and 3-hydroxy anagrelide

Half-life elimination, plasma: 1.3 hours

Time to peak, serum: 1 hour

Excretion: Urine (<1% as unchanged drug)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Orthostatic hypotension

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay impair ability to concentrate and produce bad dreams

Mental Health: Effects on Psychiatric TreatmentMay cause hypotension which may be exacerbated by psychotropics; may cause heart block; use caution with TCAs

Index TermsAnagrelide Hydrochloride; BL4162A; NSC-724577

International Brand NamesAgrelid (AR); Agrylin (AU, HK, ID, IL, KP, PH, TW); Thromboreductin (HK, ID, MY); Xagrid (AT, BE, BG, CH, CZ, DE, DK, ES, FI, FR, GB, GR, HN, IE, IT, NL, NO, PT, RU, SE, TR)

Anakinra

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Anakinra may be confused with amikacin

Pronunciation(an a KIN ra)

U.S. Brand NamesKineret®

Canadian Brand NamesKineret®

Pharmacologic CategoryAntirheumatic, Disease Modifying; Interleukin-1 Receptor Antagonist

Use: Labeled IndicationsTreatment of moderately- to severely-active rheumatoid arthritis in adult patients who have failed one or more disease-modifying antirheumatic drugs (DMARDs); may be used alone or in combination with DMARDs (other than tumor necrosis factor-blocking agents)

Dosing: AdultsRheumatoid arthritis: SubQ: 100 mg once daily (administer at approximately the same time each day)

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentCl_{cr} <30 mL/minute and/or end-stage renal disease: 100 mg every other day

Administration: OtherSubQ: Rotate injection sites (thigh, abdomen, upper arm); injection should be given at least 1 inch away from previous injection site. Do not shake. Provided in single-use, preservative free syringes with 27-gauge needles; discard any unused portion.

StorageStore in refrigerator at 2°C to 8°C (36°F to 46°F); do not freeze. Do not shake. Protect from light.

ContraindicationsHypersensitivity to *E. coli*-derived proteins, anakinra, or any component of the formulation; patients with active infections (including chronic or local infection)

Allergy Considerations

- Anakinra Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: May cause hypersensitivity, anaphylaxis, or anaphylactoid reactions; medications for the treatment of hypersensitivity reactions should be available for immediate use.

- Infections: Caution should be exercised when considering the use in patients with a history of new/recurrent infections, with conditions that predispose them to infections, or with chronic, latent, or localized infections. Patients who develop a new infection while undergoing treatment should be monitored closely. If a patient develops a serious infection, therapy should be discontinued.

- Malignancy: Use may affect defenses against malignancies; impact on the development and course of malignancies is not fully defined. As compared to the general population, an increased risk of lymphoma has been noted in clinical trials; however, rheumatoid arthritis has been previously associated with an increased rate of lymphoma.

Disease-related concerns:

- Asthma: Use with caution in patients with asthma; may have increased risk of serious infection.

- Hematologic disorders: Use with caution in patients with a history of significant hematologic abnormalities; therapy has been associated with uncommon, but significant decreases in hematologic parameters (particularly neutrophil counts). Patients must be advised to seek medical attention if they develop signs and symptoms suggestive of blood dyscrasias; discontinue if significant hematologic abnormalities are confirmed.

- Renal impairment: Use caution in patients with renal impairment; consider increased dosing intervals for severe renal dysfunction (Cl_{cr} <30 mL/minute).

Concurrent drug therapy issues:

- TNF-blocking agents: Should not be used in combination with tumor necrosis factor antagonists, unless no satisfactory alternatives exist, and then only with extreme caution.

Special populations:

- Elderly: Use caution due to the potential higher risk for infections.

- Pediatrics: Efficacy has not been established in children; use is not recommended.

Dosage form specific issues:

- Latex: The packaging (needle cover) contains latex.

Other warnings/precautions:

- Immunizations: Patients should be brought up to date with all immunizations before initiating therapy; live vaccines should not be given concurrently. There is no data available concerning the effects of therapy on vaccination or secondary transmission of live vaccines in patients receiving therapy.

Geriatric ConsiderationsClinical trials with older adults (65% to 75%) demonstrated no clinical differences between elderly patients and younger adults in safety and efficacy. Since elderly may be more liable to infections in general, use with caution. Also, since many elderly patients may have Cl_{cr} <30 mL/minute, close monitoring should be followed with calculation of creatinine clearance prior to initiating therapy with anakinra.

Pregnancy Risk FactorB

Pregnancy ConsiderationsNo evidence of impaired fertility or harm to fetus in animal models; however, there are no controlled trials in pregnant women. Women exposed to anakinra during pregnancy may contact the Organization of Teratology Information Services (OTIS), Rheumatoid Arthritis and Pregnancy Study at 1-877-311-8972.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsEndogenous interleukin-1 receptor antagonist can be found in breast milk; specific excretion of anakinra is not known.

Adverse Reactions

>10%:

Central nervous system: Headache (12%)

Local: Injection site reaction (majority mild, typically lasting 14-28 days, characterized by erythema, ecchymosis, inflammation, and pain; up to 71%)

Miscellaneous: Infection (39% versus 37% in placebo; serious infection 2% to 3%)

1% to 10%:

Gastrointestinal: Nausea (8%), diarrhea (7%), abdominal pain (5%)

Hematologic: Neutropenia (8%; grades 3/4: 0.4%)

Respiratory: Sinusitis (7%)

Miscellaneous: Flu-like syndrome (6%)

<1%: Cellulitis, leukopenia, opportunistic infection, malignancies (including lymphoma, melanoma), thrombocytopenia

Drug Interactions

Anti-TNF Agents: May enhance the adverse/toxic effect of Anakinra. An increased risk of serious infection during concomitant use has been reported. *Risk X: Avoid combination*

Echinacea: May diminish the therapeutic effect of Immunosuppressants. *Risk D: Consider therapy modification*

Natalizumab: Immunosuppressants may enhance the adverse/toxic effect of Natalizumab. Specifically, the risk of concurrent infection may be increased. *Risk X: Avoid combination*

Trastuzumab: May enhance the neutropenic effect of Immunosuppressants. *Risk C: Monitor therapy*

Vaccines (Inactivated): Immunosuppressants may diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Vaccines (Live): Immunosuppressants may enhance the adverse/toxic effect of Vaccines (Live). Vaccinal infections may develop. Immunosuppressants may also decrease therapeutic response to vaccines. *Risk X: Avoid combination*

Monitoring ParametersCBC with differential (baseline, then monthly for 3 months, then every 3 months); serum creatinine

Nursing: Physical Assessment/MonitoringSee Contraindications and Warnings/Precautions for use cautions. Monitor effectiveness of therapy (eg, pain, range of motion, mobility, ADL function, inflammation). Teach patient proper use if self-administered (appropriate injection technique and syringe/needle disposal), possible side effects/appropriate interventions, and adverse symptoms to report (see Patient Education). Note breast-feeding caution.

Monitoring: Lab TestsCBC with differential (baseline, then monthly for 3 months, then every 3 months); serum creatinine

Patient EducationIf self-injecting, follow instructions for injection and disposal of needles exactly. If redness, swelling, or irritation appears at the injection site, contact prescriber. Do not have any vaccinations while using this medication without consulting prescriber first. You may experience headache (use caution when driving or engaging in tasks requiring alertness until response to drug is known). If stomach pain or cramping, unusual bleeding or bruising, persistent fever, or paleness occurs, stop medication and contact prescriber **immediately**. Also, immediately report skin rash, unusual muscle or bone weakness, or signs of respiratory flu or other infection (eg, chills, fever, sore throat, easy bruising or bleeding, mouth sores, unhealed sores). **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution [preservative free]:

Kineret®: 100 mg/0.67 mL (1 mL) [prefilled syringe; needle cover contains latex]

Generic AvailableNo

ManufacturerAmgen Inc

Pricing: U.S. (www.drugstore.com)

Solution (Kineret)

100 mg/0.67 mL (4.69): $349.99

Mechanism of ActionAntagonist of the interleukin-1 (IL-1) receptor. Endogenous IL-1 is induced by inflammatory stimuli and mediates a variety of immunological responses, including degradation of cartilage (loss of proteoglycans) and stimulation of bone resorption.

Pharmacodynamics/Kinetics

Bioavailability: SubQ: 95%

Half-life elimination: Terminal: 4-6 hours

Time to peak: SubQ: 3-7 hours

Pharmacotherapy PearlsAnakinra is produced by recombinant DNA/*E. coli* technology.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentMay cause leukopenia and rarely neutropenia; use caution with clozapine and carbamazepine. May cause nausea and diarrhea; monitor with concurrent SSRI, lithium, or valproic acid use.

Index TermsIL-1Ra; Interleukin-1 Receptor Antagonist

Anastrozole

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Anastrozole may be confused with letrozole

Pronunciation(an AS troe zole)
U.S. Brand NamesArimidex®
Canadian Brand NamesArimidex®
Pharmacologic CategoryAntineoplastic Agent, Aromatase Inhibitor
Use: Labeled IndicationsTreatment of locally-advanced or metastatic breast cancer (ER-positive or hormone receptor unknown) in postmenopausal women; treatment of advanced breast cancer in postmenopausal women with disease progression following tamoxifen therapy; adjuvant treatment of early ER-positive breast cancer in postmenopausal women
Dosing: AdultsBreast cancer: Oral (refer to individual protocols): 1 mg once daily
Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentDosage adjustment is not necessary.
Dosing: Hepatic ImpairmentMild-to-moderate impairment: Plasma concentrations in subjects with stable hepatic cirrhosis were within the range concentrations in normal subjects across all clinical trials; therefore, no dosage adjustment required; however, patients should be monitored for side effects. Safety and efficacy in severe hepatic impairment have not been established.
StorageStore at 20°C to 25°C (68°F to 77°F).
ContraindicationsHypersensitivity to anastrozole or any component of the formulation; pregnancy
Warnings/Precautions

Special handling:

- Hazardous agent: Use appropriate precautions for handling and disposal.

Concerns related to adverse effects:

- Decreased bone mineral density: May cause decreases in bone mineral density.
- Hyperlipidemia: Total cholesterol and LDL-cholesterol increase in patients receiving anastrozole; use with caution in patients with hyperlipidemias.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.
- Pregnancy: Exclude pregnancy before initiating.
- Premenopausal women: Safety and efficacy have not been established in premenopausal women.

Geriatric ConsiderationsNo age-related changes in pharmacokinetics were noted in clinical trials.
Pregnancy Risk FactorD
Pregnancy ConsiderationsFetotoxicity was observed in animal studies. Safety and efficacy have not been established in premenopausal women; exclude pregnancy prior to treatment.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

>10%:

Cardiovascular: Vasodilatation (25% to 36%), hypertension (2% to 13%)

Central nervous system: Mood disturbance (19%), fatigue (19%), pain (11% to 17%), headache (9% to 13%), depression (5% to 13%)

Dermatologic: Rash (6% to 11%)

Endocrine & metabolic: Hot flashes (12% to 36%)

Gastrointestinal: Nausea (11% to 19%), vomiting (8% to 13%)

Neuromuscular & skeletal: Weakness (16% to 19%), arthritis (17%), arthralgia (2% to 15%), back pain (10% to 12%), bone pain (6% to 11%), osteoporosis (11%)

Respiratory: Pharyngitis (6% to 14%), cough increased (8% to 11%)

1% to 10%:

Cardiovascular: Peripheral edema (5% to 10%), chest pain (5% to 7%), ischemic cardiovascular disease (4%), venous thromboembolic events (3% to 4%), ischemic cerebrovascular events (2%), angina (2%)

Central nervous system: Insomnia (2% to 10%), dizziness (6% to 8%), anxiety (2% to 6%), fever (2% to 5%), malaise (2% to 5%), confusion (2% to 5%), nervousness (2% to 5%), somnolence (2% to 5%), lethargy (1%)

Dermatologic: Alopecia (2% to 5%), pruritus (2% to 5%)

Endocrine & metabolic: Hypercholesterolemia (9%), breast pain (2% to 8%)

Gastrointestinal: Constipation (7% to 9%), abdominal pain (7% to 9%), diarrhea (8% to 9%), anorexia (5% to 7%), xerostomia (6%), dyspepsia (7%), weight gain (2% to 9%), weight loss (2% to 5%)

Genitourinary: Urinary tract infection (2% to 8%), vulvovaginitis (6%), pelvic pain (5%), vaginal bleeding (1% to 5%), vaginitis (4%), vaginal discharge (4%), vaginal hemorrhage (2% to 4%), leukorrhea (2% to 3%), vaginal dryness (2%)

Hematologic: Anemia (2% to 5%), leukopenia (2% to 5%)

Hepatic: Liver function tests increased (2% to 5%), alkaline phosphatase increased (2% to 5%), gamma GT increased (2% to 5%)

Local: Thrombophlebitis (2% to 5%)

Neuromuscular & skeletal: Fracture (2% to 10%), arthrosis (7%), paresthesia (5% to 7%), joint disorder (6%), myalgia (2% to 6%), neck pain (2% to 5%), hypertonia (3%)

Ocular: Cataracts (6%)

Respiratory: Dyspnea (8% to 10%), sinusitis (2% to 6%), bronchitis (2% to 5%), rhinitis (2% to 5%)

Miscellaneous: Lymph edema (10%), infection (2% to 9%), flu-like syndrome (2% to 7%), diaphoresis (2% to 5%), cyst (5%), tumor flare (3%)

<1%, postmarketing, and/or case reports: Anaphylaxis, angioedema, CVA, cerebral ischemia, cerebral infarct, endometrial cancer, erythema multiforme, joint pain, joint stiffness, MI, myocardial ischemia, pulmonary embolus, retinal vein thrombosis, Stevens-Johnson syndrome, urticaria

Oncology: Emetic PotentialVery low (<10%)
Metabolism/Transport Effects**Inhibits** CYP1A2 (weak), 2C8 (weak), 2C9 (weak), 3A4 (weak)
Drug Interactions

Tamoxifen: May decrease the serum concentration of Anastrozole. *Risk D: Consider therapy modification*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Avoid black cohosh, hops, licorice, red clover, thyme, and dong quai.
Test InteractionsLab test abnormalities: GGT, AST, ALT, alkaline phosphatase, total cholesterol, and LDL increased; threefold elevations of mean serum GGT levels have been observed among patients with liver metastases. These changes were likely related to the progression of liver metastases in these patients, although other contributing factors could not be ruled out. Mean serum total cholesterol levels increased by 0.5 mmol/L among patients.
Monitoring ParametersBone mineral density; total cholesterol and LDL
Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents and herbal products patient may be taking (eg, tamoxifen and estrogens). Assess results of laboratory tests; may decrease bone mineral density and elevate serum cholesterol. Therapeutic effectiveness and adverse reactions (eg, hyperlipidemia, hypotension, CNS changes, thrombophlebitis, bone pain or fracture) should be assessed periodically during therapy. Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.
Monitoring: Lab TestsBone mineral density; total cholesterol and LDL
Patient EducationDo not take any new medication during therapy unless approved by prescriber. Take exactly as directed. Maintain adequate hydration (2-3 L/day of fluids) unless instructed to restrict fluid intake. May cause headache (consult prescriber for approved analgesic); drowsiness, dizziness, anxiety (use caution when driving or engaging in tasks that require alertness until response to drug is known); nausea or vomiting (small, frequent meals, frequent mouth care, chewing gum, or sucking lozenges may help); or increased pelvic, bone or tumor pain (may lessen with continued use; if not, consult prescriber for approved analgesic), or hot flashes (cool cloths may help). Report unresolved nausea or vomiting; pain or burning on urination; severe mood swings, confusion, anxiety; palpitations; swelling of extremities; unusual chest pain; flu-like symptoms; persistent bone or joint pain; respiratory difficulty; or other persistent adverse effects. **Pregnancy/breast-feeding precautions:** Do not get pregnant while taking this medication. Consult prescriber for appropriate contraceptive measures. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Tablet:

Arimidex®: 1 mg

Generic AvailableNo
ManufacturerAstraZeneca Pharmaceuticals LP
Pricing: U.S. (www.drugstore.com)

Tablets (Arimidex)

1 mg (30): $316.53

Mechanism of ActionPotent and selective nonsteroidal aromatase inhibitor. By inhibiting aromatase, the conversion of androstenedione to estrone, and testosterone to estradiol, is prevented. Anastrozole causes an 85% decrease in estrone sulfate levels.
Pharmacodynamics/Kinetics

Onset of estradiol reduction: 70% reduction after 24 hours; 80% after 2 weeks therapy

Duration of estradiol reduction: 6 days

Absorption: Well absorbed; not affected by food

Protein binding, plasma: 40%

Metabolism: Extensively hepatic (~85%) via N-dealkylation, hydroxylation, and glucuronidation; primary metabolite inactive

Half-life elimination: ~50 hours

Excretion: Urine (10% as unchanged drug; 60% as metabolites)

Related Information

- Safe Handling of Hazardous Drugs

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes upon discontinuation).

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusDrowsiness, confusion, insomnia, and anxiety are common

Mental Health: Effects on Psychiatric TreatmentNone reported

Anidulafungin

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(ay nid yoo la FUN jin)

U.S. Brand NamesEraxis™

Canadian Brand NamesEraxis™

Pharmacologic CategoryAntifungal Agent, Parenteral; Echinocandin

Use: Labeled IndicationsTreatment of candidemia and other forms of *Candida* infections (including those of intra-abdominal, peritoneal, and esophageal locus)

Use: Unlabeled/InvestigationalTreatment of infections due to *Aspergillus* spp.

Dosing: Adults

Candidemia, intra-abdominal or peritoneal candidiasis: I.V.: 200 mg loading dose on day 1, followed by 100 mg daily for at least 14 days after last positive culture

Esophageal candidiasis: I.V.: 100 mg loading dose on day 1, followed by 50 mg daily for at least 14 days and for at least 7 days after symptom resolution

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo adjustment necessary, including dialysis patients.

Dosing: Hepatic ImpairmentNo adjustment necessary.

Administration: I.V.For intravenous use only; infusion rate should not exceed 1.1 mg/minute

StorageStore between 15°C to 30°C (59°F to 86°F). Reconstituted and diluted solutions are stable for 24 hours at room temperature. Do not refrigerate or freeze.

ReconstitutionAseptically add 15 mL (50 mg vial) or 30 mL (100 mg vial) of companion diluent (20% w/w dehydrated alcohol in water for injection) to each vial. Swirl to dissolve; do not shake. Further dilute 50 mg, 100 mg, or 200 mg in 100 mL, 250 mL, or 500 mL, respectively, of D_5W or NS.

CompatibilityStable in D_5W, NS.

Y-site administration: Compatible: Acyclovir, amikacin, aminophylline, ampicillin-sulbactam, carboplatin, cefazolin, cefepime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, cimetidine, ciprofloxacin, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, daunorubicin, dexamethasone, digoxin, dobutamine, docetaxel, dopamine, doxorubicin, epinephrine, erythromycin, etoposide, famotidine, fentanyl, fluconazole, fluorouracil, furosemide, ganciclovir, gatifloxacin, gemcitabine, gentamicin, heparin, hydrocortisone, hydromorphone, ifosfamide, imipenem–cilastatin, leucovorin, levofloxacin, linezolid, meperidine, meropenem, methylprednisolone, metronidazole, midazolam, morphine, mycophenolate mofetil, norepinephrine, paclitaxel, pantoprazole, phenylephrine, piperacillin-tazobactam, potassium chloride, quinupristin–dalfopristin, ranitidine, sulfamethoxazole-trimethoprim, tacrolimus, ticarcillin, tobramycin, vancomycin, vincristine, voriconazole, zidovudine. **Incompatible:** Amphotericin B, ertapenem, sodium bicarbonate.

ContraindicationsHypersensitivity to anidulafungin, other echinocandins, or any component of the formulation

Allergy Considerations

- Echinocandin Allergy

Warnings/Precautions

Concerns related to adverse effects:

- Hepatic effects: Elevated liver function tests, hepatitis, and worsening hepatic failure have been reported; monitor for progressive hepatic impairment if increased transaminase enzymes noted.
- Histamine-mediated reactions: Histamine-mediated reactions (eg, urticaria, flushing, hypotension) have been observed; these may be related to infusion rate.

Disease-related concerns:

- Candidal infections: Safety and efficacy have not been established in other *Candida* infections (eg, endocarditis, osteomyelitis, meningitis).

Special populations:

- Neutropenic patients: Safety and efficacy have not been established in neutropenic patients.
- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorC

Pregnancy ConsiderationsSkeletal teratogenic effects were noted in animal studies. There are no adequate and well-controlled studies in pregnant women. Use only if benefit outweighs risk.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

2% to 10%:

Endocrine & metabolic: Hypokalemia (3%)

Gastrointestinal: Diarrhea (3%)

Hepatic: Transaminase increased (<1% to 2%)

<2%: Abdominal pain, alkaline phosphatase increased, amylase increased, angioneurotic edema, atrial fibrillation, back pain, bilirubin increased, bundle branch block (right), candidiasis, cholestasis, clostridial infection, coagulopathy, constipation, cough, CPK increased, creatinine increased, diaphoresis, diarrhea, dizziness, DVT, dyspepsia, ECG abnormality (including QT prolongation), erythema, eye pain, fecal incontinence, flushing, fungemia, GGT increased, headache, hepatic necrosis, hepatitis, hepatic dysfunction, hot flushes, hypercalcemia, hyperglycemia, hyperkalemia, hypernatremia, hyper-/hypotension, hypomagnesemia, infusion-related reaction, leukopenia (0.7%), lipase increased, nausea, neutropenia (1%), peripheral edema, phlebitis, platelet count increased, prothrombin time prolonged, pruritus, pyrexia, rash, rigors, seizure, sinus arrhythmia, thrombocytopenia, thrombophlebitis, urea increased, urticaria, ventricular extrasystoles, vision blurred, visual disturbance, vomiting

Drug Interactions

Saccharomyces boulardii: Antifungal Agents may diminish the therapeutic effect of Saccharomyces boulardii. *Risk D: Consider therapy modification*

Monitoring ParametersLiver function tests

Nursing: Physical Assessment/MonitoringAssess results of laboratory tests (liver function), therapeutic effectiveness, and adverse reactions on a regular basis during therapy. See Administration for I.V. specifics. Teach patient possible adverse symptoms to report.

Monitoring: Lab TestsLiver function tests

Patient EducationThis medication can only be administered by infusion. Report immediately any pain, burning, or swelling at infusion site, or any signs of allergic reaction (eg, respiratory difficulty or swallowing, back pain, chest tightness, rash, hives, or swelling of lips or mouth). Report diarrhea, nausea, vomiting, or abdominal pain. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Eraxis™: 50 mg [contains polysorbate 80; packaged with dehydrated alcohol as diluent]; 100 mg [contains polysorbate 80; packaged with dehydrated alcohol as diluent]

Generic AvailableNo

Mechanism of ActionNoncompetitive inhibitor of 1,3-beta-D-glucan synthase resulting in reduced formation of 1,3-beta-D-glucan, an essential polysaccharide comprising 30% to 60% of *Candida* cell walls (absent in mammalian cells); decreased glucan content leads to osmotic instability and cellular lysis

Pharmacodynamics/Kinetics

Distribution: 30-50 L

Protein binding: 84%

Metabolism: No hepatic metabolism observed; undergoes slow chemical hydrolysis to open-ring peptide-lacking antifungal activity

Half-life elimination: 27 hours

Excretion: Feces (30%, 10% as unchanged drug); urine (<1%)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsLY303366

International Brand NamesECALTA (IE, SE)

Anthralin

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(AN thra lin)
U.S. Brand NamesDritho-Scalp®; Psoriatec™
Canadian Brand NamesAnthraforte®; Anthranol®; Anthrascalp®; Micanol®
Pharmacologic CategoryAntipsoriatic Agent; Keratolytic Agent
Use: Labeled IndicationsTreatment of psoriasis (quiescent or chronic psoriasis)
Dosing: Adults

Psoriasis: Topical: Generally, apply once a day or as directed. The irritant potential of anthralin is directly related to the strength being used and each patient's individual tolerance. Always commence treatment using a short, daily contact time (5-10 minutes) for at least 1 week using the lowest strength possible. Contact time may be gradually increased (to 20-30 minutes) as tolerated.

Skin application: Apply sparingly only to psoriatic lesions and rub gently and carefully into the skin until absorbed. Avoid applying an excessive quantity which may cause unnecessary soiling and staining of the clothing or bed linen.

Scalp application: Comb hair to remove scalar debris, wet hair and, after suitably parting, rub cream well into the lesions, taking care to prevent the cream from spreading onto the forehead.

Note: Remove by washing or showering; optimal period of contact will vary according to the strength used and the patient's response to treatment. Continue treatment until the skin is entirely clear (ie, when there is nothing to feel with the fingers and the texture is normal).

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricUnlabeled use: Refer to adult dosing.
Administration: TopicalMay apply using latex gloves to prevent staining of fingers. Apply directly to plaques; rub in gently but thoroughly; avoid application to unaffected skin. When applying to scalp, part hair in one-inch segments to reach plaques. Remove by washing after conclusion of prescribed contact period. When rinsing, take care to avoid contact with eyes. Immediately clean tub or shower to prevent staining. Dry off using old towel (stains on fabric may be permanent). Petroleum jelly may be used around the edges of plaques, in body folds, or skin creases to prevent irritation of unaffected skin.
StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F). Avoid excessive heat.
ContraindicationsHypersensitivity to anthralin or any component of the formulation; acute psoriasis (acutely or actively inflamed psoriatic eruptions)
Warnings/Precautions

Concerns related to adverse effects:

- Redness: If redness is observed, reduce frequency of dosage or discontinue application.
- Staining: May stain skin, hair, fingernails (temporary), or fabrics (may be permanent).

Disease-related concerns:

- Renal impairment: Use with caution in patients with renal disease.

Special populations:

Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Appropriate application: Avoid eye contact; should generally not be applied to opposing skin surfaces that may rub or touch (eg, skin folds of the groin, axilla, and breasts) and high strengths should not be used on these sites; do not apply to genitalia.
- Prolonged/extensive use: Use with caution in patients extensive and prolonged applications.

Pregnancy Risk FactorC
LactationExcretion in breast milk unknown/not recommended
Adverse ReactionsFrequency not defined: Dermatologic: Transient primary irritation of uninvolved skin; temporary discoloration of skin, hair, and fingernails; contact allergic reactions; erythema
Drug InteractionsThere are no known significant interactions.
Nursing: Physical Assessment/MonitoringWhen applied to large areas of skin or for extensive periods of time, monitor for adverse skin or systemic reactions. Assess knowledge/teach patient appropriate application and use and adverse symptoms to report.
Patient EducationFor external use only. Use exactly as directed; do not overuse. Before using, wash and dry area gently. Wear gloves to apply a thin film to affected area and rub in gently. Remove by washing; may discolor fabric, skin, or hair. Use a porous dressing if necessary. For lesions on scalp, comb hair to remove scalar debris, part hair, and rub cream into lesions. Do not allow cream to spread to forehead or onto neck. Remove by washing hair. Avoid contact with eyes. Avoid exposing treated areas to direct sunlight; sunburn can occur. Optimal period of contact will vary according to strength used and response to treatment. Report increased swelling, redness, rash, itching, signs of infection, worsening of condition, or lack of healing. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant.

Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Cream:

Dritho-Scalp®: 0.5% (50 g)

Psoriatec™: 1% (50 g)

Anthrax Vaccine Adsorbed

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(AN thraks vak SEEN ad SORBED)

U.S. Brand NamesBioThrax™

Pharmacologic CategoryVaccine

Use: Labeled IndicationsImmunization against *Bacillus anthracis*. Recommended for individuals who may come in contact with animal products which come from anthrax endemic areas and may be contaminated with *Bacillus anthracis* spores; recommended for high-risk persons such as veterinarians and other handling potentially infected animals. Routine immunization for the general population is not recommended.

The Department of Defense is implementing an anthrax vaccination program against the biological warfare agent anthrax, which will be administered to all active duty and reserve personnel.

Use: Unlabeled/InvestigationalPostexposure prophylaxis in combination with antibiotics

Dosing: Adults

Primary immunization: SubQ: Three injections of 0.5 mL each given 2 weeks apart, followed by three additional injections given at 6-, 12-, and 18 months; it is not necessary to restart the series if a dose is not given on time; resume as soon as practical

Subsequent booster injections: SubQ: 0.5 mL at 1-year intervals are recommended for immunity to be maintained

Dosing: ElderlySafety and efficacy have not been established.

Dosing: PediatricRefer to adult dosing.

Administration: OtherAdminister SubQ; shake well before use. Do not use if discolored or contains particulate matter. Do not use the same site for more than one injection. Do not mix with other injections. After administration, massage injection site to disperse the vaccine. Federal law requires that the date of administration, the vaccine manufacturer, lot number of vaccine, and the administering person's name, title, and address be entered into the patient's permanent medical record.

StorageStore under refrigeration at 2°C to 8°C (36°F to 46°F). Do not freeze.

RestrictionsNot commercially available in the U.S.; presently, all anthrax vaccine lots are owned by the U.S. Department of Defense. The Centers for Disease Control (CDC) does not currently recommend routine vaccination of the general public.

ContraindicationsHypersensitivity to anthrax vaccine or any component of the formulation; severe anaphylactic reaction to a previous dose of anthrax vaccine; history of anthrax; history of Guillain-Barré syndrome; pregnancy

Warnings/Precautions

Concerns related to adverse effects:

- Anaphylactoid/hypersensitivity reactions: Immediate treatment (including epinephrine 1:1000) for anaphylactoid and/or hypersensitivity reactions should be available during vaccine use.
- Fever/chills: Discontinue immunization in patients with chills or fever associated with administration.

Disease-related concerns:

- Acute illness: May consider deferring administration in patients with moderate or severe acute illness (with or without fever); may administer to patients with mild acute illness (with or without fever).
- Guillain-Barré syndrome: Patients with a history of Guillain-Barré syndrome should not be given the vaccine unless there is a clear benefit that outweighs the potential risk of recurrence.

Special populations:

- Altered immunocompetence: Use with caution in severely immunocompromised patients (eg, patients receiving chemo/radiation therapy or other immunosuppressive therapy (including high dose corticosteroids)); may have a reduced response to vaccination.
- Elderly: Safety and efficacy have not been established in adults >65 years of age.
- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Latex: Packaging may contain natural latex rubber.

Pregnancy Risk FactorD

Pregnancy ConsiderationsReproduction studies have not been conducted. Use during pregnancy only if clearly needed. Unpublished data from the Department of Defense suggest the vaccine may be linked with an increased number of birth defects when given during pregnancy.

LactationExcretion in breast milk unknown/use caution

Breast-Feeding ConsiderationsThere are no adequate and well-controlled studies using this vaccine in breast-feeding women; however, the administration of nonlive vaccines during breast-feeding is generally not medically contraindicated.

Adverse Reactions(Includes pre- and postlicensure data; systemic reactions reported more often in women than in men)

>10%:

Central nervous system: Malaise (4% to 11%)

Local: Tenderness (58% to 71%), erythema (12% to 43%), subcutaneous nodule (4% to 39%), induration (8% to 21%), warmth (11% to 19%), local pruritus (7% to 19%)

Neuromuscular & skeletal: Arm motion limitation (7% to 12%)

1% to 10%:

Central nervous system: Headache (4% to 7%), fever (<1% to 7%)

Gastrointestinal: Anorexia (4%), vomiting (4%), nausea (<1% to 4%)

Local: Mild local reactions (edema/induration <30 mm) (9%), edema (8%)

Neuromuscular & skeletal: Myalgia (4% to 7%)

Respiratory: Respiratory difficulty (4%)

<1%: Chills, body aches, delayed hypersensitivity reaction (started approximately day 17), moderate local reactions (edema/induration >30 mm and <120 mm), severe local reactions (edema/induration >120 mm in diameter or accompanied by marked limitation of arm motion or marked axillary node tenderness)

Postmarketing and/or case reports: Anaphylaxis, angioedema, aplastic anemia, arthralgia, aseptic meningitis, asthma, atrial fibrillation, cardiomyopathy, cellulitis, cerebrovascular accident, CNS lymphoma, cysts, collagen vascular disease, dizziness, encephalitis, endocarditis, facial palsy, fatigue, glomerulonephritis, Guillain-Barré syndrome, hearing disorder, idiopathic thrombocytopenia purpura, immune deficiency, inflammatory arthritis, injection site pain/tenderness, leukemia, liver abscess, lymphoma, mental status change, multiple sclerosis, myocarditis, neutropenia, pemphigus vulgaris, peripheral swelling, polyarteritis nodosa, psychiatric disorders, renal failure, seizure, sepsis, spontaneous abortion, sudden cardiac arrest, suicide, syncope, transverse myelitis, tremor, systemic lupus erythematosus, visual disorder

Drug Interactions

Immunosuppressants: May diminish the therapeutic effect of Vaccines (Inactivated). *Risk C: Monitor therapy*

Monitoring ParametersMonitor for local reactions, chills, fever, anaphylaxis

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, suspension:

BioThrax™: *Bacillus anthracis* proteins (5 mL) [contains aluminum, natural rubber/natural latex in packaging]

Generic AvailableNo

ManufacturerBioport Corporation

Mechanism of ActionActive immunization against *Bacillus anthracis*. The vaccine is prepared from a cell-free filtrate of *B. anthracis*, but no dead or live bacteria.

Pharmacodynamics/KineticsDuration: Unknown; may be 1-2 years following two inoculations based on animal data

Pharmacotherapy PearlsNot commercially available in the U.S.

Local reactions increase in severity by the fifth dose. Moderate local reactions (>5 cm) may be pruritic and may occur if given to a patient with a previous history of anthrax infection. Federal law requires that the date of administration, the vaccine manufacturer, lot number of vaccine, and the administering person's name, title, and address be entered into the patient's permanent medical record.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay rarely produce malaise or fatigue

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsAVA

Anti-inhibitor Coagulant Complex

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(an tee-in HI bi tor coe AG yoo lant KOM pleks)
U.S. Brand NamesAutoplex® T [DSC]; Feiba VH
Canadian Brand NamesFeiba VH Immuno
Pharmacologic CategoryActivated Prothrombin Complex Concentrate (aPCC); Antihemophilic Agent; Blood Product Derivative
Use: Labeled IndicationsHemophilia A & B patients with factor VIII inhibitors who are to undergo surgery or those who are bleeding
Dosing: AdultsControl of bleeding: I.V.:

Autoplex® T: Dosage range: 25-100 factor VIII correctional units per kg depending on the severity of hemorrhage; may repeat in ~6 hours if needed. Adjust dose based on patient response.

Feiba VH: General dosing guidelines: 50-100 units/kg (maximum 200 units/kg)

Joint hemorrhage: 50 units/kg every 12 hours; may increase to 100 units/kg; continue until signs of clinical improvement occur

Mucous membrane bleeding: 50 units/kg every 6 hours; may increase to 100 units/kg (maximum: 2 administrations/day or 200 units/kg/day

Soft tissue hemorrhage: 100 units/kg every 12 hours (maximum: 200 units/kg/day)

Other severe hemorrhage: 100 units/kg every 12 hours; may be used every 6 hours if needed; continue until clinical improvement

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRefer to adult dosing.
Administration: I.V.

Autoplex® T: Initial rate of infusion: 2 mL/minute; may gradually increase to 10 mL/minute as tolerated. Infusion should be completed within 1 hour of reconstitution.

Feiba VH: Maximum infusion rate: 2 units/kg/minute. Following reconstitution, complete infusion within 3 hours.

Dietary ConsiderationsAutoplex® T contains sodium 162-192 mEq/L; Feiba VH contains sodium 8 mg/mL
StorageStore at 2°C to 8°C (36°F to 46°F); avoid freezing. Feiba VH may be stored at room temperature of 25˚C (77˚F) for up to 6 months prior to reconstitution; do not re-refrigerate.
ReconstitutionPrior to reconstitution, bring to room temperature. Reconstitute with provided SWI. Swirl to gently dissolve powder; do not shake vigorously. Do **not** refrigerate after reconstitution.
ContraindicationsHypersensitivity to any component of the formulation; disseminated intravascular coagulation (DIC); fibrinolysis; patients with normal coagulation mechanism
Warnings/Precautions

Concerns related to adverse effects:

- Thrombotic events: High doses of Feiba VH have been associated with thrombotic complications; single doses should not exceed 100 units/kg and daily doses should not exceed 200 units/kg. Use with caution in patients at risk for thrombotic events.

Disease-related concerns:

- Hepatic impairment: Use with extreme caution in patients with hepatic impairment.

Dosage form specific issues:

- Factor VIII: Products may contain minute amounts of factor VIII which may cause an anamnestic response.
- Human plasma: Product of human plasma; may potentially contain infectious agents which could transmit disease. Screening of donors, as well as testing and/or inactivation or removal of certain viruses, reduces the risk. Infections thought to be transmitted by this product should be reported to the manufacturer.
- Latex: Products may contain natural rubber latex.

Other warnings/precautions:

- Appropriate use: Identification of the clotting deficiency as caused by factor VIII inhibitors is essential prior to starting therapy. Tests used to control improvement, such as aPTT, WBCT, and TEG, do not correlate with clinical efficacy. Dosing to normalize these values may result in DIC.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Cardiovascular: Blood pressure changes, flushing, MI, pulse rate changes

Central nervous system: Headache, lethargy

Dermatologic: Rash, urticaria

Gastrointestinal: Nausea

Hematologic: DIC

Miscellaneous: Allergic reaction, anamnestic response, infusion-related reactions (fever, chills)

Drug Interactions

Antifibrinolytic Agents: May enhance the thrombogenic effect of Anti-inhibitor Coagulant Complex. *Risk D: Consider therapy modification*

Test InteractionsIncreased/decreased PT, increased/decreased PTT, decreased WBCT, decreased fibrin, decreased platelets, increased fibrin split products

Monitoring ParametersMonitor for control of bleeding; signs and symptoms of DIC (blood pressure changes, pulse rate changes, chest pain/cough, fibrinogen decreased, platelet count decreased, fibrin-fibrinogen degradation products, significantly-prolonged thrombin time, PT, or partial thromboplastin time); hypotension; have epinephrine ready to treat hypersensitivity reactions. **Note:** Tests used to control efficacy such as aPTT, WBCT, and TEG do not correlate with clinical improvement. Dosing to normalize these values may result in DIC.

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents patient may be taking that may affect coagulation or platelet function. Patient should be monitored closely during and after infusion for any change in vital signs, cardiac and CNS status, or hypersensitivity reactions (chills, fever, chest pain, respiratory difficulty). **Caution:** See Laboratory Monitoring. If hypotension develops, the rate of infusion should be slowed and prescriber notified. Provide patient education according to patient condition.

Monitoring: Lab TestsMonitor for control of bleeding; signs and symptoms of DIC (blood pressure changes, pulse rate changes, chest pain/cough, fibrinogen decreased, platelet count decreased, fibrin-fibrinogen degradation products, significantly-prolonged thrombin time, PT, or partial thromboplastin time); hypotension; have epinephrine ready to treat hypersensitivity reactions. **Note:** Tests used to control efficacy such as aPTT, WBCT, and TEG do not correlate with clinical improvement. Dosing to normalize these values may result in DIC.

Patient EducationThis medication can only be administered by infusion; you will be monitored during and after infusion. Report immediately any sudden onset headache, rash, chest or back pain, wheezing or respiratory difficulties, hives, itching, low-grade fever, stomach pain, or nausea/vomiting to prescriber. Wear identification indicating that you have a hemophilic condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Autoplex® T: Each bottle is labeled with correctional units of factor VIII [contains heparin 2 units/mL and sodium 162-192 mEq/L; packaging contains natural rubber latex] [DSC]

Feiba VH: Each bottle is labeled with Immuno units of factor VIII [heparin free; contains sodium 8 mg/mL; packaging contains natural rubber latex]

Generic AvailableNo

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsAICC; Coagulant Complex Inhibitor

Antihemophilic Factor (Human)

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(an tee hee moe FIL ik FAK tor HYU man)
U.S. Brand NamesHemofil M; Koāte®-DVI; Monarc-M™; Monoclate-P®
Canadian Brand NamesHemofil M
Pharmacologic Category[Antihemophilic Agent](); [Blood Product Derivative]()
Use: Labeled IndicationsPrevention and treatment of hemorrhagic episodes in patients with hemophilia A (classic hemophilia); perioperative management of hemophilia A; can be of significant therapeutic value in patients with acquired factor VIII inhibitors not exceeding 10 Bethesda units/mL
Dosing: Adults**Hemophilia:** I.V.: Individualize dosage based on coagulation studies performed prior to treatment and at regular intervals during treatment. In general, administration of factor VIII 1 int. unit/kg will increase circulating factor VIII levels by ~2 int. units/dL. (General guidelines presented; consult individual product labeling for specific dosing recommendations.)

Dosage based on desired factor VIII increase (%):

To calculate dosage needed based on desired factor VIII increase (%):

Body weight (kg) x 0.5 int. units/kg x desired factor VIII increase (%) = int. units factor VIII required

For example:

50 kg x 0.5 int. units/kg x 30 (% increase) = 750 int. units factor VIII

Dosage based on expected factor VIII increase (%):

It is also possible to calculate the **expected** % factor VIII increase:

(# int. units administered x 2%/int. units/kg) divided by body weight (kg) = expected % factor VIII increase

For example:

(1400 int. units x 2%/int. units/kg) divided by 70 kg = 40%

General guidelines:

Minor hemorrhage: 10-20 int. units/kg as a single dose to achieve FVIII plasma level ~20% to 40% of normal. Mild superficial or early hemorrhages may respond to a single dose; may repeat dose every 12-24 hours for 1-3 days until bleeding is resolved or healing achieved.

Moderate hemorrhage/minor surgery: 15-25 int. units/kg to achieve FVIII plasma level 30% to 50% of normal. If needed, may continue with a maintenance dose of 10-15 int. units/kg every 8-12 hours.

Major to life-threatening hemorrhage: Initial dose 40-50 int. units/kg, followed by a maintenance dose of 20-25 int. units/kg every 8-12 hours until threat is resolved, to achieve FVIII plasma level 80% to 100% of normal.

Major surgery: 50 int. units/kg given preoperatively to raise factor VIII level to 100% before surgery begins. May repeat as necessary after 6-12 hours initially and for a total of 10-14 days until healing is complete. Intensity of therapy may depend on type of surgery and postoperative regimen.

Bleeding prophylaxis: May be administered on a regular basis for bleeding prophylaxis. Doses of 24-40 int. units/kg 3 times/week have been reported in patients with severe hemophilia to prevent joint bleeding.

If bleeding is not controlled with adequate dose, test for presence of inhibitor. It may not be possible or practical to control bleeding if inhibitor titers are >10 Bethesda units/mL.

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRefer to adult dosing.
Administration: I.V.Over 5-10 minutes (maximum: 10 mL/minute). Infuse Monoclate-P® at 2 mL/minute.
StorageStore under refrigeration, 2°C to 8°C (36°F to 46°F); avoid freezing. Use within 3 hours of reconstitution. Do not refrigerate after reconstitution, precipitation may occur.

Hemofil M, Monarc-M™: May also be stored at room temperature not to exceed 30°C (86°F).

Koāte®-DVI; Monoclate-P®: May also be stored at room temperature of 25°C (77°F) for ≤6 months.

ReconstitutionIf refrigerated, the dried concentrate and diluent should be warmed to room temperature before reconstitution. Gently swirl or rotate vial after adding diluent; do not shake vigorously.
ContraindicationsHypersensitivity to any component of the formulation
Warnings/Precautions

Special populations:

- Blood types A, B, and AB: Contains trace amounts of blood groups A and B isohemagglutinins and when large or frequently repeated doses are given to individuals with blood groups A, B, and AB, the patient should be monitored for signs of progressive anemia and the possibility of intravascular hemolysis should be considered.

Dosage form specific issues:

- Albumin: Products vary by preparation method; final formulations contain human albumin.

- Human plasma: Product of human plasma; may potentially contain infectious agents which could transmit disease. Screening of donors, as well as testing and/or inactivation or removal of certain viruses, reduces the risk. Infections thought to be transmitted by this product should be reported to the manufacturer. Hepatitis B vaccination is recommended for all patients. Hepatitis A vaccination is also recommended for seronegative patients.

- Latex: Natural rubber latex is a component of Hemofil M and Monarc-M™ packaging.

- Mouse protein: Hemofil M, Monoclate-P®, and Monarc-M™ contain trace amounts of mouse protein.

- von Willebrand factor: Products contain naturally-occurring von Willebrand factor for stabilization, however efficacy has not been established for the treatment of von Willebrand disease.

Other warnings/precautions:

- Dose requirements: The dosage requirement will vary in patients with factor VIII inhibitors; optimal treatment should be determined by clinical response.

Geriatric ConsiderationsResponse in the elderly is not expected to differ from that of younger patients; dosage should be individualized.
Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted. Safety and efficacy in pregnant women have not been established. Use during pregnancy only if clearly needed. Parvovirus B19 or hepatitis A, which may be present in plasma-derived products, may affect a pregnant woman more seriously than nonpregnant women.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions<1%: Acute hemolytic anemia, AHF inhibitor development, allergic reactions (rare), anaphylaxis (rare), bleeding tendency increased, blurred vision, chest tightness, chills, fever, headache, hyperfibrinogenemia, jittery feeling, lethargy, nausea, somnolence, stinging at the infusion site, stomach discomfort, tingling, urticaria, vasomotor reactions with rapid infusion, vomiting
Drug InteractionsThere are no known significant interactions.
Monitoring ParametersHeart rate and blood pressure (before and during I.V. administration); AHF levels prior to and during treatment; in patients with circulating inhibitors, the inhibitor level should be monitored; hematocrit; monitor for signs and symptoms of intravascular hemolysis; bleeding
Reference RangeClassification of hemophilia; normal is defined as 1 int. unit/mL of factor VIII

Severe: Factor level <1% of normal

Moderate: Factor level 1% to 5% of normal

Mild: Factor level >5% to <40% of normal

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents patient may be taking that may affect coagulation or platelet function. Patient should be monitored closely during and after infusion for any change in vital signs, cardiac and CNS status, or hypersensitivity reactions (eg, chills, fever, chest pain, respiratory difficulty). Assess response (eg, results of laboratory tests [hematocrit and coagulation studies]), therapeutic effectiveness (bleeding and coagulation status), and adverse reactions (eg, bleeding or anemia). Provide patient education according to patient condition.
Monitoring: Lab TestsIn patients with circulating inhibitors, the inhibitor level should be monitored; hematocrit
Patient EducationThis medication can only be given intravenously. Report immediately any sudden-onset headache, rash, chest or back pain, wheezing or respiratory difficulties, hives, itching, low-grade fever, stomach pain, or nausea/vomiting to prescriber. Wear identification indicating that you have a hemophilic condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Hemofil M: Vial labeled with international units [contains albumin; derived from mouse proteins; packaging may contain natural rubber latex]

Koate®-DVI: ~250 int. units, ~500 int. units, ~1000 int. units [contains albumin]

Monarc-M™: Vial labeled with international units [contains albumin; derived from mouse proteins; packaging may contain natural rubber latex]

Monoclate-P®: ~250 int. units, ~500 int. units, ~1000 int. units, ~1500 int. units [contains albumin; derived from mouse proteins]

Generic AvailableYes
Mechanism of ActionProtein (factor VIII) in normal plasma which is necessary for clot formation and maintenance of hemostasis; activates factor X in conjunction with activated factor IX; activated factor X converts prothrombin to thrombin, which converts fibrinogen to fibrin, and with factor XIII forms a stable clot
Pharmacodynamics/KineticsHalf-life elimination: Mean: 8-27 hours
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsAHF (Human); Factor VIII (Human)

Special Alerts

ReFacto®: Product Availability - September 2008

ReFacto® will no longer be available after May 31, 2009. Wyeth has replaced it with Xyntha™ which is available as of September 2008.

Medication Safety IssuesConfusion may occur due to the omitting of "Factor VIII" from some product labeling. Review product contents carefully prior to dispensing any antihemophilic factor.

Pronunciation(an tee hee moe FIL ik FAK tor ree KOM be nant)

U.S. Brand NamesAdvate; Helixate® FS; Kogenate® FS; Recombinate; ReFacto®; Xyntha™

Canadian Brand NamesHelixate® FS; Kogenate®; Kogenate® FS; Recombinate; ReFacto®

Pharmacologic CategoryAntihemophilic Agent

Use: Labeled IndicationsPrevention and treatment of hemorrhagic episodes in patients with hemophilia A (classic hemophilia or congenital factor VIII deficiency); perioperative management of hemophilia A; can be of significant therapeutic value in patients with acquired factor VIII inhibitors ≤10 Bethesda units/mL; prophylaxis of joint bleeding and to reduce risk of joint damage in children with hemophilia A with no preexisting joint damage

Dosing: Adults**Hemophilia:** I.V.: Individualize dosage based on coagulation studies performed prior to treatment and at regular intervals during treatment. In general, administration of factor VIII 1 int. unit/kg will increase circulating factor VIII levels by ~2 int. units/dL. (General guidelines presented; consult individual product labeling for specific dosing recommendations.)

Dosage based on desired factor VIII increase (%):

To calculate dosage needed based on desired factor VIII increase (%):

[Body weight (kg) x desired factor VIII increase (%)] divided by 2%/int. units/kg = int. units factor VIII required

For example:

50 kg x 30 (% increase) divided by 2%/int. units/kg = 750 int. units factor VIII

Dosage based on expected factor VIII increase (%):

It is also possible to calculate the **expected** % factor VIII increase:

(# int. units administered x 2%/int. units/kg) divided by body weight (kg) = expected % factor VIII increase

For example:

(1400 int. units x 2%/int. units/kg) divided by 70 kg = 40%

General guidelines:

Minor hemorrhage: 10-20 int. units/kg as a single dose to achieve FVIII plasma level ~20% to 40% of normal. Mild superficial or early hemorrhages may respond to a single dose; may repeat dose every 12-24 hours for 1-3 days until bleeding is resolved or healing achieved.

Moderate hemorrhage/minor surgery: 15-30 int. units/kg to achieve FVIII plasma level 30% to 60% of normal. May repeat 1 dose at 12-24 hours if needed. Some products suggest continuing for ≥3 days until pain and disability are resolved

Major to life-threatening hemorrhage: Initial dose 40-50 int. units/kg followed by a maintenance dose of 20-25 int. units/kg every 8-24 hours until threat is resolved, to achieve FVIII plasma level 60% to 100% of normal.

Major surgery: 50 int. units/kg given preoperatively to raise factor VIII level to 100% before surgery begins. May repeat as necessary after 6-12 hours initially and for a total of 10-14 days until healing is complete. Intensity of therapy may depend on type of surgery and postoperative regimen.

Bleeding prophylaxis: May be administered on a regular basis for bleeding prophylaxis. Doses of 24-40 int. units/kg 3 times/week have been reported in patients with severe hemophilia to prevent joint bleeding.

If bleeding is not controlled with adequate dose, test for presence of inhibitor. It may not be possible or practical to control bleeding if inhibitor titers >10 Bethesda units/mL.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Hemophilia: Refer to adult dosing.

Joint bleeding prophylaxis (Kogenate® FS): 25 int. units/kg every other day

Administration: I.V.Infuse over 5-10 minutes (maximum: 10 mL/minute).

Advate: Infuse over ≤5 minutes (maximum: 10 mL/minute).

Kogenate® FS: Infuse over 1-15 minutes; based on patient tolerability

Xyntha™: Infuse over several minutes; adjust based on patient comfort. Do not admix or administer in same tubing as other medications.

Dietary ConsiderationsAdvate contains sodium 108 mEq/L; Helixate® FS and Kogenate® FS contain sodium 27-36 mEq/L; Recombinate contains sodium 180 mEq/L

StorageStore under refrigeration, 2°C to 8°C (36°F to 46°F); avoid freezing. Use within 3 hours of reconstitution. Do not refrigerate after reconstitution, a precipitation may occur.

Advate: May also be stored at room temperature for up to 6 months.

Helixate® FS, Kogenate® FS, ReFacto®, Xyntha™: May also be stored at room temperature (not to exceed 25°C [36°F]) up to 3 months; avoid prolonged exposure to light during storage.

Recombinate: May also be stored at room temperature, not to exceed 30˚C (86˚F).

ReconstitutionIf refrigerated, the dried concentrate and diluent should be warmed to room temperature before reconstitution. Gently agitate or rotate vial after adding diluent, do not shake vigorously.

ContraindicationsHypersensitivity to any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Antibody formation: The development of factor VIII antibodies has been reported with antihemophilic factors; monitor for signs of formation of antibodies to factor VIII; may occur at anytime but more common in young children with severe hemophilia.

- Hypersensitivity reactions: Allergic hypersensitivity reactions (including anaphylaxis) may occur; monitor.

Dosage form specific issues:

- Albumin: Recombinate is stabilized using human albumin.

- Bovine: Recombinate may contain bovine protein.

- Mouse/hamster protein: Advate, Helixate® FS, Kogenate® FS, Recombinate, ReFacto®, and Xyntha™ may contain trace amounts of mouse or hamster protein.

- Sucrose: Helixate® FS and Kogenate® FS are stabilized with sucrose.

- von Willebrand factor: Products contain naturally-occurring von Willebrand factor for stabilization, however efficacy has not been established for the treatment of von Willebrand disease.

Other warnings/precautions:

- Dose requirements: The dosage requirement will vary in patients with factor VIII inhibitors; optimal treatment should be determined by clinical response.

Geriatric ConsiderationsResponse in the elderly is not expected to differ from that of younger patients; dosage should be individualized.

Pregnancy Risk FactorC

Pregnancy ConsiderationsAnimal reproduction studies have not been conducted. Safety and efficacy in pregnant women has not been established. Use during pregnancy only if clearly needed.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsActual frequency may vary by product.

>1%:

Central nervous system: Chills, dizziness, fever, headache, pain

Dermatologic: Pruritus, rash, urticaria

Gastrointestinal: Diarrhea, nausea, taste perversion, vomiting

Hematologic: Hemorrhage

Local: Injection site pain, injection site inflammation, infusion site reaction

Neuromuscular & skeletal: Arthralgia, weakness

Respiratory: Cough, dyspnea, nasopharyngitis, pharyngolaryngeal pain

Miscellaneous: Catheter thrombosis, factor VIII inhibitor formation

≤1%, postmarketing, and/or case reports: Abdominal pain, adenopathy, allergic reactions, anaphylaxis, anemia, anorexia, arthralgia, AST increased, chest discomfort, chest pain, constipation, depersonalization, diaphoresis, edema, epistaxis, facial edema, facial flushing, factor VIII decreased, fatigue, fever, GI hemorrhage, hives, hot flashes, hypersensitivity reaction, hyper-/hypotension (slight), infection, joint swelling, lethargy, otitis media, pallor, paresthesia, restlessness, rhinitis, rigors, shortness of breath, somnolence, tachycardia, urinary tract infection, vasodilation, venous catheter access complications

Drug InteractionsThere are no known significant interactions.

Monitoring ParametersHeart rate and blood pressure (before and during I.V. administration); plasma factor VIII activity prior to and during treatment; development of factor VIII inhibitors; signs of bleeding

Reference RangeClassification of hemophilia; normal is defined as 1 int. unit/mL of factor VIII

Severe: Factor level <1% of normal

Moderate: Factor level 1% to 5% of normal

Mild: Factor level >5% to <40% of normal

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents patient may be taking that may affect coagulation or platelet function. Patient should be monitored closely during and after infusion for any change in vital signs, cardiac and CNS status, or hypersensitivity reactions (eg, chills, fever, chest pain, respiratory difficulty). Assess response (eg, results of laboratory tests [hematocrit and coagulation studies]), therapeutic effectiveness (bleeding and coagulation status), and adverse reactions (eg, bleeding or anemia). Provide patient education according to patient condition.

Monitoring: Lab TestsPlasma factor VIII activity; development of factor VIII inhibitors; hemoglobin, hematocrit

Patient EducationThis medication can only be given intravenously. Report immediately any sudden-onset headache, rash, chest or back pain, wheezing or respiratory difficulties, hives, itching, low-grade fever, stomach pain, or nausea/vomiting to prescriber. Wear identification indicating that you have a hemophilic condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution, recombinant [preservative free]:

Advate: 250 int. units, 500 int. units, 1000 int. units, 1500 int. units, 2000 int. units, 3000 int. units [plasma/albumin free; contains sodium 108 mEq/L, mannitol; derived from hamster or mouse proteins]

Helixate® FS: 250 int. units, 500 int. units, 1000 int. units [albumin free; contains sucrose 28 mg/vial, sodium 27-36 mEq/L, polysorbate 80; derived from hamster or mouse protein]

Kogenate® FS: 250 int. units, 500 int. units, 1000 int. units, 2000 int. units [albumin free; contains sucrose 28-56 mg/vial, sodium 27-36 mEq/L; derived from hamster or mouse protein]

Recombinate: 250 int. units, 500 int. units, 1000 int. units [contains human albumin, sodium 180 mEq/L; derived from bovine, hamster or mouse proteins; packaging contains natural rubber latex]

ReFacto®: 250 int. units, 500 int. units, 1000 int. units, 2000 int. units [contains sucrose; derived from hamster or mouse proteins]

Xyntha™: 250 int. units, 500 int. units, 1000 int. units, 2000 int. units [albumin free; contains sucrose, polysorbate 80; derived from hamster proteins]

Generic AvailableNo

Mechanism of ActionFactor VIII replacement, necessary for clot formation and maintenance of hemostasis. It activates factor X in conjunction with activated factor IX; activated factor X converts prothrombin to thrombin, which converts fibrinogen to fibrin, and with factor XIII forms a stable clot.

Pharmacodynamics/Kinetics

Distribution: V_{ss}: 0.36-0.57 dL/kg

Half-life elimination: Mean: 8-19 hours

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Taste perversion.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsAHF (Recombinant); Factor VIII (Recombinant); rAHF

Antihemophilic Factor/von Willebrand Factor Complex (Human)

Lexi-Drugs Online

English English

Jump To Field (Select Field Name)

Pronunciation(an tee hee moe FIL ik FAK tor von WILL le brand FAK tor KOM plex HYU man)

U.S. Brand NamesAlphanate® *[new formulation]*; Humate-P®

Canadian Brand NamesHumate-P®

Pharmacologic CategoryAntihemophilic Agent; Blood Product Derivative

Use: Labeled Indications

Prevention and treatment of hemorrhagic episodes in patients with hemophilia A (classical hemophilia) (Alphanate®, Humate-P®) or acquired factor VIII deficiency (Alphanate®)

Prophylaxis with surgical and/or invasive procedures in patients with von Willebrand disease (vWD) when desmopressin is either ineffective or contraindicated (Alphanate®)

Treatment of spontaneous or trauma-induced bleeding, as well as prevention of excessive bleeding during and after surgery, in patients with vWD (mild, moderate, or severe) where use of desmopressin is known or suspected to be inadequate (Humate-P®)

Dosing: Adults

Hemophilia A: I.V.: Individualize dosage based on coagulation studies performed prior to treatment and at regular intervals during treatment; in general, administration of factor VIII 1 int. unit/kg will increase circulating factor VIII levels by ~2 int. units/dL.

Minor hemorrhage: Loading dose: FVIII:C 15 int. units/kg to achieve FVIII:C plasma level ~30% of normal. If second infusion is needed, half the loading dose may be given once or twice daily for 1-2 days.

Moderate hemorrhage: Loading dose: FVIII:C 25 int. units/kg to achieve FVIII:C plasma level ~50% of normal; Maintenance: FVIII:C 15 int. units/kg every 8-12 hours for 1-2 days in order to maintain FVIII:C plasma levels at 30% of normal. Repeat the same dose once or twice daily for up to 7 days or until adequate wound healing.

Life-threatening hemorrhage/major surgery: Loading dose: FVIII:C 40-50 int. units/kg; Maintenance: FVIII:C 20-25 int. units/kg every 8 hours to maintain FVIII:C plasma levels at 80% to 100% of normal for 7 days. Continue same dose once or twice daily for another 7 days in order to maintain FVIII:C levels at 30% to 50% of normal.

von Willebrand disease (vWD): Treatment (Humate-P®): I.V.: Individualize dosage based on coagulation studies performed prior to treatment and at regular intervals during treatment; in general, administration of factor VIII1 int. unit/kg would be expected to raise circulating vWF:RCof ~5 int. units/dL

Type 1, mild (if desmopressin is not appropriate): Major hemorrhage:

Loading dose: vWF:RCof 40-60 int. units/kg

Maintenance dose: vWF:RCof 40-50 int. units/kg every 8-12 hours for 3 days, keeping vWF:RCof nadir >50%; follow with 40-50 int. units/kg daily for up to 7 days

Type 1, moderate or severe:

Minor hemorrhage: vWF:RCof 40-50 int. units/kg for 1-2 doses

Major hemorrhage:

Loading dose: vWF:RCof 50-75 int. units/kg

Maintenance dose: vWF:RCof 40-60 int. units/kg every 8-12 hours for 3 days to keep the vWF:RCof nadir >50%, then 40-60 int. units/kg daily for a total of up to 7 days

Types 2 and 3:

Minor hemorrhage: vWF:RCof 40-50 int. units/kg for 1-2 doses

Major hemorrhage:

Loading dose: vWF:RCof 60-80 int. units/kg

Maintenance dose: vWF:RCof 40-60 int. units/kg every 8-12 hours for 3 days, keeping the vWF:RCof nadir >50%; follow with 40-60 int. units/kg daily for a total of up to 7 days

von Willebrand disease (vWD): Surgery/procedure prophylaxis (except patients with type 3 undergoing major surgery) (Alphanate®): I.V.:

Preoperative dose: vWF:RCof 60 int. units /kg 1 hour prior to surgery

Maintenance dose: vWF:RCof 40-60 int. units/kg every 8-12 hours as clinically needed. May reduce dose after third postoperative day;

continue treatment until healing is complete. For minor procedures, maintain vWF of 40% to 50% during postoperative days 1-3; for major procedures maintain vWF of 40% to 50% for ≥3-7 days.

von Willebrand disease (vWD): Surgery/procedure prevention of bleeding (Humate-P®): I.V.:

Emergency surgery: Administer vWF:RCof 50-60 int units/kg; monitor trough coagulation factor levels for subsequent doses

Surgical management (nonemergency):

Loading dose calculation based on baseline target vWF:RCof: (Target peak vWF:RCof - Baseline vWF:RCof) x weight (in kg) / IVR = int. units vWF:RCof required. Administer loading dose 1-2 hours prior to surgery. **Note:** If IVR not available, assume 2 int. units/dL per int. units/kg of VWF:RCof product administered.

Target concentrations for vWF:RCof following loading dose:

Major surgery: 100 int. units/dL

Minor surgery: 50-60 int. units/dL

Maintenance dose: Initial: $^{1}/_{2}$ loading dose followed by dosing determined by target tough concentrations, generally every 8-12 hours. Patients with shorter half lives may require dosing every 6 hours.

Target maintenance trough vWF:RCof concentrations:

Major surgery: >50 int. units/dL for up to 3 days, followed by >30 int. units/dL for a minimum total treatment of 72 hours

Minor surgery: ≥30 int. units/dL for a minimum duration of 48 hours

Oral surgery: ≥30 int. units/dL for a minimum duration of 8-12 hours

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Hemophilia A and vWD treatment: Refer to adult dosing.

von Willebrand disease (vWD) surgery/procedure prophylaxis (except patients with type 3 undergoing major surgery) (Alphanate®): I.V.:

Preoperative dose: vWF:RCof 75 int. units /kg 1 hour prior to surgery

Maintenance dose: vWF:RCof 50-75 int. units/kg every 8-12 hours as clinically needed. May reduce dose after third postoperative day; continue treatment until healing is complete.

Administration: I.V.

Alphanate®: Infuse slowly (maximum rate 10 mL/minute)

Humate-P®: Infuse slowly (maximum rate 4 mL/minute)

Storage

Alphanate®: Store under refrigeration, 2°C to 8°C (36°F to 46°F); avoid freezing. May also be stored at room temperature (not to exceed 30˚C/86˚F) for ≤2 months. Use as soon as possible after reconstitution.

Humate-P®: Store unopened vials at ≤25°C (≤77°F) until expiration date on label; avoid freezing. Use within 3 hours of reconstitution. Do not refrigerate after reconstitution, precipitation may occur.

ReconstitutionIf refrigerated, the dried concentrate and diluent should be warmed to room temperature before reconstitution. Gently swirl or rotate vial after adding diluent; do not shake vigorously. Use provided filter spike to withdraw solution from vial; remove filter spike prior to administration.

ContraindicationsHistory of anaphylactic or severe systemic response to antihemophilic factor or von Willebrand factor formulations; hypersensitivity to any component of the formulation

Warnings/Precautions

Concerns related to adverse effects:

- Antibody formation: The development of factor VIII antibodies has been reported with antihemophilic factor preparations; the risk of developing alloantibodies to von Willebrand factor is not known.
- Thrombotic events: Risk of thromboembolic events may be increased; use with caution when treating vWD in patients with risk factors for thrombosis. Incidence of thrombosis may be increased in females.

Special populations:

- Blood types A, B, and AB: Contains trace amounts of blood groups A and B isohemagglutinins and when large or frequently repeated doses are given to individuals with blood groups A, B, and AB, the patient should be monitored for signs of progressive anemia and the possibility of intravascular hemolysis should be considered.

Dosage form specific issues:

- Alphanate®: Not approved for use in patients with type 3 vWD (severe) undergoing major surgery.
- Human plasma: Product of human plasma; may potentially contain infectious agents which could transmit disease. Screening of donors,

as well as testing and/or inactivation or removal of certain viruses, reduces the risk. Infections thought to be transmitted by this product should be reported to the manufacturer. Strongly consider hepatitis A and B vaccination.

Other warnings/precautions:

- Dose requirements: The dosage requirement will vary in patients with factor VIII inhibitors; optimal treatment should be determined by clinical response.

Geriatric ConsiderationsResponse in the elderly is not expected to differ from that of younger patients; dosage should be individualized.
Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted. Safety and efficacy in pregnant women have not been established. Use during pregnancy only if clearly needed. Parvovirus B19 or hepatitis A, which may be present in plasma-derived products, may affect a pregnant woman more seriously than nonpregnant women.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsFrequency not defined.

Cardiovascular: Cardiorespiratory arrest, chest tightness, edema, femoral venous thrombosis, flushing, hypervolemia, orthostatic hypotension, shock, thromboembolic events, vasodilation

Central nervous system: Chills, dizziness, fever, headache, lethargy, pain, seizure, somnolence

Dermatologic: Itching, pruritus, rash, urticaria

Endocrine & metabolic: Parotid gland swelling

Gastrointestinal: Nausea, vomiting

Hematologic: Hematocrit decreased (moderate), hemorrhage, hemolysis, pseudothrombocytopenia (severe)

Hepatic: ALT increased

Local: Injection site stinging, phlebitis

Neuromuscular & skeletal: Extremity pain, joint pain, paresthesia, rigors

Respiratory: Dyspnea, pharyngitis, pulmonary embolus (large doses)

Miscellaneous: Allergic reactions, anaphylactic reactions, factor VIII inhibitor formation

Drug InteractionsThere are no known significant interactions.
Monitoring ParametersHeart rate and blood pressure (before and during I.V. administration); AHF levels prior to and during treatment; in patients with circulating inhibitors, the inhibitor level should be monitored; hematocrit; monitor for signs and symptoms of intravascular hemolysis; bleeding; vWF activity [circulating levels of functional vWF are measured as ristocetin cofactor activity (vWF:RCof)]. In surgical patients, monitor vWF:RCof at baseline and after surgery, trough vWF:RCof and FVIII:C at least daily.
Reference Range

Classification of hemophilia; normal is defined as 1 int. unit/mL of factor VIII:C

Severe: Factor level <1% of normal

Moderate: Factor level 1% to 5% of normal

Mild: Factor level >5% to <40% of normal

Classification of von Willebrand disease

Severe forms: vWF:RCof <10 units/dL and factor VIII:C <20 units/dL

Moderate forms: vWF:RCof 10-30 units/dL and factor VIII:C 20-40 units/dL

Mild forms: vWF:RCof 30-50 units/dL and factor VIII:C 40-60 units/dL

Note: Circulating levels of functional VWF are measured as ristocetin cofactor activity (vWF:RCof)]

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents patient may be taking that may affect coagulation or platelet function. Patient should be monitored closely during and after infusion for any change in vital signs, cardiac and CNS status, or hypersensitivity reactions (eg, chills, fever, chest pain, respiratory difficulty). Assess response (eg, results of laboratory tests [hematocrit and coagulation studies]), therapeutic effectiveness (bleeding and coagulation status), and adverse reactions (eg, bleeding or anemia). Provide patient education according to patient condition.
Monitoring: Lab TestsAHF levels prior to and during treatment; in patients with circulating inhibitors, the inhibitor level should be monitored; hematocrit; monitor for signs and symptoms of intravascular hemolysis; bleeding; vWF activity [circulating levels of functional vWF are measured as ristocetin cofactor activity (vWF:RCof)]. In surgical patients, monitor vWF:RCof at baseline and after surgery, trough vWF:RCof and FVIII:C at least daily.
Patient EducationThis medication can only be given intravenously. Report immediately any sudden-onset headache, rash, chest or back pain, wheezing or respiratory difficulties, hives, itching, low-grade fever, stomach pain, or nausea/vomiting to prescriber. Wear identification indicating that you have a hemophilic condition. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [human derived]:

Alphanate®:

- 250 int. units [Factor VIII and vWF:RCof ratio varies by lot; contains sodium ≥10 mEq/vial, albumin and polysorbate 80; packaged with diluent]
- 500 int. units [Factor VIII and vWF:RCof ratio varies by lot; contains sodium ≥10 mEq/vial, albumin and polysorbate 80; packaged with diluent]
- 1000 int. units [Factor VIII and vWF: RCof ratio varies by lot; contains sodium ≥10 mEq/vial, albumin and polysorbate 80; packaged with diluent]
- 1500 int. units [Factor VIII and vWF:RCof ratio varies by lot; contains sodium ≥10 mEq/vial, albumin and polysorbate 80; packaged with diluent]

Humate-P®:

- FVIII 250 int. units and vWF:RCof 600 int. units [contains albumin; packaged with diluent]
- FVIII 500 int. units and vWF:RCof 1200 int. units [contains albumin; packaged with diluent]
- FVIII 1000 int. units and vWF:RCof 2400 int. units [contains albumin; packaged with diluent]

Generic Available No

Mechanism of Action Factor VIII and von Willebrand factor (vWF), obtained from pooled human plasma, are used to replace endogenous factor VIII and vWF in patients with hemophilia or vWD. Factor VIII in conjunction with activated factor IX, activates factor X which converts prothrombin to thrombin and fibrinogen to fibrin. vWF promotes platelet aggregation and adhesion to damaged vascular endothelium and acts as a stabilizing carrier protein for factor VIII. [Circulating levels of functional vWF are measured as ristocetin cofactor activity (vWF:RCof)]

Pharmacodynamics/Kinetics

Duration: vWD: Shortening of bleeding time sustained 22-26 hours postinfusion

Distribution: V_d: vWF:RCof: 53-59 mL/kg

Half-life elimination:

- Factor VIII coagulant activity (FVIII:C): 8-28 hours in patients with hemophilia A
- vWF:RCof: 3-34 hours in patients with vWD

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment None reported

Index TermsAHF (Human); Factor VIII (Human); FVIII/vWF; vWF:RCof

English

Jump To Field (Select Field Name)

Pronunciation(an tee PYE reen & BEN zoe kane)

U.S. Brand NamesA/B Otic; Allergen®; Aurodex

Canadian Brand NamesAuralgan®

Pharmacologic CategoryOtic Agent, Analgesic; Otic Agent, Cerumenolytic

Use: Labeled IndicationsTemporary relief of pain and reduction of swelling associated with acute congestive and serous otitis media, swimmer's ear, otitis externa; facilitates ear wax removal

Dosing: Adults

Pain and swelling associated with otitis media, swimmer's ear, otitis externa: Otic: Fill ear canal with solution; moisten cotton pledget with solution, place in external ear, repeat every 1-2 hours until pain and congestion are relieved

Ear wax removal: Otic: Instill drops 3-4 times/day for 2-3 days

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

Administration: OtherOtic: Otitis media: Fill ear canal with solution. Moisten cotton pledget with solution and place in external ear. Avoid touching ear with dropper. Do not rinse dropper after use.

StorageStore at controlled room temperature of 15°C to 30°C (59°F to 86°F). Protect from light and heat. Do not use if brown or contains a precipitate. Discard 6 months after placing dropper into solution.

ContraindicationsHypersensitivity to antipyrine, benzocaine, or any component of the formulation; perforated tympanic membrane

Warnings/Precautions

Concerns related to adverse effects:

- Irritation: Discontinue if sensitization or irritation occur.

Other warnings/precautions:

- Appropriate use: For otic use only, do not apply to eyes.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted with this combination.

LactationExcretion in breast milk unknown/use caution

Adverse ReactionsPostmarketing and/or case reports: Methemoglobinemia (rare with topical benzocaine)

Drug InteractionsThere are no known significant interactions.

Patient EducationFor the ear. Discard bottle 6 months after opening.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, otic [drops]: Antipyrine 5.4% and benzocaine 1.4% (10 mL)

A/B Otic, Allergen®, Aurodex: Antipyrine 5.4% and benzocaine 1.4% (15 mL)

Generic AvailableYes

Pricing: U.S. (www.drugstore.com)

Solution (A/B Otic)

1.4-5.4% (15): $11.99

Solution (Antipyrine-Benzocaine)

5.4-1.4% (10): $12.99

Mechanism of ActionAntipyrine has analgesic properties; benzocaine is a local anesthetic; the glycerin base provides decreased middle ear pressure by osmosis.

Pharmacodynamics/KineticsOnset: Pain relief: ~30 minutes

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsBenzocaine and Antipyrine

Antithrombin III

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(an tee THROM bin three)
U.S. Brand NamesThrombate III®
Canadian Brand NamesThrombate III®
Pharmacologic CategoryAnticoagulant; Blood Product Derivative
Use: Labeled IndicationsTreatment of hereditary antithrombin III deficiency in connection with surgical procedures, obstetrical procedures, or thromboembolism
Use: Unlabeled/InvestigationalAcquired antithrombin III deficiencies related to disseminated intravascular coagulation (DIC)
Dosing: Adults**Antithrombin III deficiency:**

Initial dose: Dosing is individualized based on pretherapy AT-III levels. The initial dose should raise antithrombin III levels (AT-III) to 120% and may be calculated based on the following formula:

[desired AT-III level % - baseline AT-III level %] x body weight (kg)

divided by 1.4%/int. units/kg

For example, if a 70 kg adult patient had a baseline AT-III level of 57%, the initial dose would be

[(120% - 57%) x 70] divided by 1.4 = 3150 int. units

Maintenance dose: Subsequent dosing should be targeted to keep levels between 80% to 120% which may be achieved by administering 60% of the initial dose every 24 hours. Adjustments may be made by adjusting dose or interval. Maintain level within normal range for 2-8 days depending on type of procedure.

Dosing: ElderlyRefer to adult dosing.
Administration: I.V.Infuse over 10-20 minutes.
Administration: I.V. DetailpH: 6-7.5
Dietary ConsiderationsContains sodium 110-210 mEq/L
StorageStore vials under refrigeration at 2°C to 8°C (36°F to 46°F); avoid freezing. Bring drug and diluent to room temperature prior to reconstitution. Administer within 3 hours of mixing.
ReconstitutionReconstitute with sterile water for injection. Do not shake; swirl to mix to avoid foaming. Filter through sterile filter needle provided prior to administration.
ContraindicationsHypersensitivity to any component of the formulation
Warnings/Precautions

Concerns related to adverse effects:

- Infections: Product of human plasma; may potentially contain infectious agents which could transmit disease; screening of donors, as well as testing and/or inactivation or removal of certain viruses, reduces this risk. Infections thought to be transmitted by this product should be reported to Talecris Biotherapeutics at 1-800-520-2807.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorB
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. Although FDA indicated for obstetrical procedures, there are no adequate and well-controlled studies in pregnant women.
LactationExcretion in breast milk unknown/use caution
Adverse Reactions

1% to 10%: Central nervous system: Dizziness (2%)

<1%: Bowel fullness, chest pain, chest tightness, chills, cramps, dyspnea, fever, film over eye, foul taste, hematoma, hives, lightheadedness, nausea

Drug Interactions

Anticoagulants: May enhance the anticoagulant effect of other Anticoagulants. *Risk C: Monitor therapy*

Antiplatelet Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Dasatinib: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Drotrecogin Alfa: Antithrombin III may enhance the adverse/toxic effect of Drotrecogin Alfa. Bleeding may occur. *Risk D: Consider therapy modification*

Herbs (Anticoagulant/Antiplatelet Properties) (eg, Alfalfa, Anise, Bilberry): May enhance the adverse/toxic effect of Anticoagulants. Bleeding may occur. *Risk D: Consider therapy modification*

Ibritumomab: Anticoagulants may enhance the adverse/toxic effect of Ibritumomab. Both agents may contribute to an increased risk of bleeding. *Risk C: Monitor therapy*

Nonsteroidal Anti-Inflammatory Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Pentosan Polysulfate Sodium: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the adverse/toxic effect of Anticoagulants. Specifically, the antiplatelet effects of these agents may lead to an increased risk of bleeding with the combination. *Risk C: Monitor therapy*

Salicylates: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Thrombolytic Agents: May enhance the anticoagulant effect of Anticoagulants. *Risk C: Monitor therapy*

Tositumomab and Iodine I 131 Tositumomab: Anticoagulants may enhance the adverse/toxic effect of Tositumomab and Iodine I 131 Tositumomab. Specifically, the risk of bleeding-related adverse effects may be increased. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb InteractionsHerb/Nutraceutical: Recent use/intake of herbs with anticoagulant or antiplatelet activity (including cat's claw, dong quai, evening primrose, garlic, ginkgo and ginseng) may increase the risk of bleeding.

Monitoring ParametersMonitor antithrombin III peak and trough levels (preinfusion and 20 minutes postinfusion) for each dose and monitor levels 12 hours after initial loading dose; liver function tests; monitor antithrombin III levels in neonates of parents with hereditary antithrombin III deficiency immediately after birth

Reference RangeMaintain antithrombin III level in plasma >80%; plasma AT-III levels are ~60% lower near term infants than levels observed in adults; premature infants may have levels lower than other neonates.

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking (especially drugs affecting coagulation and platelet activity). Vital signs, cardiac status, and CNS status should be monitored during and after therapy. If tachycardia develops, infusion should be discontinued and prescriber notified.

Monitoring: Lab TestsMonitor antithrombin III peak and trough levels (preinfusion and 20 minutes postinfusion) for each dose and monitor levels 12 hours after initial loading dose; liver function tests; monitor antithrombin III levels in neonates of parents with hereditary antithrombin III deficiency immediately after birth

Patient EducationThis medication can only be given intravenously. Report immediately any sudden onset headache; rash, itching, or hives; chest or back pain; dizziness (use caution when rising from sitting or lying position, climbing stairs, driving, or engaging in tasks requiring alertness until response to drug is known); or wheezing or respiratory difficulties. Wear identification indicating that you have an antithrombin III deficiency. **Breast-feeding precautions:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution [preservative free]:

Thrombate III®: 500 int. units, 1000 int. units [contains heparin, sodium chloride 110-210 mEq/L; packaged with diluent]

Generic AvailableNo

Mechanism of ActionAntithrombin III is the primary physiologic inhibitor of *in vivo* coagulation. It is an alpha$_2$-globulin. Its principal actions are the inactivation of thrombin, plasmin, and other active serine proteases of coagulation, including factors IXa, Xa, XIa, and XIIa. The inactivation of proteases is a major step in the normal clotting process. The strong activation of clotting enzymes at the site of every bleeding injury facilitates fibrin formation and maintains normal hemostasis. Thrombosis in the circulation would be caused by active serine proteases if they were not inhibited by antithrombin III after the localized clotting process.

Pharmacodynamics/KineticsHalf-life elimination: Biologic: 2.5 days (immunologic assay); 3.8 days (functional AT-III assay). Half-life may be decreased following surgery, with hemorrhage, acute thrombosis, and/or during heparin administration.

Pharmacotherapy PearlsThromboembolism has been reported in children of women with hereditary antithrombin III (AT-III) deficiency; AT-III levels in neonates of parents with hereditary AT-III deficiency should be measured immediately after birth. Plasma AT-III levels are typically lower in neonates and infants than in adults. Low plasma AT-III levels in neonates may not be indicative of deficiency; consultation with a coagulation expert is recommended.

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusNone reported

Mental Health: Effects on Psychiatric TreatmentNone reported

Index TermsAT-III; Heparin Cofactor I

Medication Safety Issues

Sound-alike/look-alike issues:

Atgam® may be confused with Ativan®

Pronunciation(an te THY moe site GLOB yu lin, E kwine)

U.S. Brand NamesAtgam®

Canadian Brand NamesAtgam®

Pharmacologic Category[Immune Globulin](); [Immunosuppressant Agent]()

Use: Labeled IndicationsPrevention and treatment of acute renal allograft rejection; treatment of moderate to severe aplastic anemia in patients not considered suitable candidates for bone marrow transplantation

Use: Unlabeled/InvestigationalPrevention and treatment of other solid organ allograft rejection; prevention of graft-versus-host disease following bone marrow transplantation

Dosing: Adults**Note:** An intradermal skin test is recommended prior to administration of the initial dose of ATG; use 0.1 mL of a 1:1000 dilution of ATG in normal saline. A positive skin reaction consists of a wheal ≥10 mm in diameter. If a positive skin test occurs, the first infusion should be administered in a controlled environment with intensive life support immediately available. A systemic reaction precludes further administration of the drug. The absence of a reaction does **not** preclude the possibility of an immediate sensitivity reaction.

Note: Premedication with diphenhydramine, hydrocortisone, and is recommended prior to first dose.

Aplastic anemia protocol: I.V.: 10-20 mg/kg/day for 8-14 days, then give every other day for 7 more doses for a total of 21 doses in 28 days.

Renal allograft rejection, prevention: I.V.: 15 mg/kg/day for 14 days, then give every other day for 7 more doses for a total of 21 doses in 28 days; initial dose should be administered within 24 hours before or after transplantation.

Renal allograft rejection, treatment: I.V.: 10-15 mg/kg/day for 14 days, then give every other day for 7 more doses.

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric**Note:** See adult dosing for notes on intradermal skin testing and premedication.

Aplastic anemia protocol: I.V.: 10-20 mg/kg/day for 8-14 days; then administer every other day for 7 more doses; addition doses may be given every other day for 21 total doses in 28 days.

Renal allograft: I.V.: 5-25 mg/kg/day

Administration: I.V.Infuse dose over at least 4 hours. Any severe systemic reaction to the skin test, such as generalized rash, tachycardia, dyspnea, hypotension, or anaphylaxis, should preclude further therapy. Epinephrine and resuscitative equipment should be nearby. Patient may need to be pretreated with an antipyretic, antihistamine, and/or corticosteroid. Mild itching and erythema can be treated with antihistamines. Infuse into a vascular shunt, arterial venous fistula, or high-flow central vein through a 0.2-1 micron in-line filter.

First dose: Premedicate with diphenhydramine orally 30 minutes prior to and hydrocortisone I.V. 15 minutes prior to infusion and acetaminophen 2 hours after start of infusion.

StorageAmpuls must be refrigerated; do not freeze. Diluted solution is stable for 24 hours (including infusion time) at refrigeration.

ReconstitutionDilute into inverted bottle of sterile vehicle to ensure that undiluted lymphocyte immune globulin does not contact air. Gently rotate or swirl to mix. Final concentration should be 4 mg/mL. May be diluted in NS, $D_5$1/4NS, $D_5$1/2NS.

ContraindicationsHypersensitivity to lymphocytic immune globulin, any component of the formulation, or other equine gamma globulins

Warnings/Precautions

Boxed warnings:

- Experienced physician: See "Other warnings/precautions" below.

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: Hypersensitivity and anaphylactic reactions can occur; immediate treatment (including epinephrine 1:1000) should be available. Rash, dyspnea, hypotension, or anaphylaxis precludes further administration of the drug.

- Leukopenia: Discontinue if severe and unremitting leukopenia occurs.

- Thrombocytopenia: Discontinue if severe and unremitting thrombocytopenia occurs.

Other warnings/precautions:

- Administration: Must be administered via central line due to chemical phlebitis. Dose must be administered over at least 4 hours; patient may need to be pretreated with an antipyretic, antihistamine, and/or corticosteroid.

- Experienced physician: **[U.S. Boxed Warning]: Should only be used by physicians experienced in immunosuppressive therapy or management of solid organ or bone marrow transplant patients. Adequate laboratory and supportive medical resources must be readily available in the facility for patient management.**

- Skin testing: Intradermal skin testing is recommended prior to first-dose administration.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted; use during pregnancy is not recommended. Women exposed to Atgam® during pregnancy may be enrolled in the National Transplantation Pregnancy Registry (877-955-6877).

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Central nervous system: Fever, chills

Dermatologic: Pruritus, rash, urticaria

Hematologic: Leukopenia, thrombocytopenia

1% to 10%:

Cardiovascular: Bradycardia, chest pain, CHF, edema, encephalitis, hyper-/hypotension, myocarditis, tachycardia

Central nervous system: Agitation, headache, lethargy, lightheadedness, listlessness, seizure

Gastrointestinal: Diarrhea, nausea, stomatitis, vomiting

Hepatic: Hepatosplenomegaly, liver function tests abnormal

Local: Pain at injection site, phlebitis, thrombophlebitis, burning soles/palms

Neuromuscular & skeletal: Myalgia, back pain, arthralgia

Ocular: Periorbital edema

Renal: Abnormal renal function tests

Respiratory: Dyspnea, respiratory distress

Miscellaneous: Anaphylaxis, serum sickness, viral infection, night sweats, diaphoresis, lymphadenopathy

<1%: Dizziness, epigastric pain, faintness, herpes simplex reactivation, hiccups, hyperglycemia, iliac vein obstruction, infection, laryngospasm, malaise, paresthesia, pulmonary edema, renal artery thrombosis, serum sickness, toxic epidermal necrosis, weakness, wound dehiscence

Postmarketing and/or case reports: Acute renal failure, anemia, aplasia, confusion, cough, deep vein thrombosis, disorientation, GI bleeding, granulocytopenia, hemolysis, kidney enlarged, neutropenia, nosebleed, pancytopenia, vasculitis

Oncology: VesicantNo

Oncology: Emetic PotentialVery low (<10%)

Drug Interactions

Vaccines (Live): Immune Globulins may diminish the therapeutic effect of Vaccines (Live). **Exceptions:** Influenza Virus Vaccine; Yellow Fever Vaccine. *Risk D: Consider therapy modification*

Monitoring ParametersLymphocyte profile, CBC with differential and platelet count, vital signs during administration

Nursing: Physical Assessment/MonitoringAssess for history of previous allergic reactions. Monitor vital signs during infusion and observe for adverse or allergic reactions. Teach patient adverse symptoms to report.

Monitoring: Lab TestsLymphocyte profile, CBC with differential, platelet count

Patient EducationThis medication can only be administered by infusion. You will be closely monitored during the infusion. Do not get up alone; ask for assistance if you must get up or change position. Do not have any vaccinations for the next 3 months without consulting prescriber. Immediately report chills; persistent dizziness or nausea; itching or stinging; acute back pain; chest pain, tightness, or rapid heartbeat; or respiratory difficulty. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Atgam®: 50 mg/mL (5 mL)

Generic AvailableNo

Mechanism of ActionMay involve elimination of antigen-reactive T lymphocytes (killer cells) in peripheral blood or alteration of T-cell function

Pharmacodynamics/Kinetics

Distribution: Poorly into lymphoid tissues; binds to circulating lymphocytes, granulocytes, platelets, bone marrow cells

Half-life elimination, plasma: 1.5-12 days

Excretion: Urine (~1%)

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Stomatitis

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause malaise

Mental Health: Effects on Psychiatric TreatmentLeukopenia is common; use caution with clozapine and carbamazepine

Index TermsAntithymocyte Immunoglobulin; ATG; Horse Antihuman Thymocyte Gamma Globulin; Lymphocyte Immune Globulin

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(an te THY moe site GLOB yu lin RAB bit)

U.S. Brand NamesThymoglobulin®

Pharmacologic CategoryImmune Globulin; Immunosuppressant Agent

Use: Labeled IndicationsTreatment of acute rejection of renal transplant; used in conjunction with concomitant immunosuppression

Use: Unlabeled/InvestigationalInduction therapy in renal transplant

Dosing: AdultsTreatment of acute rejection: I.V.: 1.5 mg/kg/day for 7-14 days

Dosing: ElderlyRefer to adult dosing.

Dosing: PediatricRefer to adult dosing.

Dosing: Adjustment for Toxicity

WBC count 2000-3000 cells/mm^3 or platelet count 50,000-75,000 cells/mm^3: Reduce dose by 50%

WBC count <2000 cells/mm^3 or platelet count <50,000 cells/mm^3: Consider discontinuing treatment

Administration: I.V.The first dose should be infused over at least 6 hours through a high-flow vein. Subsequent doses should be administered over at least 4 hours. Administer through an in-line 0.22 micron filter. Premedication with corticosteroids, acetaminophen, and/or an antihistamine may reduce infusion-related reactions.

StorageStore powder under refrigeration at 2°C to 8°C (36°F to 46°F); do not freeze. Protect from light. Use immediately following reconstitution.

ReconstitutionAllow vials to reach room temperature, then reconstitute each vial with SWFI 5 mL. Rotate vial gently until dissolved. Prior to administration, further dilute one vial in 50 mL saline or dextrose (total volume is usually 50-500 mL depending on total number of vials needed per dose). Mix by gently inverting infusion bag once or twice.

ContraindicationsHypersensitivity to antithymocyte globulin, rabbit proteins, or any component of the formulation; acute viral illness

Warnings/Precautions

Boxed warnings:

- Experienced physician: See "Other warnings/precautions" below.

Concerns related to adverse effects:

- Anaphylaxis: Hypersensitivity and anaphylactic reactions can occur; immediate treatment (including epinephrine 1:1000) should be available.
- Infection: Severe infections may develop following concomitant use of immunosuppressants and prolonged use or overdose of antithymocyte globulin. Appropriate antiviral, antibacterial, antiprotozoal, and/or antifungal prophylaxis is recommended.
- Malignancy: An increased incidence of lymphoma, post-transplant lymphoproliferative disease (PTLD) or other malignancies may develop following concomitant use of immunosuppressants and prolonged use or overdose of antithymocyte globulin.
- Hematologic toxicity: Reversible neutropenia and thrombocytopenia may result from the development of cross-reactive antibodies. Dose adjustment may be necessary.

Other warnings/precautions:

- Administration: Initial dose must be administered over at least 6 hours into a high flow vein; may pretreat with an antipyretic, antihistamine, and/or corticosteroid.
- Experienced physician: **[U.S. Boxed Warning]: Should only be used by physicians experienced in immunosuppressive therapy for the treatment of renal transplant patients.** Medical surveillance is required during the infusion.

Pregnancy Risk FactorC

Pregnancy ConsiderationsReproduction studies have not been conducted.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Cardiovascular: Hypertension, peripheral edema, tachycardia

Central nervous system: Chills, fever, headache, pain, malaise

Endocrine & metabolic: Hyperkalemia

Gastrointestinal: Abdominal pain, diarrhea, nausea

Genitourinary: Urinary tract infection

Hematologic: Leukopenia, thrombocytopenia

Neuromuscular & skeletal: Weakness

Respiratory: Dyspnea

Miscellaneous: Antirabbit antibody development, sepsis, systemic infection

1% to 10%:

Central nervous system: Dizziness

Gastrointestinal: Gastritis, gastrointestinal moniliasis

Miscellaneous: Herpes simplex infection, moniliasis

Postmarketing and/or case reports: Anaphylaxis, cytokine release syndrome, PTLD, neutropenia, serum sickness (delayed)

Oncology: Vesicant No

Oncology: Emetic Potential Very low (<10%)

Drug Interactions There are no known significant interactions.

Monitoring Parameters Lymphocyte profile, CBC with differential and platelet count; vital signs during administration; signs and symptoms of infection

Monitoring: Lab Tests Lymphocyte profile, CBC with differential and platelet count

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution:

Thymoglobulin®: 25 mg

Generic Available No

Mechanism of Action Polyclonal antibody which appears to cause immunosuppression by acting on T-cell surface antigens and depleting CD4 lymphocytes

Pharmacodynamics/Kinetics

Duration of action: Lymphopenia may persist ≥1 year

Half-life elimination, plasma: 2-3 days

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment Leukopenia and thrombocytopenia are common; use caution with clozapine, carbamazepine, and valproic acid

Index Terms Antithymocyte Immunoglobulin; rATG

Latrodectus mactans)'; return;">

Antivenin (*Latrodectus mactans*)

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(an tee VEN in lak tro DUK tus MAK tans)

Pharmacologic CategoryAntivenin

Use: Labeled IndicationsTreatment of patients with symptoms of black widow spider bites

Dosing: Adults

Skin test: Intradermal: 0.02 mL of a 1:10 dilution in NS (also use a control solution of NS); evaluate in 10 minutes. Positive reaction is urticarial wheal surrounded by zone of erythema.

Conjunctival test: Ophthalmic: Instill 1 drop of a 1:10 dilution into the conjunctival sac

Note: Itching of the eye and/or reddening of conjunctiva indicates a positive reaction, usually occurring within 10 minutes.

Desensitization: Note: In separate vials or syringes, prepare 1:10 and 1:100 dilutions of antivenin in NS.

SubQ: Inject 0.1, 0.2, and 0.5 mL of the 1:100 dilution at 15- to 30- minute intervals. Proceed with the next dose only if no reaction has occurred following the previous. Repeat procedure using the 1:10 dilution and then undiluted antivenin.

If a reaction occurs, apply tourniquet proximal to the injection site and administer epinephrine 1:1000. Wait at least 30 minutes, then administer another antivenin injection at the last dose which did not evoke a reaction.

If no reaction has occurred following 0.5 mL of undiluted antivenin, continue the dose at 15-minute intervals until entire dose has been administered.

Treatment of symptoms due to black widow spider bite: Administer only following the skin test or conjunctival test: I.M., I.V..: 2.5 mL

Dosing: ElderlyRefer to adult dosing.

Dosing: Pediatric

Skin test: Intradermal: Refer to adult dosing.

Conjunctival test: Ophthalmic: Instill 1 drop of a 1:100 dilution into the conjunctival sac

Note: Itching of the eye and/or reddening of conjunctiva indicates a positive reaction, usually occurring within 10 minutes.

Desensitization: Refer to adult dosing.

Treatment of symptoms due to black widow spider bite: Administer only following the skin test or conjunctival test:

Children <12 years: I.V.: 2.5 mL

Children >12 years: Refer to adult dosing.

Administration: I.M.Administer in the anterolateral thigh; apply tourniquet if systemic reaction occurs.

Administration: I.V.Administer over 15 minutes; I.V. administration is preferred in severe cases, with shock, or in children <12 years of age.

StorageStore between 2°C to 8°C (36°F to 46°F). Do not freeze.

ReconstitutionReconstitute with 2.5 mL of the provided diluent. With needle still in rubber stopper, shake well to dissolve. Excessive agitation or shaking of the reconstituted vial may cause foaming, which may lead to denaturation of the antivenin. Prior to I.V. infusion, further dilute in 10-50 mL NS.

Warnings/Precautions

Concerns related to adverse effects:

- Delayed serum sickness: Delayed serum sickness may occur 1-3 weeks from administration (especially when large doses used) even with a negative allergic history and absence of reaction to skin test.
- Horse serum hypersensitivity: Carefully review allergies and history of exposure to products containing horse serum. History of atopic sensitivity to horses may increase risk of immediate sensitivity reactions. Use with caution in patients with asthma, hay fever, or urticaria.

Dosage form specific issues:

- Thimerosal: Some products may contain thimerosal.

Other warnings/precautions:

- Desensitization: A desensitization protocol is available if sensitivity tests are mildly or questionably positive to reduce risk of immediate severe hypersensitivity reaction. Desensitization should be performed only when antivenin administration would be lifesaving. In otherwise healthy adults (16-60 years), use of antivenin may be deferred and other treatments may be considered. Epinephrine 1:1000 should be readily available.

- Skin/conjunctival test: A skin or conjunctival test should be performed prior to use in all patients. The absence of a skin hypersensitivity reaction does not exclude anaphylaxis or hypersensitivity following antivenin administration. False-negative rate for skin testing is 10% with similar agents. Conversely, hypersensitivity is not an absolute contraindication in a significantly envenomated patient.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted.
LactationExcretion in breast milk unknown/use caution
Adverse ReactionsMiscellaneous: Allergic reactions (75%), anaphylaxis, serum sickness
Drug InteractionsThere are no known significant interactions.
Monitoring ParametersSerum sickness reaction (for 8-12 days following administration); allergic reaction (for 7-14 days following administration)
Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: 6000 antivenin units [equine origin; contains thimerosal; packaged with diluent and normal horse serum for sensitivity testing]

Generic AvailableNo
Mechanism of ActionNeutralizes the venom of black widow spiders (*Latrodectus mactans*)
Pharmacotherapy PearlsEarly treatment is emphasized for prompt relief of symptoms; however, successful treatment has been seen following administration 90 hours after bite.
Dental Health: Effects on Dental TreatmentNo significant effects or complications reported
Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions
Mental Health: Effects on Mental StatusNone reported
Mental Health: Effects on Psychiatric TreatmentNone reported
Index Terms*Latrodectus mactans* Antivenin; Black Widow Spider Species Antivenin

Special Alerts

North American Coral Snake Antivenin Expiration Date Extended - November 20, 2008

Wyeth Pharmaceuticals no longer manufactures this antivenin; the last available lot (4030026) expired on October 31, 2008. There is no alternative antidote to treat coral snake envenomations. As a result, the FDA has extended the expiration on this lot until October 31, 2009. Lot 4030026 continues to be available and Wyeth will supply product to their direct customers.

Additional information available at the following FDA website: http://www.fda.gov/cber/safety/wyecor102808.htm

Pronunciation(an tee VEN in mye KRU rus FUL vee us)
Pharmacologic CategoryAntivenin
Use: Labeled IndicationsNeutralization of venoms of Eastern coral snake and Texas coral snake
Dosing: AdultsNeutralize Eastern and Texas coral snake venom (does not neutralize venom of Arizona or Sonoran coral snake): I.V.: 3-5 vials by slow injection (dependent on severity of signs/symptoms; some patients may need more than 10 vials)

Note: Each vial of antivenom neutralizes ~2 mg of venom.

Dosing: ElderlyRefer to adult dosing.
Dosing: PediatricRefer to adult dosing.
Administration: I.V.Have ready access to drugs and equipment for resuscitation. Perform skin test prior to administration. An intravenous infusion of NS 250-500 mL should be started, and doses of antivenin delivered by slow injection or via reservoir bottle. Inject the first 1-2 mL of antivenin over 3-5 minutes. Rate of infusion will be regulated by tolerance of antivenin and severity of envenomation.
StoragePrior to reconstitution, store at 2°C to 8°C (36°F to 46°F). Do not freeze.
ReconstitutionDilute each vial with SWFI 10 mL. Vial contains a vacuum which will pull the diluent in; point diluent stream at the center of the lyophilized pellet. If diluent runs down side of vial, the pellet will float and adhere to vial stopper. Swirl gently for 1 minute; do not shake. Repeat every 5 minutes. Reconstitution takes ~30 minutes/vial. Color of final solution may vary from clear to slight yellow or green.
ContraindicationsConcomitant use with opioid analgesics or other respiratory depressants; history of anaphylaxis to equine-derived serum is a relative contraindication
Warnings/Precautions

Concerns related to adverse effects:

- Delayed serum sickness: Delayed serum sickness may occur 1-3 weeks from administration (especially when large doses used) even with a negative allergic history and absence of reaction to skin test.
- Horse serum hypersensitivity: Carefully review allergies and history of exposure to products containing horse serum. History of atopic sensitivity to horses may increase risk of immediate sensitivity reactions. Use with caution in patients with asthma, hay fever, or urticaria.

Other warnings/precautions:

- Resuscitation precautions: When administering this agent, have ready access to drugs and equipment for resuscitation.
- Skin test: Perform skin test prior to administration. The absence of a skin hypersensitivity reaction does not exclude anaphylaxis or hypersensitivity following antivenin administration. False-negative rate for skin testing is 10% with similar agents. Conversely, hypersensitivity is not an absolute contraindication in a significantly envenomated patient.
- Does not neutralize venom of Arizona or Sonoran coral snake

Pregnancy Risk FactorC
Adverse ReactionsFrequency not defined.

Central nervous system: Meningismus, pain

Neuromuscular & skeletal: Muscle weakness, peripheral neuritis

Miscellaneous:

Immediate systemic reactions (allergic, anaphylaxis, shock): May occur within 30 minutes and may start before needle is withdrawn; symptoms include apprehension, cough, collapse, cyanosis, dyspnea, edema (face, throat, tongue), flushing, itching, urticaria, vomiting

Delayed systemic reactions (serum sickness): Usually occur 5-24 days following administration; symptoms include arthralgia, edema, fever, lymphadenopathy, malaise, urticaria, nausea, vomiting

Drug Interactions There are no known significant interactions.

Dosage Forms Excipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, powder for reconstitution: Derived from *Micrurus fulvius* venom [equine origin; contains phenol and thimerosal; packaged with diluent] [DSC]

Generic Available No

Mechanism of Action Neutralizes the venom of the Eastern coral snake and Texas coral snake with specific antibodies.

Pharmacotherapy Pearls Refer to manufacturer's labeling for skin test instructions and desensitization protocol.

Dental Health: Effects on Dental Treatment No significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic Precautions No information available to require special precautions

Mental Health: Effects on Mental Status None reported

Mental Health: Effects on Psychiatric Treatment Combined use with a beta-blocker may increase the severity of anaphylaxis. Contraindicated with opioids. Use caution with psychotropic agents; may produce additive respiratory-depressant effects.

Apomorphine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Pronunciation(a poe MOR feen)

U.S. Brand NamesApokyn®

Pharmacologic CategoryAnti-Parkinson's Agent, Dopamine Agonist

Use: Labeled IndicationsTreatment of hypomobility, “off” episodes with Parkinson's disease

Use: Unlabeled/InvestigationalTreatment of erectile dysfunction

Dosing: AdultsBegin antiemetic therapy 3 days prior to initiation and continue for 2 months before reassessing need.

Parkinson's disease, “off” episode: SubQ: Initial test dose 2 mg, **medical supervision required; see “Note”**. Subsequent dosing is based on both tolerance and response to initial test dose.

If patient tolerates test dose and responds: Starting dose: 2 mg as needed; may increase dose in 1 mg increments every few days; maximum dose: 6 mg

If patient tolerates but does not respond to 2 mg test dose: Second test dose: 4 mg

If patient tolerates and responds to 4 mg test dose: Starting dose: 3 mg, as needed for “off” episodes; may increase dose in 1 mg increments every few days; maximum dose 6 mg

If patient does not tolerate 4 mg test dose: Third test dose: 3 mg

If patient tolerates 3 mg test dose: Starting dose: 2 mg as needed for “off” episodes; may increase dose in 1 mg increments to a maximum of 3 mg

If therapy is interrupted for >1 week, restart at 2 mg and gradually titrate dose.

Note: Medical supervision is required for all test doses with standing and supine blood pressure monitoring predose and 20-, 40-, and 60 minutes postdose. If subsequent test doses are required, wait >2 hours before another test dose is given; next test dose should be timed with another “off” episode. If a single dose is ineffective for a particular “off” episode, then a second dose should not be given. The average dosing frequency was 3 times/day in the development program with limited experience in dosing >5 times/day and with total daily doses >20 mg. Apomorphine is intended to treat the “off” episodes associated with levodopa therapy of Parkinson's disease and has not been studied in levodopa-naive Parkinson's patients.

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal Impairment

Mild-to-moderate impairment: Reduce test dose and starting dose: 1 mg

Severe impairment: Has not been studied

Dosing: Hepatic Impairment

Mild-to-moderate impairment: Use caution

Severe impairment: Has not been studied

Administration: I.V.Not for I.V. administration.

Administration: OtherSubQ: Initiate antiemetic 3 days before test dose of apomorphine and continue for 2 months (if patient to be treated) before reassessment. Administer in abdomen, upper arm, or upper leg; change site with each injection. 3 mL cartridges are used with a manual, reusable, multidose injector pen. Injector pen can deliver doses up to 1 mL in 0.02 mL increments. Do not give intravenously; thrombus formation or pulmonary embolism may occur.

Dietary ConsiderationsAvoid ethanol consumption.

StorageStore at 15°C to 30°C (59°F to 86°F).

ContraindicationsHypersensitivity to apomorphine or any component of the formulation; **concomitant use with $5HT_3$antagonists**; intravenous administration

Warnings/Precautions

Concerns related to adverse effects:

- Hallucinations: May cause hallucinations.
- Impulsive control disorders: Dopamine agonists used for Parkinson’s disease or restless legs syndrome have been associated with compulsive behaviors and/or loss of impulse control, which has manifested as pathological gambling, libido increases (hypersexuality), and/or binge eating. Causality has not been established, and controversy exists as to whether this phenomenon is related to the underlying disease, prior behaviors/addictions and/or drug therapy. Dose reduction or discontinuation of therapy has been reported to reverse these behaviors in some, but not all cases.
- Orthostatic hypotension: May cause orthostatic hypotension; Parkinson's disease patients appear to have an impaired capacity to

respond to a postural challenge. Use with caution in patients at risk of hypotension (such as those receiving antihypertensive drugs) or where transient hypotensive episodes would be poorly tolerated (cardiovascular disease or cerebrovascular disease). Parkinson's patients being treated with dopaminergic agonists ordinarily require careful monitoring for signs and symptoms of postural hypotension, especially during dose escalation, and should be informed of this risk. Orthostasis peaks 20 minutes after dosing and lasts at least 90 minutes. If patient develops clinically-significant orthostatic hypotension with test dose, then apomorphine should not be used.

- Pleural/retroperitoneal fibrosis: Ergot-derived dopamine agonists have also been associated with fibrotic complications (eg, retroperitoneal fibrosis, pleural thickening, and pulmonary infiltrates); monitor closely for signs and symptoms of fibrosis.
- Retinal changes: Pathologic degenerative changes were observed in the retinas of albino rats during studies with this agent, but were not observed in the retinas of albino mice or in other species. The significance of these data for humans remains uncertain.
- Somnolence: Patients have reported falling asleep while engaging in activities of daily living; this has been reported to occur without significant warning signs. Monitor for daytime somnolence or pre-existing sleep disorder; caution with concomitant sedating medication; discontinue if significant daytime sleepiness or episodes of falling asleep occur. Patients must be cautioned about performing tasks which require mental alertness (eg, operating machinery or driving). Use with caution in patients receiving other CNS depressants or psychoactive agents. Effects with other sedative drugs or ethanol may be potentiated.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease; hypotension may cause coronary ischemia.
- Cerebrovascular disease: Use with caution in patients with cerebrovascular disease; hypotension may cause cerebral ischemia.
- Dyskinesias: Use with caution in patients with pre-existing dyskinesias; may be exacerbated.
- Hepatic impairment: Use with caution in patients with hepatic impairment.
- Patients at risk for torsade de pointes: Use with caution in patients with risk factors for torsade de pointes (hypokalemia, hypomagnesemia, bradycardia, concurrent use of drugs that prolong QT_c, or genetic predisposition).
- Renal impairment: Use with caution in patients with renal impairment.

Concurrent drug therapy issues:

- Antiemetic pretreatment: **Pretreatment with antiemetic is necessary;** avoid pretreatment with antidopaminergic and antiserotonin antiemetic agents (antiemetic experience is greatest with trimethobenzamide).

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Dosage form specific issues:

- Metabisulfite: Contains metabisulfite which may cause allergic reactions in some individuals.

Other warnings/precautions:

- Abuse: Rare cases of abuse have been reported.
- Discontinuation of therapy: Dopaminergic agents have been associated with a syndrome resembling neuroleptic malignant syndrome on abrupt withdrawal or significant dosage reduction after long-term use.

Pregnancy Risk FactorC
Pregnancy ConsiderationsReproduction studies have not been conducted; use only if clearly needed.
LactationExcretion in breast milk unknown/contraindicated
Adverse Reactions

>10%:

Cardiovascular: Chest pain/pressure or angina (15%)

Central nervous system: Drowsiness or somnolence (35%), dizziness or orthostatic hypotension (20%)

Gastrointestinal: Nausea and/or vomiting (30%)

Neuromuscular & skeletal: Falls (30%), dyskinesias (24% to 35%)

Respiratory: Yawning (40%), rhinorrhea (20%)

1% to 10%:

Cardiovascular: Edema (10%), vasodilation (3%), hypotension (2%), syncope (2%), CHF

Central nervous system: Hallucinations or confusion (10%), anxiety, depression, fatigue, headache, insomnia, pain

Dermatologic: Bruising

Endocrine & metabolic: Dehydration

Gastrointestinal: Constipation, diarrhea

Local: Injection site reactions

Neuromuscular & skeletal: Arthralgias, weakness

Miscellaneous: Diaphoresis increased

<1%: Angina, cardiac arrest, focal panniculitis, libido increased, MI, priapism, psychosexual stimulation, skin nodules, sudden death

Postmarketing and/or case reports: Reported with dopamine agonists: Impulsive/compulsive behaviors (eg, pathological gambling, hypersexuality, binge eating)

Metabolism/Transport Effects**Substrate** (minor) of CYP1A2, 3A4, 2C19; **Inhibits** CYP1A2 (weak), 3A (weak), 2C19 (weak)

Drug Interactions

Alfuzosin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

Antiemetics (5HT3 Antagonists): May enhance the hypotensive effect of Apomorphine. *Risk X: Avoid combination*

Antipsychotics (Atypical): May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Antipsychotics (Typical): May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk D: Consider therapy modification*

Ciprofloxacin: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk C: Monitor therapy*

COMT Inhibitors: May decrease the metabolism of COMT Substrates. *Risk C: Monitor therapy*

Gadobutrol: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk D: Consider therapy modification*

Metoclopramide: May diminish the therapeutic effect of Anti-Parkinson's Agents (Dopamine Agonist). *Risk C: Monitor therapy*

Nilotinib: May enhance the QTc-prolonging effect of QTc-Prolonging Agents. *Risk X: Avoid combination*

QTc-Prolonging Agents: May enhance the adverse/toxic effect of other QTc-Prolonging Agents. Their effects can be additive, causing life-threatening ventricular arrhythmias. *Risk D: Consider therapy modification*

Tetrabenazine: QTc-Prolonging Agents may enhance the QTc-prolonging effect of Tetrabenazine. *Risk X: Avoid combination*

Ethanol/Nutrition/Herb Interactions

Ethanol: Caution with ethanol consumption; may increase risk of hypotension.

Monitoring ParametersEach test dose: Supine and standing blood pressure predose and 20, 40, and 60 minutes postdose; drowsiness

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other prescriptions, OTC medications, or herbal products patient may be taking. See Dosing and Administration for specifics about "test" doses and necessity of premedication with antiemetic prior to each dose. Patient must be monitored closely for minimum of 90 minutes following each test dose (eg, orthostatic hypotension). Assess therapeutic effectiveness and adverse response (eg, orthostatic hypotension, nausea, vomiting, dyskinesias, excessive sedation or somnolence) at beginning of therapy, with each change in dose, and at regular intervals during therapy. Teach patient (or caregiver) proper use (injection pen or syringe, needle disposal), possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationDo not take any new medications during therapy without consulting prescriber. Follow specific directions for administration with injection pen or syringe and needle disposal. Avoid alcohol while taking Apokyn™. An antiemetic may be prescribed to reduce nausea or vomiting; take as directed. May cause headache, drowsiness, or dizziness (use caution when climbing stairs, driving, or engaged in potentially hazardous tasks until response to drug is known); loss of impulse control (possibly manifested as pathological gambling, libido increases, and/or binge eating); postural hypotension (use caution climbing stairs or when changing position from lying or sitting to standing); or nausea or vomiting (if antiemetic medication does not relieve this, contact prescriber). Report immediately any irregular or rapid heartbeat, chest pain, palpitations, difficulty breathing, shortness of breath; unusual or sudden sleepiness; unusual muscle or skeletal movements or weakness, tremors, or altered gait; CNS changes (hallucinations, confusion, insomnia, anxiety, or depression); suicide ideation; redness, swelling, or irritation at injection site; or other persistent side effects. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Breast-feeding is contraindicated.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution, as hydrochloride:

Apokyn®: 10 mg/mL (2 mL) [ampul; contains sodium metabisulfite]; (3 mL) [multidose cartridge; contains sodium metabisulfite and benzyl alcohol]

Generic AvailableNo

ManufacturerMylan Bertek Pharmaceuticals

Mechanism of ActionStimulates postsynaptic D2-type receptors within the caudate putamen in the brain.

Pharmacodynamics/Kinetics

Onset: SubQ: Rapid

Distribution: V_d: Mean: 218 L

Metabolism: Not established; potential routes of metabolism include sulfation, N-demethylation, glucuronidation, and oxidation; catechol-O methyltransferase and nonenzymatic oxidation. CYP isoenzymes do not appear to play a significant role.

Half-life elimination: Terminal: 40 minutes

Time to peak, plasma: Improved motor scores: 20 minutes

Excretion: Urine 93% (as metabolites); feces 16%

Related Information

- Antiparkinsonian Agents

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Orthostatic hypotension has been reported in significant numbers of patients.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsApomorphine is one of the drugs confirmed to prolong the QT interval and is accepted as having a risk of causing torsade de pointes. The risk of drug-induced torsade de pointes is extremely low when a single QT interval prolonging drug is prescribed. In terms of epinephrine, it is not known what effect vasoconstrictors in the local anesthetic regimen will have in patients with a known history of congenital prolonged QT interval or in patients taking any medication that prolongs the QT interval. Until more information is obtained, it is suggested that the clinician consult with the physician prior to the use of a vasoconstrictor in suspected patients, and that the vasoconstrictor (epinephrine, levonordefrin [Neo-Cobefrin®]) be used with caution.

Index TermsApomorphine Hydrochloride; Apomorphine Hydrochloride Hemihydrate

Apraclonidine

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Iopidine® may be confused with indapamide, iodine, Lodine®

Pronunciation(a pra KLOE ni deen)

U.S. Brand NamesIopidine®

Canadian Brand NamesIopidine®

Pharmacologic CategoryAlpha$_2$ Agonist, Ophthalmic

Use: Labeled IndicationsPrevention and treatment of postsurgical intraocular pressure (IOP) elevation; short-term, adjunctive therapy in patients who require additional reduction of IOP

Dosing: AdultsPostsurgical intraocular pressure elevation (prevention/treatment): Ophthalmic:

0.5%: Instill 1-2 drops in the affected eye(s) 3 times/day

1%: Instill 1 drop in operative eye 1 hour prior to anterior segment laser surgery, second drop in eye immediately upon completion of procedure

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentAlthough the topical use of apraclonidine has not been studied in renal failure patients, structurally-related clonidine undergoes a significant increase in half-life in patients with severe renal impairment. Close monitoring of cardiovascular parameters in patients with impaired renal function is advised.

Dosing: Hepatic ImpairmentClose monitoring of cardiovascular parameters in patients with impaired liver function is advised because the systemic dosage form of clonidine is partially metabolized in the liver.

Administration: OtherWait 5 minutes between instillation of other ophthalmic agents to avoid washout of previous dose. After topical instillation, finger pressure should be applied to lacrimal sac to decrease drainage into the nose and throat and minimize possible systemic absorption.

StorageStore between 2°C to 27°C (36°F to 80°F). Protect from freezing and light.

ContraindicationsHypersensitivity to apraclonidine, clonidine, or any component of the formulation; use with or within 14 days of MAO inhibitors

Allergy Considerations

- Apraclonidine Allergy

Warnings/Precautions

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease, coronary insufficiency, or recent myocardial infarction.
- Vasovagal reactions: Use with caution in patients with history of vasovagal reactions.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Monitoring efficacy: The IOP-lowering efficacy observed during the first month of therapy may not always reflect the long-term level of IOP reduction; routinely monitor IOP.

Geriatric ConsiderationsDetermine that the patient or caregiver can adequately administer ophthalmic medication dosage form.

Pregnancy Risk FactorC

Pregnancy ConsiderationsEmbryocidal effects were observed in some animal studies. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

Ocular:

5% to 15%: Discomfort, hyperemia, pruritus

1% to 5%: Blanching, blurred vision, conjunctivitis, discharge, dry eye, foreign body sensation, lid edema, tearing

<1%: Abnormal vision, blepharitis, blepharoconjunctivitis, conjunctival edema, conjunctival follicles, corneal erosion, corneal infiltrate,

corneal staining, edema, irritation, keratitis, keratopathy, lid disorder, lid erythema, lid margin crusting, lid retraction, lid scales, pain, photophobia

Other body systems:

1% to 10%: Gastrointestinal: Dry mouth (10%)

<3%:

Cardiovascular: Arrhythmia, chest pain, facial edema, peripheral edema

Central nervous system: Depression, dizziness, headache, insomnia, malaise, nervousness, somnolence

Dermatologic: Contact dermatitis, dermatitis

Gastrointestinal: Constipation, nausea, taste perversion

Neuromuscular & skeletal: Abnormal coordination, myalgia, paresthesia, weakness

Respiratory: Asthma, dry nose, dyspnea, parosmia, pharyngitis, rhinitis

Postmarketing and/or case reports: Allergic reactions, bradycardia

Drug Interactions

Amifostine: Antihypertensives may enhance the hypotensive effect of Amifostine. Management: When amifostine is used at chemotherapy doses, antihypertensive medications should be withheld for 24 hours prior to amifostine administration. If antihypertensive therapy can not be withheld, amifostine should not be administered. *Risk D: Consider therapy modification*

Diazoxide: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypertensive Properties): May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Herbs (Hypotensive Properties): May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

MAO Inhibitors: May enhance the hypertensive effect of Alpha2-Agonists (Ophthalmic). *Risk X: Avoid combination*

Methylphenidate: May diminish the antihypertensive effect of Antihypertensives. *Risk C: Monitor therapy*

Prostacyclin Analogues: May enhance the hypotensive effect of Antihypertensives. *Risk C: Monitor therapy*

RiTUXimab: Antihypertensives may enhance the hypotensive effect of RiTUXimab. *Risk D: Consider therapy modification*

Monitoring ParametersClosely monitor patients who develop exaggerated reductions in intraocular pressure

Nursing: Physical Assessment/MonitoringAssess potential for interactions with other pharmacological agents patient may be taking. Monitor therapeutic response (intraocular pressure) and adverse effects (ocular and other systems). Teach patient proper use, side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationFor use in eyes only. May sting on instillation, do not touch dropper to eye. Visual acuity may be decreased after administration. Night vision may be decreased. Distance vision may be altered. Read package instructions for insertion. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnancy. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution, ophthalmic:

Iopidine®: 0.5% (5 mL, 10 mL); 1% (0.1 mL) [contains benzalkonium chloride]

Generic AvailableNo

Pricing: U.S. (www.drugstore.com)

Solution (Iopidine)

0.5% (5): $85.99

0.5% (10): $160.52

1% (24): $299.97

Mechanism of ActionApraclonidine is a potent alpha-adrenergic agent similar to clonidine; relatively selective for alpha$_2$-receptors but does retain some binding to alpha$_1$-receptors; appears to result in reduction of aqueous humor formation; its penetration through the blood-brain barrier is more polar than clonidine which reduces its penetration through the blood-brain barrier and suggests that its pharmacological profile is characterized by peripheral rather than central effects.

Pharmacodynamics/Kinetics

Onset of action: 1 hour

Peak effect: Decreased intraocular pressure: 3-5 hours

Absorption: Ocular: Systemically absorbed

Half-life elimination, systemic: 8 hours

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Xerostomia (normal salivary flow resumes

upon discontinuation)

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause drowsiness

Mental Health: Effects on Psychiatric TreatmentDry mouth may be exacerbated by concurrent use of psychotropics

Index TermsAplonidine; Apraclonidine Hydrochloride; p-Aminoclonidine

Aprepitant

Lexi-Drugs Online

English

Jump To Field (Select Field Name)

Medication Safety Issues

Sound-alike/look-alike issues:

Aprepitant may be confused with fosaprepitant

Emend® (aprepitant) oral capsule formulation may be confused with Emend® for injection (fosaprepitant).

Pronunciation(ap RE pi tant)
U.S. Brand NamesEmend®
Canadian Brand NamesEmend®
Pharmacologic CategoryAntiemetic; Substance P/Neurokinin 1 Receptor antagonist
Use: Labeled IndicationsPrevention of acute and delayed nausea and vomiting associated with moderately- and highly-emetogenic chemotherapy (in combination with other antiemetics); prevention of postoperative nausea and vomiting (PONV)
Dosing: Adults

Prevention of chemotherapy induced nausea/vomiting: Oral: 125 mg on day 1, followed by 80 mg on days 2 and 3 in combination with other antiemetics

Prevention of PONV: Oral: 40 mg within 3 hours prior to induction

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentNo dose adjustment necessary in patients with renal disease or end-stage renal disease maintained on hemodialysis.
Dosing: Hepatic Impairment

Mild-to-moderate impairment (Child-Pugh Class A and B): No adjustment necessary.

Severe impairment (Child-Pugh Class C): No data available.

Administration: OralAdminister with or without food.

Chemotherapy induced nausea/vomiting: First dose should be given 1 hour prior to antineoplastic therapy; subsequent doses should be given in the morning.

PONV: Administer within 3 hours of induction

Dietary ConsiderationsMay be taken with or without food.
StorageStore at controlled room temperature of 20°C to 25°C (68°F to 77°F).
ContraindicationsHypersensitivity to aprepitant or any component of the formulation; use with cisapride or pimozide
Warnings/Precautions

Disease-related concerns:

- Hepatic impairment: Use with caution in patients with hepatic impairment; has not been studied in patients with severe hepatic impairment (Child-Pugh Class C).

- Nausea/vomiting: Appropriate use: Not intended for treatment of existing nausea and vomiting or for chronic continuous therapy.

Concurrent drug therapy issues:

- High potential for interactions: Use with caution in patients taking strong CYP3A4 inhibitors, moderate or strong CYP3A4 inducers and major CYP3A4 substrates (see Drug Interactions); consider alternative agents that avoid or lessen the potential for CYP-mediated interactions. The effect on orally administered CYP3A4 substrates is greater than those administered intravenously.

Geriatric ConsiderationsIn two studies by the manufacturer, with a total of 544 patients, 31% were >65 years of age, while 5% were >75 years. No differences in safety and efficacy were noted between elderly subjects and younger adults. No dosing adjustment is necessary.
Pregnancy Risk FactorB
Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women; use only if clearly needed.
LactationExcretion in breast milk unknown/not recommended
Adverse Reactions**Note:** Adverse reactions reported as part of a combination chemotherapy regimen or with general anesthesia.

>10%:

Central nervous system: Fatigue (18% to 22%)

Gastrointestinal: Nausea (7% to 13%), constipation (9% to 12%)

Neuromuscular & skeletal: Weakness (3% to 18%)

Miscellaneous: Hiccups (11%)

1% to 10%:

Cardiovascular: Hypotension (≤6%), bradycardia (4%)

Central nervous system: Dizziness (≤7%)

Endocrine & metabolic: Dehydration (6%), hot flushing (3%)

Gastrointestinal: Diarrhea (6% to 10%), dyspepsia (8%), abdominal pain (5%), stomatitis (5%), epigastric discomfort (4%), gastritis (4%), throat pain (3%), vomiting (3%)

Hematologic: Neutropenia (3% to 9%), leukopenia (9%), hemoglobin decreased (2% to 5%)

Hepatic: ALT increased (1% to 6%), AST increased (3%)

Renal: BUN increased (5%), proteinuria (7%), serum creatinine increased (4%)

>0.5%: Acid reflux, acne, albumin decreased, alkaline phosphatase increased, anemia, anxiety, appetite decreased, arthralgia, back pain, bilirubin increased, candidiasis, confusion, conjunctivitis, cough, deglutition disorder, depression, diabetes mellitus, diaphoresis, dry mouth, DVT, dysgeusia, dysphagia, dyspnea, dysuria, edema, eructation, erythrocyturia, febrile neutropenia, flatulence, flushing, herpes simplex, hyperglycemia, hypertension, hypokalemia, hyponatremia, hypovolemia, hypoxia, glucosuria, leukocytes increased, leukocyturia, malaise, MI, muscular weakness, musculoskeletal pain, myalgia, nasal secretion, obstipation, palpitation, pelvic pain, peripheral neuropathy, pharyngitis, pneumonitis, pulmonary embolism, rash, renal insufficiency, respiratory infection, respiratory insufficiency, rigors, salivation increased, sensory neuropathy, septic shock, syncope, tachycardia, taste disturbance, thrombocytopenia, tremor, urinary tract infection, vocal disturbance, weight loss

Postmarketing and/or case reports: Angioedema, disorientation, duodenal ulcer (perforating), dysarthria, enterocolitis, hypoesthesia, neutropenic sepsis, pneumonia, sensory disturbance, sinus tachycardia, Stevens-Johnson syndrome, urticaria, visual acuity decreased, wheezing

Metabolism/Transport Effects **Substrate** of CYP1A2 (minor), 2C19 (minor), 3A4 (major); **Inhibits** CYP2C9 (weak), 2C19 (weak), 3A4 (moderate); **Induces** CYP2C9 (weak), 3A4 (weak)

Drug Interactions

Antifungal Agents (Azole Derivatives, Systemic): May decrease the metabolism of Aprepitant. *Risk C: Monitor therapy*

Benzodiazepines (metabolized by oxidation): Aprepitant may increase the serum concentration of Benzodiazepines (metabolized by oxidation). *Risk C: Monitor therapy*

Cisapride: Aprepitant may increase the serum concentration of Cisapride. *Risk X: Avoid combination*

Contraceptive (Progestins): Aprepitant may decrease the serum concentration of Contraceptive (Progestins). *Risk D: Consider therapy modification*

Corticosteroids (Systemic): Aprepitant may increase the serum concentration of Corticosteroids (Systemic). *Risk D: Consider therapy modification*

CYP3A4 Inducers (Strong): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Moderate): May decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

CYP3A4 Inhibitors (Strong): May decrease the metabolism of CYP3A4 Substrates. *Risk D: Consider therapy modification*

CYP3A4 Substrates: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Dasatinib: May increase the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Deferasirox: May decrease the serum concentration of CYP3A4 Substrates. *Risk C: Monitor therapy*

Diltiazem: Aprepitant may increase the serum concentration of Diltiazem. Diltiazem may increase the serum concentration of Aprepitant. *Risk C: Monitor therapy*

Eplerenone: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Eplerenone. Management: A lower starting dose of eplerenone (25 mg once daily) is recommended in patients with hypertension who are also taking drugs that are moderate inhibitors of CYP3A4. *Risk D: Consider therapy modification*

FentaNYL: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of FentaNYL. *Risk D: Consider therapy modification*

Herbs (CYP3A4 Inducers): May increase the metabolism of CYP3A4 Substrates. *Risk C: Monitor therapy*

Maraviroc: CYP3A4 Inhibitors may increase the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Maraviroc: CYP3A4 Inducers may decrease the serum concentration of Maraviroc. *Risk D: Consider therapy modification*

Oral Contraceptive (Estrogens): Aprepitant may decrease the serum concentration of Oral Contraceptive (Estrogens). *Risk D: Consider therapy modification*

Pimecrolimus: CYP3A4 Inhibitors (Moderate) may decrease the metabolism of Pimecrolimus. *Risk C: Monitor therapy*

Pimozide: Aprepitant may increase the serum concentration of Pimozide. *Risk X: Avoid combination*

Ranolazine: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Ranolazine. Management: Limit the ranolazine dose to a maximum of 500mg twice daily in patients concurrently receiving moderate CYP3A4 inhibitors (e.g., diltiazem, verapamil, erythromycin, etc.). *Risk D: Consider therapy modification*

Rifamycin Derivatives: May increase the metabolism of Aprepitant. *Risk C: Monitor therapy*

Salmeterol: CYP3A4 Inhibitors (Moderate) may increase the serum concentration of Salmeterol. *Risk C: Monitor therapy*

Warfarin: Aprepitant may decrease the serum concentration of Warfarin. *Risk C: Monitor therapy*

Ethanol/Nutrition/Herb Interactions

Food: Aprepitant serum concentration may be increased when taken with grapefruit juice; avoid concurrent use.

Herb/Nutraceutical: Avoid St John's wort (may decrease aprepitant levels).

Nursing: Physical Assessment/MonitoringShould be used in combination with other medications (corticosteroid and 5-HT$_3$ receptor antagonist). Assess potential for interactions with other pharmacological agents and herbal products patient may be taking. Assess for therapeutic effectiveness (decreased nausea/vomiting) and adverse reactions (fatigue, weakness, gastrointestinal disturbance, dehydration). Teach patient proper use, possible side effects/appropriate interventions, and adverse symptoms to report.

Patient EducationThis medication may be prescribed in combination with other medications; follow directions and timing exactly. May take with or without food depending on reason for use; avoid grapefruit juice and St John's wort while taking this medication. Report unusual fatigue, weakness, dizziness, disorientation, abdominal discomfort, chest pain, respiratory distress, or other persistent side effects to prescriber. **Breast-feeding precautions:** Breast-feeding is not recommended.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Capsule:

Emend®: 40 mg, 80 mg, 125 mg

Combination package [each package contains]:

Emend®:

Capsule: 80 mg (2s)

Capsule: 125 mg (1s)

Generic AvailableNo

ManufacturerMerck and Co, Inc

Pricing: U.S. (www.drugstore.com)

Capsules (Emend)

40 mg (1): $52.99

40 mg (5): $239.99

80 mg (2): $190.99

80 mg (5): $499.95

80 mg (6): $579.97

125 mg (6): $819.99

Misc (Emend Tri-fold)

80 & 125 mg (3): $322.30

Mechanism of ActionPrevents acute and delayed vomiting by inhibiting the substance P/neurokinin 1 (NK$_1$) receptor; augments the antiemetic activity of the 5-HT$_3$ receptor antagonist and corticosteroid activity and inhibits both acute and delayed phases of chemotherapy-induced emesis.

Pharmacodynamics/Kinetics

Distribution: V$_d$: ~70 L; crosses the blood brain barrier

Protein binding: >95%

Metabolism: Extensively hepatic via CYP3A4 (major); CYP1A2 and CYP2C19 (minor); forms 7 metabolites (weakly active)

Bioavailability: 60% to 65%

Half-life elimination: Terminal: ~9-13 hours

Time to peak, plasma: ~3-4 hours

Pharmacotherapy Pearls**Oncology Comment:** Aprepitant is recommended in the American Society of Clinical Oncology (ASCO) oncology antiemetic guidelines for use in combination with a serotonin receptor antagonist and dexamethasone for chemotherapy with high emetic risk and for chemotherapy regimens of moderate emetic risk which contain an anthracycline and cyclophosphamide (Kris, 2006). The National Comprehensive Cancer Network (NCCN) Clinical Practice Guidelines in Oncology for Antiemesis recommend the same use of aprepitant as is in the ASCO recommendation. The NCCN guidelines however, also suggest that aprepitant may be used for select moderately emetogenic regimens (carboplatin, cisplatin, doxorubicin, epirubicin, ifosfamide, irinotecan, and methotrexate).

Dental Health: Effects on Dental TreatmentKey adverse event(s) related to dental treatment: Hiccups, stomatitis, and mucous membrane disorder.

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusFatigue and weakness are common; may cause dizziness

Mental Health: Effects on Psychiatric TreatmentContraindicated with pimozide. Nausea is common; may be additive when used with SSRIs; monitor. Nefazodone may inhibit aprepitant's metabolism, while carbamazepine may increase its metabolism. Plasma levels of alprazolam, midazolam, and triazolam may be increased when combined with aprepitant. Plasma levels of paroxetine may be decreased with combined use; monitor.

Index TermsL 754030; MK 869

Aprotinin (Trasylol®) Removed From U.S. Market - May 2008

Following publication of the "Blood Conservation Using Antifibrinolytics: A Randomized Trial in a Cardiac Surgery Population (BART)" study in the May 14, 2008 issue of *The New England Journal of Medicine*, Bayer Pharmaceuticals Inc has notified the U.S. Food and Drug Administration (FDA) of their intent to remove all remaining supplies of aprotinin from U.S. hospital pharmacies and warehouses. The BART study revealed that although aprotinin was associated with a reduction in massive postoperative bleeding, aprotinin was associated with a higher rate of mortality from any cause.

Access to aprotinin is now limited to investigational use only. A specific treatment protocol outlines use in patients who are at increased risk of blood loss and transfusions during coronary artery bypass graft surgery with no acceptable therapeutic alternative. Healthcare providers using aprotinin for this situation must also ensure that the benefits outweigh the risks for their patient.

Further information can be found at the following website: http://www.fda.gov/bbs/topics/NEWS/2008/NEW01834.html

Pronunciation(a proe TYE nin)
U.S. Brand NamesTrasylol®
Canadian Brand NamesTrasylol®
Pharmacologic CategoryBlood Product Derivative; Hemostatic Agent
Use: Labeled IndicationsPrevention of perioperative blood loss in patients who are at increased risk for blood loss and blood transfusions in association with cardiopulmonary bypass in coronary artery bypass graft surgery
Dosing: AdultsTest dose: **All** patients should receive a 1 mL (1.4 mg) I.V. test dose at least 10 minutes prior to the loading dose to assess the potential for allergic reactions.

Notes:

The loading dose should be given after induction of anesthesia but prior to sternotomy. In patients with previous exposure to aprotinin, administer loading dose just prior to cannulation. A constant infusion is continued until surgery is complete.

To avoid physical incompatibility with heparin when adding to pump-prime solution, each agent should be added during recirculation to assure adequate dilution.

Regimen A (standard dose):

2 million KIU (280 mg; 200 mL) loading dose I.V. over 20-30 minutes

2 million KIU (280 mg; 200 mL) into pump prime volume

500,000 KIU/hour (70 mg/hour; 50 mL/hour) I.V. during operation

Regimen B (low dose):

1 million KIU (140 mg; 100 mL) loading dose I.V. over 20-30 minutes

1 million KIU (140 mg; 100 mL) into pump prime volume

250,000 KIU/hour (35 mg/hour; 25 mL/hour) I.V. during operation

Dosing: ElderlyRefer to adult dosing.
Dosing: Renal ImpairmentNo adjustment required, but increased risk of worsening renal dysfunction with use; monitor closely
Dosing: Hepatic ImpairmentNo information available.
Administration: I.V.Administer through a central line. Infuse loading dose over 20-30 minutes, then continuous infusion at 50 mL/hour (regimen A) or 25 mL/hour (regimen B). Rapid infusion (<20 minutes) can cause transient blood pressure decrease; to avoid incompatibility with heparin, add while recirculating the prime fluid of the cardiac bypass circuit.
Administration: I.V. DetailDo not infuse any other drug through the same line.

pH: 4.5-6.5

StorageStore at 2°C to 25°C (36°F to 77°F). Protect from freezing.
Compatibility**Incompatible** with corticosteroids, heparin, tetracyclines, amino acid solutions, and fat emulsion.
RestrictionsAvailable in U.S. under an investigational new drug (IND) process. The program will provide aprotinin for the treatment of adult

patients undergoing coronary artery bypass graft (CABG) surgery requiring cardiopulmonary bypass (CPB) who are at increased risk of bleeding and transfusion during CABG surgery with no acceptable therapeutic alternative. Healthcare providers using aprotinin for this situation must also ensure that the benefits outweigh the risks for their patient. U.S. healthcare providers with patients who may qualify can access information and forms for enrollment at http://www.trasylol.com/main.htm or contact Bayer Medical Communications at (888) 842-2937.

ContraindicationsHypersensitivity to aprotinin or any component of the formulation; known or suspected exposure (including through fibrin sealant products that contain aprotinin) within the past 12 months

Warnings/Precautions

Boxed warnings:

- Anaphylaxis/hypersensitivity reactions: See “Concerns related to adverse effects” below.

Concerns related to adverse effects:

- Anaphylaxis/hypersensitivity reactions: **[U.S. Boxed Warning]: Anaphylactic reactions are possible.** Hypersensitivity reactions are more common with repeated use; the risk of fatal reactions appears to be greater upon re-exposure within 12 months of previous use. Patients with a history of allergic reactions may also be more likely to develop a reaction. All patients should receive a test dose at least 10 minutes before the loading dose, although the test dose does not fully predict a patient’s risk. Fatal hypersensitivity reactions have occurred in patients who tolerated the test dose. Epinephrine, steroids, and facilities for cardiopulmonary resuscitation should be available in case such a reaction occurs. In order to administer in a more controlled setting, patients should be in the OR, intubated and ready for rapid cannulation and initiation of cardiopulmonary bypass before the test dose is administered. Delay adding aprotinin to the pump prime solution until after the loading dose has been safely administered. Hypotension is the most frequently reported sign of the hypersensitivity reaction.

- Death: Has been linked to an increased risk of death in observational studies.

- Heart failure: Has been linked to an increased heart failure in observational studies.

- Renal dysfunction: Has been linked to serious kidney damage in observational studies. Renal dysfunction (elevations of >0.5 mg/dL over baseline serum creatinine) may occur with use and may increase the need for dialysis in the perioperative period. Patients at greatest risk are those with pre-existing renal dysfunction (Cl_{cr} <60 mL/minute) or those receiving potential nephrotoxins (eg, aminoglycosides). Monitor renal function closely following administration.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Pregnancy Risk FactorB

Pregnancy ConsiderationsTeratogenic effects were not observed in animal studies. There are no adequate and well-controlled studies in pregnant women.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

>10%:

Central nervous system: Fever (15%)

Gastrointestinal: Nausea (11%)

1% to 10%:

Cardiovascular: Atrial flutter (6%), ventricular extrasystoles (6%), ventricular tachycardia (1% to 5%), heart failure (1% to 5%), arrhythmia (4%), supraventricular tachycardia (4%), bradycardia (1% to 2%), thrombosis (1% to 2%), bundle branch block (1% to 2%), cardiac arrest (1% to 2%), heart block (1% to 2%), hemorrhage (1% to 2%), myocardial ischemia (1% to 2%), pericardial effusion (1% to 2%), ventricular fibrillation (1% to 2%), shock (<1% to 2%)

Central nervous system: Agitation (1% to 2%), anxiety (1% to 2%), dizziness (1% to 2%), seizure (1% to 2%)

Endocrine & metabolic: Creatinine phosphokinase increase (2%), acidosis (1% to 2%), hyperglycemia (1% to 2%), hypervolemia (1% to 2%), hypokalemia

Gastrointestinal: Diarrhea (3%), dyspepsia (1% to 2%), gastrointestinal hemorrhage (1% to 2%)

Hematologic: Disseminated intravascular coagulation (DIC), leukocytosis (1% to 2%), prothrombin decreased (1% to 2%), thrombocytopenia (1% to 2%)

Hepatic: Jaundice (1% to 2%), hepatic failure (1% to 2%)

Neuromuscular & skeletal: Arthralgia (1% to 2%)

Renal: Serum creatinine increase of >0.5 mg/dL above baseline (high dose: 9%), oliguria (1% to 2%), tubular necrosis (1% to 2%), kidney failure (1%)

Respiratory: Hypoxia (2%), pulmonary hypertension (1% to 2%), pneumonia (1% to 2%), apnea (1% to 2%), cough increased (1% to 2%)

Miscellaneous: Sepsis (1% to 2%), multisystem organ failure (1% to 2%)

<1%: Anaphylactic reaction/hypersensitivity (no prior exposure: <0.1%; re-exposure within 6 months 5%; re-exposure >6 months <1%)

Postmarketing and/or case reports: Hemoperitoneum, skin discoloration

Drug Interactions

ACE Inhibitors: Aprotinin may diminish the antihypertensive effect of ACE Inhibitors. *Risk C: Monitor therapy*

Thrombolytic Agents: Aprotinin may diminish the therapeutic effect of Thrombolytic Agents. *Risk D: Consider therapy modification*

Test InteractionsAprotinin significantly increases aPTT and celite Activated Clotting Time (ACT) which may not reflect the actual degree of anticoagulation by heparin. Kaolin-based ACTs are not affected by aprotinin to the same degree as celite ACTs.

Monitoring ParametersBleeding times, prothrombin time, activated clotting time, platelet count, red blood cell counts, hematocrit, hemoglobin and fibrinogen degradation products; for toxicity also include renal function tests and blood pressure

Because aPTT and ACT are difficult to interpret with aprotinin use, the manufacturer recommends two different ways to administer heparin:

1). Fixed heparin dosing where a standard loading dose of heparin plus the quantity of heparin added to the prime volume of the CPB circuit should total at least 350 units/kg. Additional heparin should be administered based on patient's weight and duration of CPB.

2). Heparin dosing based upon a protamine titration method. A heparin dose response, assessed by protamine titration, should be performed prior to administration of aprotinin to determine the heparin loading dose.

Reference RangeAntiplasmin effects occur when plasma aprotinin concentrations are 125 KIU/mL and antikallikrein effects occur when plasma levels are 250-500 KIU/mL; it remains unknown if these plasma concentrations are required for clinical benefits to occur during cardiopulmonary bypass; **Note:** KIU = Kallikrein inhibitor unit

While institutional protocols may vary, a minimal celite ACT of 750 seconds or kaolin-ACT of 480 seconds is recommended in the presence of aprotinin. Consult the manufacturer’s information on specific ACT test interpretation in the presence of aprotinin.

Nursing: Physical Assessment/Monitoring**Monitor infusion site carefully.** Systemic hemodynamic monitoring is generally in effect when patients receive this drug. Continuous blood pressure monitoring is required. Sudden drops in blood pressure may occur. Observe for adequate fluid balance and adequate respiratory function.

Monitoring: Lab TestsBleeding times, prothrombin time, activated clotting time, platelet count, red blood cell counts, hematocrit, hemoglobin, and fibrinogen degradation products; for toxicity also include renal function.

Patient EducationYou will be unaware of the effects of this drug, however, you will be closely monitored at all times. **Breast-feeding precaution:** Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Injection, solution:

Trasylol®: 1.4 mg/mL [10,000 KIU/mL] (100 mL, 200 mL) [bovine derived]

Generic AvailableNo

ManufacturerBayer Corp (Biological and Pharmaceutical Division)

Mechanism of ActionBleeding from CABG surgery is thought to result from a systemic inflammatory response induced by the procedure. Contact of blood cells with the cardiopulmonary bypass (CPB) equipment leads to deregulated activation of the coagulation and fibrinolysis systems, with concurrent upregulation of proinflammatory cytokines. Aprotinin is a broad spectrum serine protease inhibitor that attenuates the coagulation, fibrinolytic and inflammatory pathways by interfering with the chemical mediators (thrombin, plasmin, kallikrein). Additionally, it protects platelet-expressed glycoproteins from mechanical shear forces. This preserves normal hemostatic activity through protease receptor-independent mechanisms (eg, via ADP, IIb/IIIa), while blocking CPB-induced thrombin-mediated aggregation.

Pharmacodynamics/Kinetics

Distribution: Extracellular space; renal phagolysosomes

Metabolism: Aprotinin is slowly degraded by lysosomal enzymes.

Half-life elimination: 2.5 hours (plasma); terminal: 10 hours

Excretion: Urine (25% to 40%; <10% as unchanged drug)

Dental Health: Effects on Dental TreatmentNo significant effects or complications reported

Dental Health: Vasoconstrictor/Local Anesthetic PrecautionsNo information available to require special precautions

Mental Health: Effects on Mental StatusMay cause confusion

Mental Health: Effects on Psychiatric TreatmentMay cause renal dysfunction; use caution with lithium and gabapentin; may rarely cause seizures; use caution with clozapine

Anesthesia and Critical Care Concerns/Other ConsiderationsBayer Pharmaceuticals Inc is suspending the marketing of aprotinin (Trasylol®) in the U.S. and Canada at the request of both the U.S. Food and Drug Administration (FDA) and Health Canada. Preliminary data from the now suspended, *Blood Conservation Using Antifibrinolytics: A Randomized Trial in a Cardiac Surgery Population (BART)* study in Canada, suggests an increased risk of death associated with aprotinin use when compared with other antifibrinolytic agents. In the study, hemorrhage-related deaths were observed more often in the aprotinin study population.

Aprotinin was associated with an increased risk of long-term mortality (5 years of evaluation after CABG surgery) following use during surgery (Mangano, 2007).

ALERT: U.S. Boxed WarningThe FDA-approved labeling includes a boxed warning. See Warnings/Precautions section for a concise summary of this information. For verbatim wording of the boxed warning, consult the product labeling or www.fda.gov.

Pronunciation(ar for MOE ter ol)

U.S. Brand NamesBrovana®

Pharmacologic Category Beta$_2$ Agonist

Use: Labeled IndicationsLong-term maintenance treatment of bronchoconstriction in chronic obstructive pulmonary disease (COPD), including chronic bronchitis and emphysema

Dosing: Adults **COPD:** Nebulization: 15 mcg twice daily; maximum: 30 mcg/day

Dosing: ElderlyRefer to adult dosing.

Dosing: Renal ImpairmentNo adjustment required.

Dosing: Hepatic ImpairmentNo dosage adjustment required, but use caution; systemic drug exposure prolonged (1.3- to 2.4-fold).

Administration: InhalationNebulization: Remove each vial from individually sealed foil pouch immediately before use. Use with standard jet nebulizer connected to an air compressor, administer with mouthpiece or face mask. Administer vial undiluted and do not mix with other medications in nebulizer.

StoragePrior to dispensing, store in protective foil pouch under refrigeration at 2°C to 8°C (36°F to 46°F). Protect from light and excessive heat. After dispensing, unopened foil pouches may be stored at room temperature at 20°C to 25°C (68°F to 77°F) for up to 6 weeks. Only remove vial from foil pouch immediately before use.

RestrictionsAn FDA-approved medication guide must be distributed when dispensing an outpatient prescription (new or refill) where this medication is to be used without direct supervision of a healthcare provider. Medication guides are available at http://www.fda.gov/cder/Offices/ODS/medication_guides.htm.

ContraindicationsHypersensitivity to arformoterol, racemic formoterol, or any component of the formulation

Warnings/Precautions

Boxed warnings:

- Asthma-related deaths: See "Concerns related to adverse effects" below.

Concerns related to adverse effects:

- Asthma-related deaths: **[U.S. Boxed Warning]: Long-acting beta$_2$-agonists may increase the risk of asthma-related deaths.** In a large, randomized clinical trial (SMART, 2006), salmeterol was associated with a small, but statistically significant increase in asthma-related deaths (when added to usual asthma therapy); risk may be greater in African-American patients versus Caucasians. Data is not available to determine whether rate of death is increased with long-acting beta$_2$-agonists in COPD setting.

- Bronchospasm: Rarely, paradoxical bronchospasm may occur with use of inhaled bronchodilating agents; this should be distinguished from inadequate response.

- Hypersensitivity reactions: Immediate hypersensitivity reactions (urticaria, angioedema, rash, bronchospasm) have been reported.

- Serious effects/fatalities: Do not exceed recommended dose; serious adverse events, including fatalities, have been associated with excessive use of inhaled sympathomimetics.

Disease-related concerns:

- Cardiovascular disease: Use with caution in patients with cardiovascular disease (eg, arrhythmia, hypertension, HF); beta-agonists may cause elevation in blood pressure, heart rate and result in CNS stimulation/excitation. Beta$_2$-agonists may also increase risk of arrhythmias and prolong QT_c interval.

- COPD: Appropriate use: Arformoterol should only be used for long-term maintenance treatment and should not be used as rescue therapy in treatment of acute episodes. It should not be initiated in patients with acutely deteriorating COPD or combined with other long-acting beta$_2$-agonists.

- Diabetes: Use with caution in patients with diabetes mellitus; beta$_2$-agonists may increase serum glucose.

- Hepatic impairment: Use with caution in patients with hepatic impairment; systemic clearance prolonged in hepatic dysfunction.

- Hyperthyroidism: Use with caution in patients with hyperthyroidism; may stimulate thyroid activity.

- Hypokalemia: Use with caution in patients with hypokalemia; beta$_2$-agonists may decrease serum potassium.

- Seizure disorders: Use with caution in patients with seizure disorders; beta$_2$-agonists may result in CNS stimulation/excitation.

Special populations:

- Pediatrics: Safety and efficacy have not been established in children.

Other warnings/precautions:

- Patient information: Patients using inhaled, short-acting beta$_2$-agonists should be instructed to discontinue routine use of these medications prior to beginning treatment; short-acting agents should be reserved for symptomatic relief of acute symptoms. Patients must be instructed to seek medical attention in cases where acute symptoms are not relieved or a previous level of response is diminished. The need to increase frequency of use may indicate deterioration of COPD, and treatment must not be delayed.

- Tolerance/Tachyphylaxis: Tolerance to the bronchodilator effect, measured by FEV$_1$, has been observed in studies.

Geriatric ConsiderationsIn clinical trials, no significant difference was seen in the AUC and C$_{max}$ between younger and older subjects. In addition, no significant difference in clinical response was noted.

Pregnancy Risk FactorC

Pregnancy ConsiderationsTeratogenic effects, decreased fetal weight and increased fetal loss were observed in animal studies. There are no adequate and well-controlled studies in pregnant women. Beta-agonists may interfere with uterine contractility if administered during labor. Use in pregnancy and/or during labor should be limited to situations where benefit outweighs risk to fetus.

LactationExcretion in breast milk unknown/use caution

Adverse Reactions

2% to 10%:

Cardiovascular: Chest pain (7%), peripheral edema (3%)

Central nervous system: Pain (8%)

Dermatologic: Rash (4%)

Gastrointestinal: Diarrhea (6%)

Neuromuscular & skeletal: Back pain (6%), leg cramps (4%)

Respiratory: Dyspnea (4%), sinusitis (5%), congestive conditions (2%)

Miscellaneous: Flu-like syndrome (3%)

<2%: Abscess, agitation, allergic reaction, arteriosclerosis, arthralgia, arthritis, atrial flutter, AV block, bone disorder, calcium crystalluria, cystitis, cerebral infarct, CHF, circumoral paresthesia, constipation, dehydration, dry skin, ECG changes, edema, fever, gastritis, glaucoma, glucose tolerance decreased, glycosuria, gout, heart block, hematuria, hyper-/hypoglycemia, hyperlipemia, hypokalemia, hypokinesia, inverted T-wave, kidney calculus, lung carcinoma, melena, MI, neck rigidity, neoplasm, nocturia, oral moniliasis, paradoxical bronchospasm, paralysis, pelvic pain, periodontal abscess, PSA increased, pyuria, QT interval increased, rectal hemorrhage, retroperitoneal hemorrhage, rheumatoid arthritis, skin discoloration, skin hypertrophy, somnolence, supraventricular tachycardia, tendinous contracture, tremor, urinary tract disorder, urine abnormality, viral infection, vision abnormalities, voice alteration

Metabolism/Transport Effects**Substrate** of CY2D6 (minor) and CYP2C19 (minor)

Drug Interactions

Alpha-/Beta-Blockers: May diminish the therapeutic effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Atomoxetine: May enhance the tachycardic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Beta-Blockers (Beta1 Selective): May diminish the bronchodilatory effect of Beta2-Agonists. Of particular concern with nonselective beta-blockers or higher doses of the beta1 selective beta-blockers. *Risk C: Monitor therapy*

Beta-Blockers (Nonselective): May diminish the bronchodilatory effect of Beta2-Agonists. *Risk D: Consider therapy modification*

Betahistine: May diminish the therapeutic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Cannabinoids: May enhance the tachycardic effect of Sympathomimetics. *Risk C: Monitor therapy*

Iobenguane I 123: Sympathomimetics may diminish the therapeutic effect of Iobenguane I 123. *Risk X: Avoid combination*

MAO Inhibitors: May enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Sympathomimetics: May enhance the adverse/toxic effect of other Sympathomimetics. *Risk C: Monitor therapy*

Tricyclic Antidepressants: May enhance the adverse/toxic effect of Beta2-Agonists. *Risk C: Monitor therapy*

Monitoring ParametersFEV$_1$, peak flow, and/or other pulmonary function tests; blood pressure, heart rate; CNS stimulation; serum glucose, serum potassium. Monitor for increased use of short-acting beta$_2$-agonist inhalers; may be marker of a deteriorating COPD condition.

Nursing: Physical Assessment/MonitoringMonitor therapeutic response and adverse reactions at the beginning and periodically throughout therapy. Assess other prescription and OTC medications the patient may be taking to avoid duplications and interactions. Assess knowledge/teach patient appropriate use and care of nebulizer, side effects, and symptoms to report.

Monitoring: Lab TestsFEV$_1$, peak flow, and/or other pulmonary function tests; serum glucose, serum potassium

Patient EducationThis drug is intended for chronic COPD use, not sudden onset of COPD symptoms. Inform prescriber of all prescription medications, OTC medications, or herbal products you are taking or before stopping this medication. Do not take any new medications without consulting prescriber. Use as directed. Do not use more frequently than ordered. Do not mix with other medications in your nebulizer. If you have diabetes, monitor your blood glucose levels carefully; can cause hyperglycemia. Maintain adequate hydration (2-3 L/day) unless instructed to restrict intake by prescriber. You may experience nervousness, tremor, headache, muscle cramps, trouble sleeping, dizziness, or tiredness. Use caution when driving or engaging in tasks requiring alertness until response to drug is known. Report rapid heart rate, chest pain, or palpitations; swelling of extremities or sudden weight gain of 3-5 pounds/week; back or leg pain; increased shortness of breath; or difficulty breathing. **Pregnancy/breast-feeding precautions:** Inform prescriber if you are or intend to become pregnant. Consult prescriber if breast-feeding.

Dosage FormsExcipient information presented when available (limited, particularly for generics); consult specific product labeling.

Solution for nebulization:

Brovana®: 15 mcg/2 mL (30s, 60s)

Generic AvailableNo

ManufacturerSepracor, Inc

Mechanism of ActionArformoterol, the (R,R)-enantiomer of the racemic formoterol, is a long-acting beta$_2$-agonist that relaxes bronchial smooth muscle by selective action on beta$_2$-receptors with little effect on cardiovascular system.

Pharmacodynamics/Kinetics

Onset of action: 7-20 minutes

Peak effect: 1-3 hours

Absorption: A portion of inhaled dose is absorbed into systemic circulation

Protein binding: 52% to 65%

Metabolism: Hepatic via direct glucuronidation and secondarily via O-demethylation; CYP2D6 and CYP2C19 (to a lesser extent) involved in O-demethylation

Half-life elimination: 26 hours

Time to peak: 0.5-3 hours
